**Thermo-electric Pyrometers.**—These depend upon the electromotive force developed when a junction of two dissimilar metals is heated. The couple used should show a steady increase in E.M.F. with rise in temperature, and should not be destroyed or show an alteration in E.M.F. on prolonged heating. These conditions are best fulfilled by couples made of the platinum series of metals, but owing to the high cost of these, "base" metal couples are now largely used, which can be renewed when necessary at a trifling expense. The upper limit of temperature at which a thermocouple may be used must be some degrees below the point at which destruction or change in E.M.F. would commence. Thermocouples in common use are platinum and rhodium platinum (10% Rh), which may be used to  $1400^{\circ}\text{C.}$  and generates an E.M.F. of 1.1 millivolts per  $100^{\circ}\text{C.}$ ; iron and constantan, upper limit  $900^{\circ}\text{C.}$ , E.M.F. 6.7 millivolts per  $100^{\circ}\text{C.}$ ; and two different nickel-chromium alloys (Hoskin's alloys), upper limit  $1100^{\circ}\text{C.}$ , E.M.F. 7.4 millivolts per  $100^{\circ}\text{C.}$  Various other couples are also used. It will be noted that the base-metal couples develop a much higher E.M.F. than those made from the platinum group. Most couples require protection from furnace gases, which would cause corrosion, and are provided with shields of silica, porcelain, fireclay, or other refractory material, which should be non-porous.

The indicator used with a thermocouple is usually a millivoltmeter, the range of which is determined by the couple used, and the temperature to be measured. The deflections shown when the couple is subjected to the standard temperatures enable the scale to be marked so as to read temperatures directly. Due allowance must be made for the temperature of the other junctions in the circuit, as the deflection, in general, depends upon the excess temperature of the heated junction over the "cold" junction or junctions. Errors in this direction may be avoided by (1) locating the cold junctions in oil in a thermos flask, so as to maintain a constant temperature; (2) by water-cooling the cold junctions; (3) by the use of compensating junctions (Peake and others); or (4) by compensated indicators (Bristol, Paul, Darling and others). For measuring special ranges—such as  $500^{\circ}$  to  $1000^{\circ}$ —an opposing E.M.F. from an external source is applied to the indicator, so that deflection does not commence until the junction has attained  $500^{\circ}$ . Instead of a millivoltmeter, the indicator may take the form of a potentiometer, in which the E.M.F. due to the junction is balanced against a known difference of potential (Northrup, Brown, Rosenhain and others), with the advantages that a delicate galvanometer may be used, and that the indications are independent of the resistance of the leads.

Continuous records of temperature may be obtained by photographic means (Roberts-Austen), a mirror galvanometer being used as indicator, and the spot of light directed on a sensitized paper moving at a known rate. Records in ink are obtained by depressing the pointer of the indicator at regular intervals, and causing it to make a dot in ink on a chart moving at a known rate, thus recording the deflection at any moment. In the "Thread" recorder (Cambridge and Paul Instrument Co.) an inked thread is pressed onto the chart; in Siemens' and Paul's recorders an inked ribbon is made to touch the paper; in Foster's recorder a special pen, at the end of the pointer, makes the dot. Recorders may be actuated by clock-work or electric motors.

The present practice is to employ thermo-electric pyrometers for all ordinary work up to  $1100$  or  $1200^{\circ}\text{C.}$ , when an accuracy of  $5$  or  $10^{\circ}$  suffices. This range embraces the temperatures involved in the heat treatment of ordinary steel and other metals and alloys.

**Resistance Pyrometers.**—These instruments were introduced by Siemens in 1871, and are still in use. The principal utilized is the increase in resistance to electricity shown by elementary metals when heated, which, in the case of platinum, has been proved by

Callendar to bear a definite relation to the rise in temperature. The working part consists of a coil of platinum wire, suitably shielded from furnace gases, and connected by platinum leads to one arm of a Wheatstone bridge, or to one branch of a differential galvanometer circuit. Compensation for the leads is effected by dividing the bridge at one end of the coil, so that the leads are in opposing arms (Siemens), or by dummy leads connected to the opposing arm of the bridge (Callendar). The reading consists in adjusting the bridge until a balance is obtained, when the resistance of the coil may be read, and the corresponding temperature deduced. For industrial use, indicators are provided in which the temperature is indicated on a dial when the bridge is adjusted to balance, so as to avoid calculation (Whipple, Siemens). Paul's indicator is a special form of ohmmeter, which requires no adjustment, and gives direct readings of temperature. Callendar's recorder is an automatic Wheatstone bridge, controlled by the galvanometer, a pen moving over the bridge wire giving an inked record. The Leeds-Northrup recorder achieves the same end by automatically balancing the pyrometer resistance against an opposing resistance in a differential galvanometer circuit. The resistance pyrometer is not now greatly used for industrial purposes, and is not suited for continuous use above  $1000^{\circ}\text{C.}$ , owing to an alteration in its indications due to the vaporising of the platinum (Crookes). It is more costly and difficult to use than a thermo-electric pyrometer, but is capable of giving closer readings under steady conditions.

**Total-Radiation Pyrometers.**—The energy radiated by a "black body" or full radiator is proportional to the fourth power of the absolute temperature, and if the energy be measured the temperature can be deduced from the above relation. An enclosure at a constant temperature, such as a furnace, gives black-body radiations, and enables the laws of radiation to be applied to measuring temperatures without serious error. In most existing forms of total-radiation pyrometers, the rays from the heated enclosure are directed on to a blackened thermal junction, the temperature of which is raised in the proportion of the energy received. A galvanometer in circuit with the junction serves to indicate, by its deflections, the relative amounts of energy absorbed by the junction, and its scale may therefore be marked to read temperatures directly by applying the fourth-power law.

In the form due to Férý, the rays are focussed by means of a concave mirror on to a small metal disc to which the junction is attached, a different focus being required for different distances from the furnace. In Foster's fixed-focus instrument a concave mirror is placed at the closed end of a narrow tube, the radiations being admitted through a diaphragm at the open end, and reflected on to a thermocouple. So long as the lines joining the extremities of the mirror with the edges of the diaphragm fall, if produced, within the heated source, the reading will be the same at any distance. In the form due to Thuring, and made by Paul, the rays are made to enter a polished cone, at the apex of which a thermal junction is placed. Various other modifications have been used by different makers. Records may be taken by attaching the junction to any form of thermo-electric recorder, and employing a chart divided in terms of the fourth-power law.

Radiation pyrometers are used for temperatures ranging from  $800^{\circ}$  to  $2000^{\circ}\text{C.}$ , and are particularly valuable under circumstances which preclude the introduction of an instrument into the furnace, as in the case of rotary cement kilns.

**Optical Pyrometers.**—In the most reliable of these instruments the brightness of the red rays from the heated source is matched against a standard, and calibration effected by applying Wien's laws for the distribution of energy in the spectrum. The red rays from standard and source are obtained either by spectroscopic means, or by viewing through monochromatic red glass. In Wanner's pyrometer, and the Cambridge optical pyrometer, a polarizing device is used for matching the colours, the position of the analyser being made to indicate the temperature. In the Holborn-Kurlbaum type, made by Siemens, the filament of an electric lamp is placed in the focal plane of a telescope, and the image of the heated object brought into the same plane. The adjustment consists in increasing or decreasing the brightness of the lamp by means of a rheostat in its circuit, until the filament disappears into the background, the current taken by the lamp being then read and the temperature deduced from a law connecting this current with temperature. In Férý's optical pyrometer equality of tint of standard and source is obtained by means of absorbing wedges of glass which slide over each other. In all these cases experience is needed to secure an exact match. Optical pyrometers of the "extinction" type depend upon the complete absorption of the rays from the heated object, which may be effected by lowering a wedge of dark glass in front of the image as received in a telescope, as in the "Wedge" pyrometer, or by using a layer of densely coloured liquid, the depth of which may be adjusted, as in Heathcote's pyrometer. The temperature calibration in both these cases is obtained by taking readings at standard temperatures, and marking the instruments accordingly.

No satisfactory recording apparatus for optical pyrometers has yet been devised. Their chief advantages are the indefinitely high range—from  $800^{\circ}\text{C.}$  upwards—and the possibility of obtaining readings from a considerable distance, and under conditions which would make it difficult to use any other type of pyrometer.

*Miscellaneous Devices.*—Amongst these may be mentioned: (1) Fusion pyrometers, which consist of pieces of materials of progressive melting-points, which are placed in the furnace, the temperature of which is represented by the melting-point of the highest in the series that undergoes fusion (Seger cones, Sentinel and Watkin's pyrometers); (2) Calorimetric or Water pyrometers, in which a piece of hot metal taken from the furnace is dropped into a known quantity of water, and the temperature deduced from the extent to which the water is heated; (3) Expansion pyrometers, based on the linear expansion of solids; and (4) the Clay-Contraction pyrometer of

Wedgwood. All these methods are at best approximate, and are not employed to the same extent as formerly, when accurate instruments were not available.

**QUARITCH, BERNARD ALFRED** (1871-1913), British bibliophile, son of Bernard Quaritch, the famous book-collector (see 22,711), was born Jan. 13 1871. He was educated at Charterhouse, and afterwards went to Leipzig and France. He joined his father's business in 1889, becoming its head in 1899. He played a very important part in the development of the firm; and purchased many rarities. He paid several visits to America, exhibiting there a large number of valuable books and MSS., and was a prominent purchaser at the Hoe sale (1911). He died at Brighton Aug. 27 1913.

**QUEBEC** (see 22,724\*).—Through the addition of Ungava in 1912 the area of the Canadian province of Quebec was doubled; and it became the largest in the Dominion. From 227,500 sq. m. in 1891 it had increased to 351,873 sq. m., which with the addition of 354,961 sq. m. of Ungava (known as New Quebec) gives a total area of 706,834 sq. m. (about one-fifth of Canada), of which 690,865 sq. m. are land and 15,960 sq. m. water.

The pop. was 2,003,232 in 1911. It was estimated in 1921 at 2,350,000. About 98% are Canadian-born, and of these over 80% are of French descent.

The number of Indians in the province (including Ungava) was 13,366. The principal tribes are: Iroquois at Caughnawaga, Lake of Two Mountains, and St. Regis (the Indians of Lorette are also of Iroquoian stock); the Montagnais, who are of Algonquin stock, at Persimis, Mingan, Lake St. John, and Seven Is.; the Abenakis, also of Algonquin stock, at Becancour and St. Francis; the Micmacs, of Algonquin stock, at Maria and Restigouche; and the Malecites, Algonquin, at Viger.

Quebec, the capital of the province, had in 1917 a pop. of 103,000. Montreal (pop. in 1917, 700,000) is the largest city in Canada.

Hull (pop. 28,392), just across the Ottawa river from Ottawa, is a lumber centre with a rapidly growing population. Three bridges connect it with Ottawa. The water-power of the Chaudière Falls furnishes power for electric railways and for the lighting system as well as for saw mills, pulp and paper mills and match factories.

Sherbrooke (pop. 22,583) is a close rival of Hull in industrial importance. It is located in the Eastern Townships, and its cotton and woollen factories and machine shops are amongst the largest in Canada. St. Hyacinthe (pop. 16,540) and Valleyfield have also large manufacturing establishments. Three Rivers (pop. 25,000) and Sorel have large shipping interests.

The Government of the province consists of a lieutenant-governor, a Legislative Council of 24 members appointed by the lieutenant-governor in council, a Legislative Assembly of 81 members elected by the people, and an Executive Council of 11 members chosen from the Legislative Assembly and the Legislative Council. The province is represented in the Dominion Parliament by 65 members in the House of Commons, and 24 senators. Either French or English may be used in addressing either House of Parliament, but French is the language largely used. The Civil law is the old French code existing prior to the conquest in 1760. The Criminal law is the same as exists throughout the Dominion.

**Education.**—Very difficult problems presented themselves to the statesmen of Canada in connexion with education in the province of Quebec, for not only are 85% of the population Roman Catholics but 80% speak French as their mother tongue; and had it not been for the wise provision made as a condition precedent to confederation the Protestant minority of 15% would have found themselves in a very uncomfortable position. The superintendent of education for the whole province, who is a non-political officer, is assisted by a council divided into a Roman Catholic and Protestant committee, each with a secretary who is the chief administrative officer for both classes of schools respectively. These committees meet separately as a rule, though they may, and occasionally do, meet together as a council. Each committee supervises the expenditure of the proportion of public money allotted to it, and each has its own normal school, appoints its own teachers and exercises control by inspectors over its own schools under the general law. The

legislative grant for higher education is divided according to population, the Protestants receiving one-seventh; of the grant for normal schools the Protestants receive one-third, and the elementary school branch is divided according to population. This is supplemented by a local municipal taxation through trustees. In 1918 there were 6,103 elementary schools, with a teaching staff of 8,189 and a total enrolment of 247,531; the expenditure on education was \$144,814,494.

A leading feature of the educational system is that all the public schools are denominational. Instruction in religion and morals given in Protestant schools is based on reading from the Old Testament, the Gospels and the Acts, and the children commit to memory portions of the Gospels and Psalms, together with the Apostles' Creed, the Decalogue and the Lord's Prayer. The religious instruction in the Roman Catholic schools is substantially part of the educational system, the Roman Catholic schools being controlled by the clergy, the episcopate forming, *ex officio*, one-half of the Catholic section of the council.

The chief universities are McGill at Montreal, founded in 1820; Laval (R.C.), founded in 1852, the headquarters being in the city of Quebec; and the newly founded university of Montreal, which was formerly the Montreal branch of Laval. McGill University stands very high academically, and has an especially well-equipped department of applied science. Laval has a professorial staff of 79, the university of Montreal 525, and McGill 322. The total numbers of students were in 1918 686, 5,460 and 2,444 respectively. Bishop's College, Lennoxville, is a small Anglican university in connexion with which is a school on the lines of an English public school. To McGill is affiliated the well-equipped agricultural college established at Ste. Anne de Bellevue by Sir William Macdonald, who is also noted for his liberal endowment of McGill University; and to Laval an agricultural school at Oka founded by the Trappist Fathers. There are numerous model and normal schools, the most important being that of Ste. Anne de Bellevue in connexion with Macdonald College.

**Agriculture.**—In recent years great progress has been made in agriculture, especially in dairying and live stock. The products of the soil are abundant, and large quantities of hay and oats are exported from Montreal and the city of Quebec; live stock, bacon, beef, eggs, butter, and especially cheese, to the value of millions of dollars yearly, are also shipped abroad. The field crops reach an annual value of \$271,600,000. Apples, plums and melons are produced in large quantities, together with many varieties of small fruits. Nearly 87,000,000 is realized annually from the maple trees in sugar and syrup. In 1920 there were 813 butter and cheese factories in operation. More than 92,000,000 lb. of butter and cheese, worth over \$35,000,000, are produced each year. Fully two-thirds of the tobacco grown in the Dominion comes from Quebec. The live stock of the province was in 1920 valued at more than \$205,000,000, and the total annual value of the field crops, principally hay, oats, barley, and some wheat, at about \$305,000,000.

**Forests and Lumber.**—Quebec, though second to Ontario in the production of lumber, exceeds it in the value of its pulp and paper products. Of the enormous forest area but a small portion has been cut over, and since Quebec has been a pioneer in scientific methods of forest conservation, copying the method of old France, the timber resources promise to be maintained indefinitely. In the N. the predominating trees are pine, spruce, fir, and other coniferous varieties, while farther S. appear maple, poplar, basswood, oak and elm trees and many other hardwoods. The value of the lumber cut in 1918 was \$20,916,604, of which spruce formed 66·3% of the output and white pine 13·1, the other commercial varieties in a smaller way being hemlock, balsam fir, birch and cedar. The capital invested in the lumbering industry amounted to \$57,201,820.

**Fish and Fur.**—The value of the annual catch of fish is estimated at \$3,000,000, the industry employing more than 3,000 men. Fish hatcheries have been established by the Dominion Government at several places for the purpose of stocking the lakes and rivers of the province. With considerable tidal waters along its coast Quebec may be regarded as one of the Maritime provinces. The principal fish are cod, lobsters, herring, salmon and mackerel. The mainland waters abound in trout, pickerel, whitefish, pike and sturgeon.

The forests, especially in the northern part, abound in game, both fur-bearing and otherwise. Nearly 200,000 sq. m. of territory in

\* These figures indicate the volume and page number of the previous article.

Quebec have been set apart by the Legislature for forest reserve and for the preservation of fish and game. Quebec is scarcely surpassed in Canada in its interest for sportsmen. In the Laurentides National Park, a district of 2,640 sq. m. N. of Quebec, caribou, partridge and trout are found in abundance. Bear and moose are also numerous.

**Minerals.**—Of the economic mineral product, cement alone yields \$3,000,000 annually. Molybdenite was mined extensively; during the World War, in the district of Quyon, Pontiac county, this mine becoming the largest producer in the world. Magnesite, found in the vicinity of Grenville, Argenteuil county, was also a valuable wartime mineral. The annual production of minerals in Quebec is valued at about \$23,000,000.

**Manufactures.**—Quebec ranks next to Ontario in the amount and value of its manufactures. There is limitless water-power almost everywhere, and at Shawinigan and Valleyfield power is being developed for commercial purposes. The chief manufactures are sugar, woollen and cotton goods, pulp and paper, tobacco and cigars, furs and hats, machinery, leather goods, boots and shoes, railway cars, rifles, musical instruments, cutlery and gunpowder. The annual value of the manufactured products of the province has reached \$920,000,000. The pulp mills in 1918 produced 288,952 tons valued at \$12,018,258, and the total product of all mills, paper and pulp, was valued at \$19,620,051. Paper of all kinds was manufactured to the extent of \$27,546,791, of which \$17,500,000 was newsprint. The total capital invested amounted to \$24,490,175, and 11,793 persons employed in the industry received \$11,546,596 in salaries and wages.

**Communications.**—The province is well provided with railways. The headquarters of the Canadian Pacific railway is at Montreal, and various lines of this railway connect Montreal with Toronto, Ottawa, Winnipeg, Vancouver, Quebec and St. John. The Canadian National railways connect Montreal with Halifax, passing across the St. Lawrence at the city of Quebec, and the line from Moncton, in New Brunswick, to Prince Rupert, in British Columbia, also crosses the St. Lawrence at the city of Quebec, and proceeds on its way through the northern part of the province. The National lines connect various local points, and by means of the old Grand Trunk system reach important centres in the United States, while there are a number of other railway companies, with lines running in various directions, especially in the extreme eastern section of the province.

Both Montreal and Quebec are connected by steamship during the summer months with all parts of the world. The St. Lawrence route, which by reason of its shortness is a favourite both for freight and passengers proceeding to Europe, has been rendered perfectly safe for navigation. During the summer season steamers ply on the rivers and inland waters, carrying a great deal of freight and taking care of the tourist trade.

(W. L. G.)

**QUEBEC** (see 22.727), the oldest city in the Dominion of Canada, had a pop. of 78,710 in 1910 and 116,850 in 1920. Quebec had for some years prior to 1911 been displaced by Montreal in the shipping trade, but after 1911 the older port

steadily improved its commercial and industrial position. As a manufacturing centre Quebec has profited by the cheap electric power supplied from the Shawinigan and Montmorency Falls. The harbour has been improved, and the largest dry-dock in the world has been built at a cost to the Dominion Government of \$7,000,000. Important factors contributing to the increased commercial importance of Quebec were the successful completion of the famous Quebec bridge, and the building of the Grand Trunk Pacific railway from Prince Rupert on the west coast of Canada to Quebec on the east. The distance from Quebec to Winnipeg by this railway is 145 m. shorter than that from Montreal to Winnipeg by any other line. The Quebec bridge, connecting the north and south shores of the St. Lawrence river at Cap Rouge, 9 m. from the centre of the city, was completed in 1917 by the St. Lawrence Bridge Co. for the Dominion Government. This achievement marked the end of more than 10 years of effort, two accidents to portions of the huge structure having delayed the work in 1907 and again in 1917. The Quebec bridge is larger than the Forth bridge in Scotland, which was previously the world's largest bridge. Its total length is 3,239 ft., the cantilever span is 1,800 ft. long and the suspended span 640 ft. long. The weight of the suspended span is 5,510 tons. The completion of the bridge made possible the running of six railways simultaneously into Quebec from the south shore. Quebec has always been a base of supplies for a large region of mines, lumber camps and farms, but has gained further importance in this regard of late years owing to the rapid development of the water supplies of the province for purposes of electric power, particularly for the manufacture of wood pulp. The Lake Saint John district north of the city, a centre for pulp-milling, finds its outlet through Quebec. Buildings erected recently in Quebec include a large Government technical school, the erection and equipment of which cost \$150,000.

**QUILLER-COUCH, SIR ARTHUR THOMAS** (1863— ), English man of letters (see 22.750), published subsequently to 1910 *The Vigil of Venus and other poems* and an anthology, *The Oxford Book of Victorian Verse* (1912), as well as books *On the Art of Writing* (1916), and *On the Art of Reading* (1920); a memoir of Arthur John Buller (1917); a volume of Shakespearean studies in 1918; *Hocken and Hunken, a new Tale of Troy* (1912); and various collections of short stories, including *Hicky-Nan, Reservist* (1915).

**RACHMANINOFF, SERGEI VASILIEVICH** (1873- ), Russian composer and pianist, was born at Omega, in Russia, March 20 1873; his grandfather, an excellent pianist, had been a pupil of the Irish musician John Field. He began his studies under his mother, but at nine he became a pupil of Anna Ornatskaya. In 1882, however, the Rachmaninoff family removed to St. Petersburg, and Sergei entered the Conservatorium, where he remained till 1885, when, on the family again removing to Moscow, he joined the Conservatorium there, and was on terms of friendship with Scriabin, Siloti, Taneyeff and Arensky. When, in 1892, Rachmaninoff left the Conservatorium, he won the large gold medal for a one-act opera *Aleksa* and followed it by many other works. About 1893 he composed a pianoforte suite, another for two pianos, a dozen songs, his first piano concerto, the symphonic picture *The Rock* and the elegiac trio on the death of Tchaikovsky. Next there followed his first symphony, produced by Glazounoff at St. Petersburg. In 1897-8 Rachmaninoff became conductor of Mamontoff's private opera, a post he resigned after the season, and in 1899 he came to London to conduct a Royal Philharmonic concert. A second piano suite, another concerto and a violoncello sonata were quickly composed, and were followed by the one-act opera *The Miser Knight* (Moscow 1900, Boston 1910) and *Francesca da Rimini* (Moscow, same evening); during 1904-6 he directed the Moscow Opera, and from 1906 to 1908 he lived in Dresden as composer and pianist, visiting Paris in 1907. In 1909-10 he visited the United States for the first time, and then returned to Russia, where he wrote *The Island of Death*, the D minor piano Sonata, and the third and fourth piano concertos (1909 and 1917). In 1912 he produced *The Bells*, which was produced in Liverpool by Sir Henry J. Wood in 1921. Among his other compositions *Spring*, for chorus and orchestra, is particularly noteworthy, and his devotional music includes a wonderful setting of the Liturgy of St. Chrysostom (1910). In 1917 Rachmaninoff left Russia, and in 1918 he settled in New York.

**RADIOACTIVITY** (see 22,793\*).—Among points of special interest that have arisen since the earlier article was written may be mentioned the preparation of metallic radium by Mme. Curie and Debierne by electrolysis of a radium salt with a mercury cathode. Radium resembles metallic barium, melts at about 700° C. and is rapidly attacked when exposed to the air.

The atomic weight of radium was found by Mme. Curie to be 226.45, using for the purpose about 0.4 gram of pure radium chloride. A recent careful redetermination by Hönigschmid with about one gram of radium gave a value 225.9 and is probably correct to 1 in 1,000. An International Radium Standard consisting of about 22 milligrams of pure radium chloride has been prepared by Mme. Curie, and is preserved in the Bureau International des Poids et Mesures at Sèvres, near Paris. Secondary radium standards have been issued to all governments who wished to purchase them. These have been calibrated by  $\gamma$ -ray methods both in Vienna and Paris and are supposed to be correct within 1 in 200. During the last few years the purchase and sale of radium have generally been conducted on certificates given in terms of this international standard.

The wide use of radium for therapeutic purposes, and its high cost—from £25 to £30 per milligram element—have led to close search for uranium deposits. The amount of radium in an old mineral is always proportional to its content of uranium in the ratio of 3:3 parts of radium by weight to 10 million parts of uranium. Consequently an old mineral containing 1,000 kgm. of uranium should contain 330 milligrams of pure radium. Initially several grams of radium were separated from the uraninite deposits in Joachimsthal, Bohemia, and some of the material, which was the property of the Austrian Government, was generously loaned to representative workers in radioactivity in England. A part of this radium is in the charge of the Radium

Institute of Vienna, which is specially devoted to radioactive investigations. The increasing demand for radium has led to the working of low-grade uranium ores on a large commercial scale. Much of the radium to-day is derived from the mineral carnotite, of which there are extensive deposits in Colorado and other parts of the United States. Although the carnotite contains only a few per cent of uranium and a correspondingly small quantity of radium, the separation of the latter is a profitable industry operating on a large scale. Large quantities of radium were employed by the Allies during the World War for night compasses, gun-sights, etc. The radium is mixed with phosphorescent zinc sulphide to form a paint which becomes continuously luminous, but, owing to the destruction of the zinc sulphide by the rays, this luminosity gradually decays.

**Radium Emanation.**—The atomic weight of the radium emanation is now known to be  $226 - 4 = 222$ , as was inferred earlier. This was confirmed by direct weighing with micro-balance by Ramsay and Gray.

The radium emanation has proved of great service not only in radioactive researches but also in therapeutic work. The radium salt is dissolved in an acid solution and the emanation is pumped off with the large quantity of hydrogen and oxygen liberated by the action of the radiations on water. After sparking the mixture, the emanation can be purified by condensation with liquid air. A very intense source of  $\beta$  and  $\gamma$  radiation can be obtained by introducing the purified emanation into fine capillary tubes. Such emanation needles have been widely used for therapeutic purposes, while the use of very thin-walled tubes provides a powerful line source of  $\alpha$  rays. The  $\beta$  and  $\gamma$  activity of such tubes rises to a maximum about four hours after introduction of the emanation and then decays with the period of the emanation, viz. 3.85 days. The quantity of emanation liberated from one gram of radium is called a *curie* and from one milligram a *millicurie*. The quantity of radium emanation in a tube can be accurately determined by comparison of its  $\gamma$ -ray activity with that of a radium standard, since the penetrating  $\gamma$  rays, both from the radium and the emanation in equilibrium, arise mainly from the same product radium C.

As regards other radioactive substances large quantities of mesothorium have been obtained as a by-product in the separation of thorium from monazite sands. This substance, which is half transformed in about 6.7 years, emits only  $\beta$  rays, but gives rise to radiothorium and subsequent products which emit  $\alpha$  rays and penetrating  $\beta$  and  $\gamma$  rays. As a source of powerful  $\beta$  and  $\gamma$  radiation, this substance is very analogous to radium and can be obtained in about the same concentration. Since radium and mesothorium are isotopic elements, they are always separated together. Most commercial sources of thorium contain also uranium and radium, and consequently radium is always separated with the mesothorium and in relative amount depending upon the proportion of uranium to thorium in the mineral. Since mesothorium has a radioactive life short compared with radium, it commands a smaller price. The amount of mesothorium is standardized by comparison of its  $\gamma$ -ray effect with a radium standard.

Mme. Curie separated the polonium from several tons of pitchblende and obtained an exceedingly active preparation of a few milligrams, but was unable to obtain it in a pure state, although several of its spectrum lines were detected. It was hoped by this experiment to decide whether polonium was transformed directly into lead, but this was found difficult to establish owing to the presence of impurities with the very small quantity of polonium.

The three types of radiation, known as the  $\alpha$ ,  $\beta$ ,  $\gamma$  rays, emitted by radioactive substances are analogous in many respects to the types of radiation observed when a discharge passes through a vacuum tube, but are of much more penetrating character. It may be noted here that for the electrons in a vacuum tube to obtain the velocity of the swift  $\beta$  rays from radium, a potential difference of at least two million volts would have to be applied. The very penetrating  $\gamma$  rays are identical in all respects with X rays of very short wavelength. Intense  $\gamma$  rays are only observed in substances which emit swift  $\beta$  particles, and apparently owe their origin to the passage of the swift  $\beta$  particle through the distribution of electrons surrounding the atomic nucleus. To produce X rays as penetrating as the  $\gamma$  rays, about two million volts would have to be cut on the discharge tube.

The  $\alpha$  rays, shown in 1903 by Rutherford to consist of a stream of positively charged atoms projected with high velocity, are now known to consist of charged atoms of helium which are projected with velocities of about 10,000 m. per second. While the majority of products break up with the expulsion either of an  $\alpha$  particle or a swift  $\beta$  particle, in a few cases no detectable radiation has been observed. Such products were at first called "rayless" products, but the sequence of

\* These figures indicate the volume and page number of the previous article.

chemical properties, discussed later, shows that a  $\beta$  particle must be liberated but at too low a speed to detect with certainty. Actinium and mesothorium are examples of such products.

A number of new products have been discovered, particularly in the uranium and actinium series. The results are included in the appended table of radioactive elements.

TABLE OF RADIOACTIVE ELEMENTS

Element	Atomic Weight	Atomic Number	T	Rays	Range cms. $\alpha$ rays (15° and 760 mm.)
<i>Uranium-Radium Series.</i>					
Uranium I.	238.18	92	$4.5 \times 10^8$ yrs.	$\alpha$	2.50
Uranium X <sub>1</sub>	234	90	23.8 days	$\beta, \gamma$	—
Uranium X <sub>2</sub>	234	91	1.15 min.	$\beta, \gamma$	—
Uranium II.	234	92	about $2 \times 10^6$ yrs.	$\alpha$	2.90
Uranium Y (3 per cent)	230	90	24.6 hrs.	$\beta$	—
Ionium	230	90	about $9 \times 10^4$ yrs.	$\alpha$	3.07
Radium	226	88	1700 yrs.	$\alpha$	3.52
Radium Emanation	222	86	3.85 days	$\alpha$	4.16
Radium A	218	84	3.05 min.	$\alpha$	4.75
Radium B	214	82	26.8 min.	$\beta, \gamma$	—
Radium C	214	83	19.5 min.	$\alpha, \beta, \gamma$	6.94
Radium D	210	82	16 yrs.	$\beta, \gamma$	—
Radium E	210	83	4.85 days	$\beta, \gamma$	—
Radium F (Polonium)	210	84	136.5 days	$\alpha$	3.83
Radium G (end-product uranium-lead)	206	82	—	—	—
<i>Thorium Series.</i>					
Thorium	232.1	90	$2.2 \times 10^{10}$ yrs.	$\alpha$	2.72
Mesothorium 1	228	88	6.7 yrs.	$\beta, \gamma$	—
Mesothorium 2	228	89	6.2 hrs.	$\beta, \gamma$	—
Radiothorium	228	90	1.90 yrs.	$\alpha$	3.87
Thorium X	224	88	3.64 days	$\alpha$	4.30
Thorium Emanation	220	86	54 secs.	$\alpha$	5.00
Thorium A	216	84	0.14 sec.	$\alpha$	5.70
Thorium B	212	82	10.6 hrs.	$\beta, \gamma$	—
Thorium C	212	83	60 min.	$\alpha$	4.80
Thorium D	208	81	3.2 min.	$\beta, \gamma$	8.60
Thorium E (end-product thorium-lead)	208	82	—	—	—
<i>Actinium Series.</i>					
Protoactinium	230	91	about $10^4$ yrs.	$\alpha$	3.31
Actinium	226	89	20 yrs.	$\beta$	—
Radioactinium	226	90	19 days	$\alpha$	4.6
Actinium X	222	88	11.2 days	$\alpha$	4.26
Actinium Emanation	218	86	3.9 secs.	$\alpha$	5.6
Actinium A	214	84	.002 sec.	$\alpha$	6.3
Actinium B	210	82	36 min.	$\beta, \gamma$	—
Actinium C	210	83	2.16 min.	$\alpha$	5.15
Actinium D	206	81	4.76 min.	$\beta, \gamma$	—
Actinium E (end-product actinium-lead)	206	82	—	—	—

In the table T is the time-period of a product or the time required for the product to be half transformed. It will be seen that the value of T, which is a measure of the relative stability of atoms, varies between  $2.2 \times 10^{10}$  years (Thorium) and .002 second (Actinium A). The atomic weights and atomic numbers of uranium, radium, uranium-lead, thorium, thorium-lead have been directly determined. The atomic weights and atomic numbers of the others are deduced on the assumption that the expulsion of an  $\alpha$  particle (helium atom) of charge 2 and mass 4 lowers the atomic number of the succeeding element by 2 units and the atomic weight by 4. The expulsion of a  $\beta$  particle raises the atomic number by 1 unit, but it is not supposed to influence the atomic weight to a detectable degree.

**Branch. Products.**—In the great majority of cases each of the radioactive elements breaks up in a definite way, giving rise to one  $\alpha$  or  $\beta$  particle and to one atom of the new product. Un-

doubted evidence, however, has been obtained that in a few cases the atoms break up in two or more distinct ways, giving rise to two or more products characterized by different radioactive properties. A branching of the uranium series was early demanded in order to account for the origin of actinium. While the latter is always found in uranium minerals in constant proportion with the uranium, Boltwood showed that the activity of the actinium with its whole series of  $\alpha$ -ray products in a uranium mineral was much less than that given by a single  $\alpha$ -ray product of the main radium series. The head of the uranium series is believed to be uranium Y, the branch product of the uranium series first observed by Antonoff. The branching is supposed to occur in the product uranium X<sub>1</sub>, 4% going into the actinium branch and the other 96% into the main uranium series. The atomic weights of actinium given in the table are calculated on this basis. The recently discovered product, *protoactinium*, is the hitherto missing link between uranium Y and actinium.

The most striking cases of branching occur in the "C" products of radium, thorium and actinium, each of which breaks up in two or more distinct ways. In the case of radium C, a new substance called radium C<sub>2</sub> was obtained by recoil from a nickel plate coated with radium C. This product emitted only  $\beta$  rays and had a period of 1.4 minutes. Fajans estimated that the amount of the product was only 1/3,000 of that of radium C. To account for these results, the following scheme of transformation has been proposed:—

where in the main branch a  $\beta$  particle is first expelled, giving rise to radium C, which emits an  $\alpha$  particle. The reverse process is assumed to take place in the other branch. Radium C, which emits a swift  $\alpha$  particle, is supposed to have an exceedingly short period of transformation. It is uncertain whether the radium C<sub>2</sub> branch ends after the expulsion of a  $\beta$  particle. The resulting product is an isotope of lead like radium D in the main branch.

In the case of thorium C, two sets of particles are observed, one-third of the total number of range 5.0 cms., and the remainder of range 8.6 centimetres. Recently another set of rays, about 1/10,000 of the total, has been found by Rutherford and Wood to have the great range in air of 11.3 cms. and has been shown to consist of  $\alpha$  particles. These results suggest that the thorium C atom breaks up in three distinct ways, each marked by the expulsion of an  $\alpha$  particle with characteristic but different velocity. Marsden showed that actinium C emits two sets of particles, 99.84% of range 5.15 cms., and 16% of range 6.4 cms., indicating a dual transformation of actinium C. It is quite possible that a close examination of radioactive substances may reveal other examples of such complex methods of transformation, for, after the violent explosion that occurs during the breaking-up of an atom, more than one state of temporary equilibrium may be possible for the residual atom.

**Relation between Range of  $\alpha$  Rays and Period of Transformation.**—We have seen that each  $\alpha$ -ray product emits a particle of characteristic velocity which have a definite range in air. It was early observed that there appeared to be a connexion between the period of transformation of a product and the velocity of the  $\alpha$  particles emitted. The shorter the period of transformation, the swifter is the velocity of expulsion of the  $\alpha$  particle. This relation was brought out clearly by the measurements of Geiger and Nuttall, where it was shown that if the logarithm of the range was plotted against the logarithm of  $\lambda$ , the constant of transformation, all the points lay nearly on a straight line. A similar result has been observed for the thorium and actinium products. This relation is at present purely empirical and no doubt only approximate, but it is of great interest as indicating a possible relation between the stability of the radioactive nucleus and the velocity of the expelled helium atom. This relation has proved very useful in forming estimates of the period of transformation of ionium and other substances before the results of more direct determinations were available. From this relation also the change which gives rise to the swift  $\alpha$  particle of radium C is believed to be exceedingly rapid, and a similar conclusion is drawn for the products emitting the very swift  $\alpha$  particles from thorium C.

**Chemistry of the Radioelements.**—Apart from uranium and thorium and a few special cases like radium and polonium, the radioactive products of short life exist in too small quantity to examine by the ordinary chemical methods, but, by the use of the radioactive method of analysis, it was possible to form some idea of their chemical behaviour. Certain very interesting points

soon came to light. Soddy found that the two elements, radium and mesothorium, although quite dissimilar in radioactive properties, were chemically so identical that it was impossible by chemical methods to separate one from the other. Other cases of this kind had long been suspected, viz. thorium and radiothorium, thorium and ionium, and radium D and lead. He named such inseparable elements isotopes, since they appeared to occupy the same place in the periodic classification of the elements.

Following the chemical study of the radioelements by Soddy, Fleck and von Hevesy, an important generalization connecting the chemical properties of the radioelements was announced independently in 1913 by Russell, Fajans and Soddy. After the expulsion of an  $\alpha$  particle from a radioactive substance, the resulting product shifts two places in the direction of diminishing mass when the elements are arranged in families according to the Mendeleef classification.

The expulsion of a  $\beta$  particle causes a shift of one place in the opposite direction. For example, by the loss of an  $\alpha$  particle from ionium of group IV., the resulting product, radium, belongs to group II., while the loss of another particle gives rise to the emanation which occupies the group O, and so on. By this method the chemical properties of all the known radioelements can be predicted from a knowledge of the radiations emitted from the products. This generalization can be viewed from another important standpoint. From the work of Moseley, the properties of an element are defined by the atomic number which is believed to represent the resultant positive charge on the nucleus. The loss of an  $\alpha$  particle of mass 4, carrying two positive charges, lowers the atomic number by two units, while the emission of a  $\beta$  particle raises it by one unit. On looking through the table of the radioelements given above, it will be seen that many of them can be grouped under the same atomic number. These represent the radioactive isotopes, of which some of the more important are given below, preceded by the atomic numbers:—

- 81 Tellurium (204), thorium D (208), actinium D (206).
- 82 Lead (207), uranium-lead (206), thorium-lead (208), radium D (210), thorium B (212), radium B (214), actinium B (210).
- 83 Bismuth (208), radium E (210).
- 84 Polonium (210), thorium A (216), radium A (218), actinium A (214).
- 86 Radium emanation (222), thorium emanation (220), actinium emanation (218).
- 88 Radium (226), thorium X (224), mesothorium (228), actinium X (222).
- 90 Thorium (232), radiothorium (228), ionium (230), uranium X<sub>1</sub> (234), uranium Y (230), radioactinium (226).

It will be seen that many of the radioactive elements are isotopic with known chemical elements. These radioactive isotopes differ not only in atomic weight but also in radioactive properties. The isotopes of lead are of special interest as they include the end-products of the uranium, thorium and actinium series—a question that will be discussed more fully later. It has been found that the X-ray spectrum of the  $\gamma$  rays from radium B is identical with that given by ordinary lead exposed to cathode rays in a vacuum tube, a result to be anticipated from the identity of their atomic number. It is of interest to note that polonium is a new type of chemical element which has no counterpart among the ordinary inactive elements.

**Transformation of Uranium.**—In 1900 the late Sir W. Crookes found that the  $\beta$ -ray activity of ordinary uranium could be removed by a single chemical operation and concentrated in an active residue. This is due to the separation of the product uranium X, of period 24 days, which emits  $\beta$  and  $\gamma$  rays. A complete analysis of the transformations of uranium has been a matter of much difficulty. Boltwood showed that the  $\alpha$ -ray activity of uranium was about twice as great as that of a corresponding  $\alpha$ -ray product in the uranium-radium series, indicating that uranium contained two successive  $\alpha$ -ray products. This was confirmed by Geiger, who showed that the  $\alpha$  rays from uranium consisted of two groups with ranges 2.5 and 2.9 cms. respectively. These two  $\alpha$ -ray substances, called uranium I. and uranium II., are isotopic, with atomic weights 238 and 234 respectively. The latter, whose period is estimated at about 2 million years, exists in relatively very small quantity compared with uranium I. Following the generalization connecting the radiations and chemical properties of the series of radioelements, Fajans predicted the presence of a new product with properties analogous to tantalum, and promptly succeeded in isolating it

experimentally. The new product uranium X<sub>2</sub>, sometimes called brevium, has a period of 1.15 minutes and emits swift  $\beta$  rays. The series of changes is thus:—

We have seen that Antonoff discovered another  $\beta$ -ray substance called uranium Y, separated with uranium X<sub>1</sub>, which has a period of 24.6 hours. This exists in too small quantity to be in the main line of succession, but is to be regarded as a branch product of uranium X<sub>1</sub> and is believed to be the first element of the subsidiary actinium series.

Rutherford and Geiger found the number of  $\alpha$  particles emitted per gram of uranium per second to be  $2.37 \times 10^4$ . From this the period of uranium is calculated to be about 6,000 million years.

**Thorium.**—The first product observed in thorium was the emanation of period 54 seconds, and this gives rise to the active deposit, which has been shown to consist of at least four successive products called thorium A, B, C, D. The emanation, after the emission of an  $\alpha$  particle, changes into a product of very short life emitting  $\alpha$  rays. Its period was found by Geiger and Moseley to be about 1/10 second. The succeeding product, thorium B, emits only weak  $\beta$  and  $\gamma$  rays with a period of 10.6 hours, changing into thorium C of period one hour. We have seen that thorium C breaks up in a complex way, emitting three distinct groups of particles. Thorium D is readily separated from C by the method of recoil. It emits penetrating  $\beta$  and  $\gamma$  rays with a half-period of 3 minutes. The active deposit as a whole decays ultimately with the period of thorium B, viz. 10.6 hours.

A special interest attaches to the product thorium X, first separated by Rutherford and Soddy, since experiments with it laid the foundation of the general theory of radioactive transformations.

A close analysis of thorium has led to the discovery by Hahn of a number of other important products. When the thorium X is separated from a thorium mineral or old thorium preparation, there appears with it another product called mesothorium 1, of period 6.7 years, which is transformed with the emission of weak  $\beta$  rays into mesothorium 2, of period 6 hours, which emits swift  $\beta$  particles and penetrating  $\gamma$  rays. This changes into an  $\alpha$ -ray product, radiothorium, of period 2 years, which is transformed into thorium X.

Radiothorium is an isotope of thorium, while mesothorium 1 is an isotope of radium. The radiothorium can readily be separated from a solution of mesothorium and obtained in a concentrated form. Mesothorium when first separated would show a very weak activity, but in consequence of the growth of its subsequent product radiothorium, its activity would increase for several years. After reaching a maximum it would ultimately decay with the period of mesothorium, viz. 6.7 years.

**Actinium.**—Actinium of period about 20 years is believed to emit weak  $\beta$  rays changing into radioactinium, an  $\alpha$ -ray product of period 19 days, first separated by Hahn. This changes into actinium X, an  $\alpha$ -ray product of period 11 days, discovered by Godlewski. Then follows the actinium emanation of period 3.9 seconds, which gives rise to four further products named actinium A, B, C, D. Actinium A has the shortest life of any product whose rate of transformation has been directly determined. Its period, as determined by Geiger and Moseley and Fajans, is .002 second. After emitting an  $\alpha$  particle, A changes into B, a product of period 36 minutes emitting weak  $\beta$  and  $\gamma$  rays, analogous to thorium B. Actinium C of period 2.16 minutes undergoes a complex transformation, giving rise to two distinct groups of  $\alpha$  particles. The main branch gives rise to actinium D of period 4.8 minutes, which is readily isolated by the recoil method. Actinium D, which emits  $\beta$  and  $\gamma$  rays, is analogous in all respects to thorium D.

In the discussion above on branch products it has been shown that the parent of actinium, called protoactinium, has been recently isolated by Hahn and Soddy. This substance emits  $\alpha$  rays and has an estimated period of 10,000 years. We have seen that the actinium series is believed to have its origin in a dual transformation of uranium X. The first branch product, representing about 4% of the total, is believed to be uranium Y, a  $\beta$ -ray product of period one day. This is directly transformed into protoactinium.

While very active preparations of actinium have been made, it has not been found possible to separate it entirely from the rare earths with which it is mixed. Protoactinium exists in much larger amounts and should be ultimately obtained in a pure state.

**End-products of the Transformations (re-stated).**—After the radioactive transformations have come to an end, each of the elements uranium, thorium and actinium should give rise to an end or final product, which may be a known element or an unknown element of very slow period of transformation. Since the expulsion of an  $\alpha$  particle lowers the mass of the atom by four units, and there are eight  $\alpha$ -ray products, the atomic weight of the end atom should be  $238 - 8 \times 4 = 206$ . The atomic weight of radium by this rule should be  $238 - 3 \times 4 = 226$ , a result in good accord with experiment. The atomic weight of the end-product of uranium is close to that of lead, viz. 207, and Boltwood early suggested that lead was the end-product of radium. Since in

old minerals the transformations have been in progress for intervals measured by millions of years, the end-product should collect and be an invariable companion of the radioelement. Boltwood showed that lead is always present in old radioactive minerals and in amount to be expected from their uranium content and geologic age.

In recent years this problem has been definitely attacked in the light of the chemical generalization already given. It was clear from this that the end-products of uranium, thorium and actinium should all be isotopes of lead but with atomic weights 206, 208 and 206 respectively. In other words, uranium-lead if uncontaminated with ordinary lead should show a smaller atomic weight than ordinary lead (207), while thorium-lead should give a higher value. By the work of Richards, Soddy and Hönigschmid, these conclusions have been definitely confirmed. The lowest value for uranium-lead is 206, and the highest for thorium-lead 207.7.

Since any admixture with ordinary lead tends to give a value nearer 207, these results may be considered as a definite proof of the nature and atomic weight of the end-products. In minerals containing both uranium and thorium the atomic weight of the mixture of the isotopes will depend on the relative amounts of these two elements and their relative rates of transformation. In unaltered minerals the determination of the amount of lead coupled with its average atomic weight allows us to determine the amount of uranium-lead even if some ordinary lead be present. In this way it should be possible to make a reliable estimate of the age of selected minerals and thus indirectly the age of the geologic strata. The amount of helium in the mineral gives a minimum estimate of its age, for, except in the most compact minerals, some of the helium must undoubtedly escape.

*Nature and Properties of the  $\alpha$  Rays (re-stated).*—Although the  $\alpha$  rays from active substances are of small penetrating power compared with the  $\beta$  or  $\gamma$  rays, they are responsible for most of the energy evolved by radioactive substances and contribute most of the ionization. Rutherford showed in 1903 that the  $\alpha$  rays were deflected in a powerful magnetic and electric field and consisted of positively charged particles projected with high velocity. From the first it seemed probable that the  $\alpha$  particle was an atom of helium and this was subsequently confirmed in a number of ways. The value of  $e/m$ —the ratio of the charge on the particle to its mass—and the velocity can be determined from observations on the deflection of the pencil of rays by a magnetic field and electric fields. In this way Rutherford and Robinson showed that the  $\alpha$  particle, whether from the radium emanation, radium A or C, gave a value of  $e/m = 4820$  e.m. units, while the electrochemical value of  $e/m = 4826$ , assuming that the mass of the helium atom is 4.00 and that it carries two unit positive charges. The magnitude of the charge carried by each particle was measured by Regener and Rutherford and Geiger and found to be twice that carried by the electron. The velocity of the  $\alpha$  particles expelled from radium C (of range 7.06 cms.) was found to be  $1.92 \times 10^9$  cm. per second, or about  $1/15$  the velocity of light. From this result the velocity of expulsion of all  $\alpha$  particles can be calculated from the relation found by Geiger, that  $V^2 = KR$  where  $V$  is the velocity of the particle and  $R$  its range in air. The evidence indicates that the  $\alpha$  particles from active products are in all cases atoms of helium. The  $\alpha$  particles from a given product are all emitted with constant velocity which is characteristic for that product. We have already mentioned that the velocity of expulsion appears to be connected with the period of transformation of the element. The laws of absorption of the  $\alpha$  particle were first worked out by Bragg and Kleeman. On account of their great energy of motion, the  $\alpha$  particle travels in nearly a straight line through the gas, producing intense ionization along its track. The effects produced by the  $\alpha$  particle, whether measured by ionization, phosphorescence or photographic action, vanish suddenly after the  $\alpha$  particle has traversed a definite amount of matter. This definiteness of the end of the range of the  $\alpha$  particle of given velocity is remarkable. The range of the  $\alpha$  particle is usually expressed in terms of cms. of air traversed at  $15^\circ$  C. and 760 mm. pressure.

On account of its great energy of motion the effect due to a single  $\alpha$  particle can be detected in a variety of ways. Sir William Crookes

first noted that the  $\alpha$  rays produce scintillations when they fall on a screen of phosphorescent zinc sulphide. It is now known that each of these scintillations is due to the impact of a single  $\alpha$  particle. The number of scintillations can be counted with the aid of a suitable microscope, and this method has proved of great utility in many investigations. Scintillations due to  $\alpha$  rays are observed in certain diamonds, but they are usually not so bright as in zinc sulphide. Kinoshita has shown that a single  $\alpha$  particle produces a detectable effect on a photographic plate. When the  $\alpha$  rays fall on a plate nearly horizontally the track of the  $\alpha$  particle is clearly visible under a high-power microscope. By the expansion method developed by C. T. R. Wilson, the track of the  $\alpha$  particle through the gas is made visible by the condensation of the water on each of the ions produced. In a similar way the track of a  $\beta$  particle can be easily shown. The photographs of these trails bring out in a striking and concrete way not only the individual existence of  $\alpha$  and  $\beta$  particles, but the main effects produced in their passage through matter.

*Properties of  $\beta$  and  $\gamma$  Rays (re-stated).*—We have seen that the  $\beta$  particles, which are emitted by a number of radioactive products, consist of swift negative electrons spontaneously liberated during the transformation of active matter. The velocity of expulsion and the penetrating power of  $\beta$  rays vary widely for different products. For example, the rays from radium B are much more easily absorbed by matter than the swift  $\beta$  rays from radium C. Moseley showed that in the case of these two products each disintegrating atom gave rise on the average to one  $\beta$  particle.

There is undoubtedly a close connexion between  $\beta$  and  $\gamma$  rays, and swift  $\beta$  rays are usually accompanied by penetrating  $\gamma$  rays. For example, radium C, which emits very swift  $\beta$  rays, some of which reach a velocity more than 0.08 of the velocity of light, gives rise to the most penetrating  $\gamma$  rays observed in the uranium-radium series. There is one very notable exception, viz. radium E, which emits swift  $\beta$  particles but weak  $\gamma$  rays. Gray has shown that  $\beta$  rays in passing through matter give rise to  $\gamma$  rays, and that these in some cases correspond to the characteristic X-radiations observed by Barkla. The absorption of the  $\gamma$  rays has been determined by the electrical method. Radium B has been found to emit several groups of  $\gamma$  rays which differ widely in penetrating power. The greater part of the rays from radium C consist of penetrating  $\gamma$  rays which are exponentially absorbed by matter. The ionization in an electroscope falls off according to the equation  $1/I = e^{-\mu d}$  where  $d$  is the thickness of matter traversed and  $\mu$  the coefficient of absorption. When lead is used as an absorbing material the value of  $\mu = 0.5$  for the most penetrating  $\gamma$  rays from radium C. The absorption coefficient for different kinds of matter is roughly proportional to the density, indicating that the absorption depends only on the mass of matter traversed.

The general evidence indicates that the  $\gamma$  rays consist of types of characteristic radiations which are excited by the passage of the  $\beta$  rays through the electronic system of the atom, but the  $\gamma$  rays from radium C are far more penetrating than any type of characteristic radiation observed in X rays generated in a vacuum tube.

Rutherford and Andrade have determined the spectrum of the  $\gamma$  rays from radium B and C by reflection from rock-salt. The most intense lines due to radium B are identical in wave-length with the X-ray spectrum of lead. This is to be expected, since radium B is an isotope of lead. The lines due to the "K" characteristic radiation are also observed. General considerations, however, indicate that the wave-length of the most penetrating  $\gamma$  rays is much too short to resolve or detect by the crystal method. In order to excite such rays in an X-ray tube potential differences of the order of two million volts will be necessary.

When the  $\gamma$  rays from a product like radium B or radium C are bent by a magnetic field and fall on a photographic plate, a kind of magnetic spectrum is obtained. Superimposed on the continuous spectrum due to particles of all velocities (between certain limits) certain sharp lines are observed, each of which represents a definite group of  $\beta$  rays which are emitted at the same speed. The velocity corresponding to each line in the spectrum has been determined for a number of  $\beta$ -ray products by Hahn and Miss Meitner. The magnetic spectrum of radium B and radium C was examined in detail by Rutherford and Robinson and more than 50 lines were observed, representing  $\beta$  particles projected over a wide range of velocity. The appearance of these lines in the spectrum appears to be connected with the emission of  $\gamma$  rays and is believed to be due to the conversion of the energy of the  $\gamma$  ray of definite frequency into the energy of an electron according to the quantum relation. When a thin layer of absorbing material is placed over the source, the primary  $\beta$  rays diminish in velocity and the lines become broad and diffuse. At the same time, however, new groups of  $\beta$  rays are formed by the conversion of  $\gamma$  rays into  $\beta$  rays in passing through the absorbing material, and these give well-marked bands on the photographic plate, occupying very nearly the same position as those due to the primary  $\beta$  rays before absorption. Results of this kind have an important bearing on the general problem of radiation, and give us indications of the facts to be accounted for in dealing with the conversion of swift  $\beta$  rays into  $\gamma$  rays of high frequency, and vice versa.

**Production of Helium.**—It was stated in the earlier article that, since the particle is an atom of helium, all radioactive matter which emits  $\alpha$  particles must produce helium. This has been found to be the case for every  $\alpha$ -ray product that has been examined. The rate of production of helium by radium in equilibrium has been measured with accuracy by Dewar, Boltwood and Rutherford. In terms of the International Radium Standard, the rate of production of helium by one gram of radium in equilibrium with its three  $\alpha$ -ray products has been found to be 164 cub. mm. per year. This value is in excellent accord with that calculated from the rate of emission of  $\alpha$  particles, viz. 163 cub. millimetres. The rate of production of helium by the radium emanation, ionium and polonium has been found by Boltwood to be in fair agreement with calculation. Soddy has observed the production of helium by purified uranium, while Strutt showed that the rate of production of helium in uranium and thorium minerals accorded with calculation.

Strutt has made a systematic examination of the amount of helium present in many minerals and rocks which contain minute quantities of radium and has utilized the results to estimate the age of the geological deposits. On account of the tendency of the helium to escape from minerals in the course of geologic ages, this method gives only a minimum estimate of the age of the mineral, except in the case of very dense and compact specimens. The measurement of the lead content should ultimately prove a more reliable method of estimating the age.

**Heat Emission of Radioactive Matter.**—As was stated earlier, there is no doubt that the evolution of heat by radium and other radioactive matter is mainly a secondary phenomenon, resulting mainly from the energy of the absorbed radiation. Since the particles have a large kinetic energy and are easily absorbed by matter, all of these particles are stopped by the radium itself or by the envelope surrounding it and their energy of motion is transformed into heat. The evolution of heat from any type of radioactive matter is thus proportional to the energy of the expelled  $\alpha$  particles, together with the energy of the  $\beta$  and  $\gamma$  rays absorbed in the envelope. The energy supplied by the recoil of the radioactive atom after the expulsion of an  $\alpha$  particle is about 2% of the energy of the  $\alpha$  particle.

These conclusions have been confirmed by the measurements of Rutherford and Robinson, who found that each of the  $\alpha$ -ray products gave a heating effect proportional to the energy of the  $\alpha$  particle and absorbed  $\beta$  and  $\gamma$  rays. The emanation and its products when removed from radium were responsible for three-quarters of the heating effect of radium in equilibrium. The heating effect of the radium emanation, radium A and radium C decayed at the same rate as their activity. From their measurements they found that the total heating effect of radium in equilibrium surrounded by sufficient material to absorb the  $\alpha$  rays was 134.7 gram-calories per hour per gram. Of this, 123.6 gram-calories were due to the  $\alpha$  particles, 4.7 to the  $\beta$  rays and 6.4 to the  $\gamma$  rays. The energy of the  $\beta$  and  $\gamma$  rays comes from radium B and radium C, but on account of their great penetrating power it is difficult to measure the  $\beta$  energy with accuracy. The results, however, show that the energy of the  $\gamma$  rays is even greater than that of the  $\beta$  rays, and the two together are equal to about 28% of the energy of the  $\alpha$  particles from radium C. Measurements have been made of the heating effect of radium, uranium and thorium and of uranium and thorium minerals. In each case the evolution of heat is of about the magnitude to be expected from the energy of the radiations.

**Radioactivity of Ordinary Matter.**—Apart from the well-known radioactive elements of high atomic weight, only two other elements have been shown to exhibit the property of radioactivity to a detectable degree, viz. potassium and rubidium. Campbell showed that these elements emit only  $\beta$  rays and in amount small compared with uranium. This property appears to be atomic, but no evidence has been obtained of any subsequent changes. If the  $\beta$  particle comes from the nucleus of the atom, potassium should be transformed into an isotope of calcium, and rubidium into an isotope of strontium.

Radium and thorium have been found to be distributed, but in very minute amount, in the surface rocks and soil of the earth. The emanation from the soil diffuses into the atmosphere and causes a small ionization which can be readily measured. A penetrating  $\gamma$  radiation, no doubt due to the presence of radium

and thorium in the earth's crust, has been observed near the earth's surface, but becomes very small over a lake or the sea.

Schweidler, *Radioaktivität* (1916); F. Soddy, *Chemistry of the Radioelements*, parts I. and II. (1914-5); see also under "Radioactivity" in annual *Reports of the Chemical Society*. (E. Ru.)

**RADIOTHERAPY.**—Since 1910 there have been notable developments, extending the practice of X-ray treatment (see 28.887) into the wider field now included in radiotherapy, a term which had not then come into general use. Strictly speaking, under this term should be included treatment by all kinds of rays; thus treatment by heat, by sun's rays, by ultra-violet rays, by X-rays and by the rays of radio-active substances, all come under the etymological term of radiotherapy. In practice, however, it is restricted to the application of ultra-violet rays, X-rays and radium rays. Amongst radiologists, the term has undergone an even sharper definition, so that radiotherapy is applied by them to treatment with X-rays alone, the terms radiumtherapy (or, in France *curietherapy*, in honour of the discoverer of radium) being applied to treatment with the rays of radium and other radio-active substances. Treatment by means of high frequency currents and diathermy are included rather under the term electrotherapy.

**Ultra-violet Rays.**—These rays to a large extent are the essential feature of those forms of medical treatment which depend upon exposure to sunlight (heliotherapy). Probably this is not the whole story. Even though heat rays may also play some part, experience of the treatment of wounds by sunlight in France during the World War indicated that a degree of benefit arises from exposure to sunlight which cannot be entirely attributable to warmth and ultra-violet rays. On the other hand, in the Finsen light treatment of lupus and in the treatment of tuberculosis at high altitudes, ultra-violet rays probably play a predominant part. It is uncertain how these rays act; they penetrate but a fraction of a millimetre into the epithelium and yet the fact that in tropical countries where sunlight is great, the white races show a proverbial irritability which does not characterize the pigmented native races, suggests that in the one, effects are produced by the ultra-violet rays which the pigment of the other is able to eliminate. Certain it is that under ultra-violet light, persons vary in the appearances they present, those who freckle or tan easily when exposed to sunlight showing the potential freckles or bronzing of their skin by dark marks which are absent from the skins of those who do not freckle or tan easily. In this connexion, it is noteworthy that those tuberculous persons are said to derive greater benefit from a sojourn at high altitudes who normally tan easily under sunlight, than those who do not. The rays are bactericidal, but whether part of their action lies in this direction, is unknown.

**X-rays.**—The X-rays which were discovered by Röntgen in 1895 are employed in medicine in two ways, firstly, as an aid to diagnosis when they form those branches of the subject known as radiology and radiography, and secondly, for the actual treatment of conditions when diagnosed. Thus by means of radioscopic or radiographic examination it may be found that there is a tumour in the chest, and as a result of that diagnosis it may be decided to institute treatment (radiotherapy) by means of X-rays or radium rays or the two combined.

X-radiation has the advantage that considerable doses can be employed. It has the disadvantage that the X-rays are frequently not of sufficiently penetrating power to serve for the treatment of tumours deep within the body. Three varieties of X-rays are used, the difference consisting in variations in wave lengths and in penetrating power. These varieties are known clinically as "soft," "medium" and "hard" X-rays, the soft rays being those of longer wave length and less penetrating power, and the hard rays being those of shorter wave length and greater penetrating power. The softest X-rays are not used clinically; those employed in the treatment of ringworm for example are "medium soft" since it is necessary for penetration to reach as deeply as the hair follicles. Medium

hard and hard X-rays are used where a layer or mass of tissue some little distance beneath the surface is to be treated.

For the better treatment of new growths removed some distance from the surface of the body, there is a tendency at the present time (1921) to increase the hardness of the rays to the utmost extent with the object of producing a radiation that approximates in some degree to the gamma rays of radium in penetrating power. Chief amongst the new growths that are the subject of this "deep therapy" with intensely penetrating X-rays are uterine fibroids. The production of soft to medium X-rays requires an apparatus capable of generating about 100,000 volts, for deep therapy a voltage of about 200,000 is necessary and the aim of radiologists is to get a still higher voltage. The method employed is essentially use of a series of transformers.

It is unnecessary here to enter into a detailed examination of the methods whereby X-ray dosage is determined, but it is obvious that estimation of the dose is one of the most important points in connexion with radiotherapy. In the case of radium, the matter is relatively simple, for the output of rays from the radium is constant, but in the case of the X-ray bulb, quite apart from variations in the primary current, the conditions of the bulb vary within wide limits, and the output of the bulb in X-rays varies accordingly. An important advance has been made in recent years by the introduction of the Coolidge tube in which by means of a different working principle the output of X-rays can be kept fairly steady. Under all circumstances, the output of an X-ray bulb is heterogeneous, the bundle of rays emitted is partly penetrating, partly soft, and in order to produce a more or less homogeneous bundle of rays for purposes of treatment, it is necessary to eliminate the softer varieties by means of filters. These filters are of different kinds but the chief are aluminium, zinc, copper and lead. For absorption of the specific secondary radiations produced when gamma or X-rays impinge upon metals, such substances as rubber, gauze, cardboard are used.

When a more or less homogeneous beam has been produced, it is necessary to calculate the dose employed in any given case for comparison with other cases. Various means have been adopted to this end, of which the commonest is the Sabouraud's pastille which consists of barium platinum cyanide and changes colour from green to yellow under a certain dosage of the rays. It was thought at first that this colorimetric test would be generally applicable, but it was soon found that the change is not brought out by X-rays of all degrees of penetration and is fallacious as a guide to gamma radiation of radium. It is now largely employed as a test of dosage during the X-ray treatment of ringworm and other skin diseases, but it is recognized that it must only be employed with caution, with rays of medium hardness, and for superficial conditions. Another form of test is electrical (ionto quantimeter) in which the rate of discharge of a charged gold leaf forms a measure of the output of X-rays. Another method depends upon the chemical reduction of iodine from iodoform in a chloroform solution and is probably the most scientifically accurate of all the methods which have been devised. Yet other methods depend upon the correlation between the effects produced by X-rays on the one hand and the gamma rays of radium on the other. Here the production of identical degrees of fluorescence on the fluorescent screen or of silver deposit on the photographic plate or of biological effects on the animal cell has been aimed at in standardization.

So far as treatment is concerned, it is obvious that a biological test is the most satisfactory. The one commonly used is known as the "erythema dose," meaning thereby that dose of X-rays which leads to a reddening of the skin a few days after application and subsequently to slight bronzing, without blistering or other damage. On the other hand there is no doubt that the various cells of the body do not react to radiations in the same degree and partly on this account and partly because of the operation of the law of inverse squares, it is obvious that the skin over a tissue being irradiated may itself receive an injurious dose while the tissue in question is receiving the correct dose. Hence when a tissue some distance beneath the surface is under

treatment it becomes necessary to irradiate it through different portals, so that each area of skin shall receive less than the erythema dose, although the tissue in question gets the full amount that the radiologist wishes to give it; this method of cross fire is largely employed.

**Radio-active Substances.**—Treatment by means of radio-active substances largely resolves itself into treatment by means of the beta and the gamma rays of radium or occasionally mesothorium. Just as X-rays vary in degree of penetration, so do the rays of radium. The so-called alpha rays are little penetrating, being stopped by about  $\frac{3}{8}$  cm. of air. The beta rays, which are particulate negative electrons, are more penetrating but their penetrating power varies over a wide field, some of the softest being as easily absorbed as alpha rays, some of the hardest approximating to the soft gamma rays in penetrating power. Gamma rays are aether vibrations and they, too, vary in degree of penetrating power. Their wave length is the shortest of any form of vibration known, and the most penetrating gamma rays can be detected through several inches of lead.

The alpha rays are but little used, the only methods of employment being in the way of radium emanation dissolved in saline solution, or of needles upon which "active deposit" from radium emanation has been collected. In either case the emanation water or the active deposit needles must be introduced into the system—whether intravenously or into the solid tissues—otherwise the alpha rays would have no power to act. In either case, too, they act along with the beta and gamma rays produced by the active deposit.

Beta radiation is always used in conjunction with gamma radiation, but inasmuch as the ionizing power of the beta ray is about 50 times as great as that of the gamma ray, it follows that when beta radiation is being employed, the gamma radiation may probably be ignored. Beta radiation is used for merely superficial conditions and the radium salt which supplies it is spread over a flat or curved applicator and is covered with a thin layer of varnish, mica or aluminium or is placed in a thin glass tube; the beta rays which traverse thin solid filters act upon the tissue in the neighbourhood of which the radium is placed. Instead of a radium salt one of its products, viz. radium emanation, is often employed clinically. No essential difference is introduced by the use of this emanation excepting that its intensity undergoes a progressive diminution with time since it falls to half value in 3.85 days. Early rodent-cancer, certain conditions of the eyelids, some cutaneous non-malignant tumours and birth-marks, are treated successfully in this way.

Gamma radiations are used where deep penetration is required, but the law of inverse squares approximately holds good in their case also, a matter of fundamental importance in treatment. The substances used as filters when radio-active materials are employed in treatment are not quite the same as those used along with X-rays. Since one of the main objects in employing radium is to utilize the highly penetrating gamma rays, the filters employed are generally of the higher atomic weights, silver, brass, gold, lead, platinum, and there is some reason for believing that the more highly penetrating the rays, (i.e. the denser the filter through which they have passed) the less is undesirable damage suffered by the tissues.

**Mode of Action of Radiations.**—The method by which X-rays and radium rays produce their effects are not thoroughly understood, but it is certain that dosage must vary according to the type of cell which it is desired to influence. Thus the vulnerability of skin is not the same in different individuals nor even in different regions in the same individual; the vulnerability of the squamous cell is not the same as that of the columnar cell; the vulnerability of renal cells differs in the convoluted tubules and in the conducting tubules. Even in the fur of animals it is possible to recognize a differentiation, for a certain amount of X-radiation will lead to a destruction of the pigment forming cells in the hair of a black rat, while a little more radiation will affect the cells themselves. In the former case there is no epilation but the hair comes white instead of black, in the latter the hair falls out and baldness results.

If the question be carried still further back and the behaviour of the cells themselves under radiation be considered, it has been found that the rays may act principally, though not exclusively, upon the nucleus or upon the cytoplasm or upon the cell membrane or upon any paraplasmic material within the cell. The greater amount of work in this direction has been carried out with radium but there is little doubt that the effects of X-rays are similar. In part, changes are produced owing to the fact that the radiations break down complex chemical substances into simpler constituents. In this way, the osmotic tension of the cell or nucleus affected is raised and a dropsical condition results which can often be recognized microscopically. Other forms of degenerative change produced are fatty and mucoid. Thus radiation, if in great doses, will lead to fatty change in voluntary muscle of man and most animals or in renal cells of the cat. Under large doses of radium, mucoid changes are excessively common in all parts which normally produce mucus, but in addition, there is a great tendency for cells which ordinarily do not form mucus to undergo mucoid degeneration. Sometimes the cytoplasm of the cells disappears, though not obviously by way of either of these changes, with the result that the nucleus lies naked in the middle of the cell and separated from the cell membrane by a considerable distance. So far as the nucleus is concerned, changes produced by radiations may be intense. In cells such as those of testicle or intestine which are often found in mitotic division, mitosis is arrested or abolished. In other nuclei there may be evidence of vacuolation or the nucleus may be converted into a mere empty sac, or the nuclear membrane may disappear, or the entire nucleus may be represented by a few points of stained material or, finally, the nucleus may disappear altogether.

Thus in one or other way, changes are produced as the result of irradiation in the tissues upon which those rays impinge and the effects produced will depend upon (1) the type of cells affected, (2) the quantity of rays employed, (3) the length of time those rays have acted.

It must be remembered that the biological cell usually acts in one or other of two opposite directions when exposed to a physical agent according to the intensity with which the agent acts. Thus we distinguish between a stimulating or beneficial effect and an irritative or injurious effect. There is reason to believe that both of these may follow upon irradiation. In the case of malignant new growths, there is no doubt that death and destruction of the neoplastic cells occur where the rays act in all their intensity, but there is equally no doubt that because of the law of inverse squares and the specific absorption by the tissues a point is reached at which the injurious effect on the malignant cells which we desire passes into a stimulant effect which we may have reason to deplore. If this stimulus act on young and actively growing malignant cells at the periphery of the growth our irradiation will do more harm than good to the patient. There can be little doubt that in the early days of radiotherapy, some cases of malignant disease ran a more rapid course as the result of the irradiation treatment than otherwise they would have done. For this reason, the essential point of their treatment by means of radium consists in an endeavour to deal with the peripheral neoplastic cells.

On the other hand, changes may be produced in cells which we are unable to recognize microscopically. Recently the treatment of exophthalmic goitre has been largely and for the most part, successfully, carried out by irradiation and yet if the thyroid body be examined from animals exposed for many hours to the gamma radiations of radium bromide, it may be doubtful whether histological changes can be detected. Similarly, intense gamma radiation of the male frog produces no testicular changes that can be detected with certainty, and yet far less radiation produces marked changes in the tadpoles derived from normal ova fertilized by such radiated spermatozoa.

It follows from what has been said above, that radiotherapy is not without its special dangers. Amongst the disadvantages to which the irradiations may give rise, too extensive destruction of tissue on the one hand or stimulation of new growth on

the other are relatively obvious but the dangers are more insidious. Recent work has shown that long continued exposure to minute doses of radiation (in addition to the well-known occasional production of skin cancer) leads to blood changes which in course of time become a pronounced menace to life. Not only are red and white blood cells destroyed, but the rays appear to exert a deleterious effect upon the blood-forming tissues with the result that an aplastic anaemia becomes established. Obviously, the protection of the personnel in hospitals and similar institutions where X-rays and radium are used becomes a matter of great importance.

It is probable that X-rays and radium will always continue to be employed side by side owing to the special advantage which each form of radiation possesses, and in some cases it is certain that the best results are obtained in combination.

It will have appeared from what has been said above that radiotherapy is largely—though by no means exclusively—concerned with the treatment of new growths. Irradiation by one or other method is used in cases of uterine fibroid and in cases of inoperable cancer, sometimes with astonishingly good results. It is also used in conjunction with operation for cancer with the object of warding off recurrences. Sometimes cancers, inoperable when they first come under observation, are rendered operable by treatment with radium. And, frequently, when surgery has done all that is possible a considerable degree of relief is given by irradiation.

In addition to their use in the treatment of new growths, X-rays and radium have been tried in most of the chronic forms of disease. When surgery or medicine fails to relieve a case, it is usual to try irradiation. Sometimes the results are surprisingly beneficial, but the limits of utility of the rays still need to be determined. (W. S. L-B.)

**RAEMAKERS, LOUIS** (1869– ), Dutch cartoonist, was born at Roermond, Holland, April 6 1869. He received his education in art at various schools, and finally at Amsterdam, where he obtained several prizes. He subsequently became director of an art school at Wageningen, in Gelderland. About 1908 he started drawing political cartoons, but it was not until the outbreak of war in 1914 that his work attained world-wide reputation, by his anti-German cartoons, illustrative of the devastation of Belgium and Northern France. Many special exhibitions of his war cartoons were held, and his work had a great effect as propaganda. Several volumes of his work have been published: *The Great War in 1916*; *The Great War in 1917*; *Devant l'Histoire* (1918); *Cartoon History of the War* (1919).

**RAILWAYS** (see 22.819; also **LIGHT RAILWAYS, MILITARY**).—**UNITED KINGDOM**.—In 1910 British railways had reached a high standard of completeness and development, and, although a number of new lines were subsequently brought into use, two only are of primary importance in regard to through main-line traffic. One of these is the first section of the Enfield-Stevenage line of the Great Northern railway, opened for traffic as far as Cuffley on April 4 1910. On the same date the Ashenden-Aynho line of the Great Western railway was brought into use for goods traffic. The former was part of a new line designed to afford an alternative route into London avoiding duplication of the Welwyn Viaduct and, by adopting a new route, opening up a new district near London for suburban development. From 1916 onwards the northern portion was laid with a single line and used for goods traffic, and towards the end of 1920 a second track was laid. In June 1921 this section had not yet been opened for passenger traffic, but was already being largely used for goods and mineral trains. The Ashenden-Aynho line was, however, on July 1 1910, brought into regular use as part of a shortened main route between London and Birmingham, and a two-hourly schedule then came into force for the principal Great Western expresses.

Among other important new lines brought into use the following may be mentioned: June 1 1910, Filton Junction and Avonmouth Docks, and the Camerton and Limpley Stoke lines, G.W.R.; Armagh, Keady & Castleblaney railway, worked by G.N.R. (I.), completed December 1 1910; April 13 1911, Shropshire & Montgomeryshire light railway; May 12 1911, Lampeter and Aberayron

line, G.W.R.; May 1 1912, Goole and Selby line, N.E.R.; June 3 1912, Dearne Valley railway (worked by L. & N.W.R.); June 16 1913, Mansfield railway opened for goods traffic, and on April 2 1917 for passenger traffic (worked by G.C.R.); and July 1 1913, Kirkstead and Little Steeping Line, G.N.R. On July 1 1912 the London & North-Western railway brought into use a part of the "Watford new lines," and the branch to Croxley Green, the remainder being opened on Feb. 17 1913. On June 2 1913 the Great Western railway opened part of the remarkable series of lines designed to improve railway communication in South Wales and referred to generally as the Swansea District lines. Other sections were added at various later dates. On Sept. 26 1915 the North British railway brought into use a series of new lines in the Edinburgh district, designed mainly to facilitate mineral traffic working known as the New Lothian lines. On May 22 1916 the Great Central railway opened the Keadby deviation line, including a new bridge over the Trent with a Scherzer rolling-lift bridge of 200 ft. span. In July 1915 a section of the old Ravenglass and Eskdale railway in Cumberland was reopened on the 15-inch gauge, using locomotives of model or "exhibition" types, but catering to public passenger and goods traffic. Extensive reconstruction works at Waterloo, L. & S.W.R., were nearing completion in 1921.

**Electric Railway Extensions and New Lines.**—On July 27 1912 the Central London railway was extended to Liverpool Street. On December 1 1913 the "Bakerloo" section of the London Electric railway was extended to Paddington, and on February 11 1915 to Queen's Park, there connecting with the L. & N.W.R. On April 6 1914 the loop under the river at Charing Cross on the "Hampstead" section of the London Electric railway was brought into use. On May 31 1915 the four-track section, from Finchley Road to Harrow, of the Metropolitan railway was completed over Kilburn Viaduct. On Aug. 3 1920 the Ealing and Shepherd's Bush railway, connecting the Central London railway at Wood Lane with the G.W.R. at Ealing Broadway, was completed and opened for traffic.

**Railway Electrification** (see also ELECTRICAL ENGINEERING).—Equipment of existing railways for electric working has been considerably extended. On May 12 1911 the L.B. & S.C.R. commenced to work electric trains between Victoria and the Crystal Palace. On March 1 1912 the London Bridge routes via Tulse Hill were added, the complete electric service becoming operative on June 1 1912. Since that date equipment of various other routes has been in hand but owing to interruption of the war no further sections are yet electrically operated. On the London & South-Western railway electric traction was inaugurated between Waterloo and Wimbledon, *via* East Putney, on Oct. 25 1915; on the Kingston "Roundabout" route Jan. 30 1916; on the Hounslow loop March 12 1916; to Hampton Court June 15 1916; and to Claygate Nov. 20 1916. Electric working on the North London and L. & N.W. railways was commenced between Willesden Junction and Earl's Court on May 1 1914, and between Broad Street and Richmond and Kew Bridge on Oct. 1 1916. On May 10 1915 the London Electric railway commenced to work through to Willesden Junction *via* Queen's Park, and from April 18 1917 this service was continued to Watford over the "Watford New Lines," though it was not until 1920 that the L. & N.W.R. was able to take its share in the working of this service, as the specially constructed joint rolling stock began to be delivered after the war from the makers. During 1919 L. & N.W.R. electric trains began to work from Broad Street to Watford *via* Hampstead Heath. Work was in 1921 well advanced upon the new "tube" tunnel under Primrose Hill and the entire reconstruction of L. & N.W.R. lines at Chalk Farm to enable "flying" or "burrowing" connexions to be made between the Euston and Broad Street routes and between the three sets of running lines, but electric operation could not be inaugurated *via* Chalk Farm and from Euston until this was sufficiently completed. On March 31 1912 Metropolitan railway electric trains commenced to work over the East London railway between Shoreditch and the two New Cross stations, with through trains, *via* Aldgate East, to and from Hammersmith. Principal developments in regard to electric traction in the provinces are the electrification in 1916 of the Newport-Shildon section of the North-Eastern railway to enable heavy mineral traffic to be operated by electric instead of steam locomotives, and of the L. & Y.R. route from Manchester (Victoria) to Bury, *via* Prestwich, in Feb. 1916, following the experimental high-tension electrification between Bury and Holcombe Brook which had been used from July 1913.

Mention may also be made of the installation in 1911 of escalators at Earl's Court, connecting the "Piccadilly" section of the London Electric railway with the Metropolitan District station above. Escalators were also provided at Liverpool Street on the opening of the Central London railway extension in July 1912, since which date these have been systematically adopted at all new tube railway stations. They have also been introduced at several existing stations, as at Oxford Circus, London Electric railway, and on the L. & S.W.R. at Waterloo to connect the Waterloo and City station with the terminus above.

**Dock Improvements.**—Principal developments in regard to dock and similar facilities affecting railways are the opening of Immingham Dock, G.C.R. (by the King and Queen) on July 22 1912; of the new Methil Docks, N.B.R., on Jan. 22 1913; of the King George Dock at Hull, H. & B. and N.E. railways (by the King and Queen)

on June 26 1914; and the opening of a new lock entrance, designed to enable the largest vessels to enter at all states of the tide, at Newport, Alexandra Docks & Railway, on July 14 1914.

**New Locomotive Works.**—During 1910 and 1911 the new locomotive works at Eastleigh of the L. & S.W.R. were brought into use, and the old works at Nine Elms dismantled and the area thus cleared handed over to the Goods Department. The Great Eastern railway added several new workshops to the rolling-stock plant at Stratford in 1914-6.

**Signalling.**—Automatic and power signalling had already become well established in 1910, but only a limited amount of further development can be recorded. In Jan. 1911 two-position upper-quadrant electric signals were introduced on the Metropolitan railway, and have since been adopted where semaphores are retained on the "Underground" sections. On the Keadby deviation line of the G.C.R., already mentioned, three-position upper-quadrant signals have been in use since May 1916, while the Ealing & Shepherd's Bush railway is the first line in the United Kingdom to be opened with all signals of this type. In Jan. 1920 a complete power signalling installation on three-position upper-quadrant principles was brought into use at Victoria, S.E. & C.R.

**Express-Train Running.**—During the years 1910-4 express passenger-train facilities reached their highest level, and the time-tables arranged for the summer of 1914 showed the following numbers of non-stop runs of 100 m. or more: *Caledonian railway* 10 runs, the three longest being between Carlisle and Perth, 150½ m.; *Great Eastern railway* 7 runs, the two longest being of 131 m. between Liverpool Street and North Walsham; *Great Northern railway* 29 runs, the longest being from Wakefield to King's Cross, 175½ m.; *Great Central railway* 6 runs, the longest being from London to Sheffield, 164½ m.; *Great Western railway* 40 runs, the longest from Paddington to Plymouth (North Road), 225½ m.; *London & South-Western railway* 4 runs, three of which were operated between Waterloo and Bournemouth (Central), 108 m.; *London & North-Western railway* 74 runs, the longest being between Euston and Rhyl, 209½ m.; *Midland railway* 25 runs, the longest from St. Pancras to Shipley (a stop to change engines only, not advertised) 206 m.; *North-Eastern railway* 14 runs, all between Newcastle and Edinburgh, working through over N.B.R. north of Berwick, 124½ m. Average speeds for the best of these runs were respectively: C.R. 49·7; G.E.R. 49·7; G.N.R. 57; G.C.R. 55·85; G.W.R. 54·8; L. & S.W.R. 54; L. & N.W.R. 52·7; M.R. 50·86; and N.E.R. 54·1 m.p.h. On several of these lines, however, trains making somewhat shorter runs provided even higher averages. The following non-stop runs exceeding 55 m.p.h. may be noted:—

		Miles	Minutes	Average
N.E.R.	Darlington to York	44½	43	61·7
G.C.R.	Leicester to Arkwright St., Nottingham	22½	22	61·3
L. & S.W.R.	Dorchester to Wareham	15	15	60
G.W.R.	Paddington to Bristol	118½	120	59·2
L. & N.W.R.	Willesden to Coventry	88½	92	57·7
G.N.R.	Grantham to King's Cross	105½	110	57·5
C.R.	Forfar to Perth	32½	34	57·2
M.R.	St. Pancras to Kettering	72	76	56·8
G.E.R.	Halesworth to Woodbridge	21½	23	56·6
C.L.C.	Manchester to West Derby	31½	34	55·1

It may be remarked that the short L. & S.W.R. run mentioned was due to an error in time-table compilation, but was worked for some time. The S.E. & C.R., L. & Y.R., and G. & S.W.R. had runs exceeding 54 m.p.h., while the Great Southern & Western and the Great Northern railways in Ireland, the H. & B. & S.C.R., the London, Tilbury & Southend section of the Midland railway, and the Hull & Barnsley railway also had runs averaging 50 m.p.h. or over.

Many of the runs mentioned had been operated for several years before the outbreak of war in 1914, but in two cases at least, the highest level was reached between 1910 and 1914. Thus, on the Great Western railway, the opening of the Ashenden-Aynho line, shortening the distance between London and Birmingham to 110½ m., provided four down non-stop trains in the even two hours. These conveyed from one to three slip coaches, detached at Banbury, Leamington or Knowle, but the over-all time of two hours was also given to several up trains, though these had to include stops at Leamington or Banbury or both. On the London & North-Western railway a number of London-Birmingham trains were similarly accelerated to 120 minutes for the distance of 113 miles. On the London & South-Western railway two hours became the standard for Waterloo-Bournemouth non-stop trains as from July 3 1911.

**Train Service Developments.**—The following developments in train service facilities may be noted. On Feb. 1 1910 the L. & N.W.R. introduced "city-to-city" expresses between Wolverhampton and Birmingham and Broad Street. A novelty on these trains was the provision of a typewriting compartment, in charge of a qualified stenographer. In the following May similar arrangements were

introduced on certain Birmingham-Euston expresses. In July 1910 restaurant cars were introduced on through trains between Manchester, Birkenhead and Bournemouth, L. & N.W., G.W., and L. & S.W. railways. In July 1910 certain Midland Anglo-Scottish expresses were diverted to run over the L. & N.W.R. between Penrith and Carlisle. At the same time several Caledonian expresses to and from Aberdeen began to use Glasgow Central Station instead of Buchanan Street. In Oct. 1910 the G.W.R. introduced through trains via the Ashenden-Aynho line between Wolverhampton and Victoria, S.E. & C.R. In July 1910 the L. & S.W.R. improved their Southampton-Hayre route to the European Continent. In May 1911 the S.E. & C.R. Continental service from Queenborough to Flushing was transferred to Folkestone. On June 1 1911 tea cars were introduced on the afternoon expresses between London and Manchester and Liverpool, L. & N.W.R. From July 3 1911 through carriages forming parts of S.E. & C.R. Kent Coast and other expresses were run to and from King's Cross, G.N.R. On the same date the N.E.R. introduced hourly expresses between Newcastle, Sunderland, West Hartlepool, Stockton and Middlesbrough. In March 1910 Metropolitan District trains commenced to work through over the Metropolitan railway to Uxbridge, and in June of the same year through trains between Ealing and Southend were added. In July 1913 the G.W.R. introduced the "Devon and Cornwall Special" express (third class only) between London and the West of England.

**Pullman Cars.**—Hitherto used only on the L.B. & S.C.R., on March 21 1910 Pullman cars were added to certain S.E. & C.R. Continental expresses via Dover, and in the following December to those via Folkestone. In June 1910 they were adopted by the Metropolitan railway on the extension line to Aylesbury. In June 1914 Pullman cars were introduced on a considerable scale by the Caledonian railway, some of them replacing first- and second-class restaurant cars, while others were available only for first-class passengers on payment of a supplement as usual. In Sept. 1915 the L.B. & S.C.R. added third-class Pullman cars to certain trains. From June 16 1919 Pullman cars were added to Folkestone and Kent Coast expresses, S.E. & C.R. In July 1921 the S.E. & C.R. added a special Pullman express, the "Thanet Limited," between Victoria and Ramsgate Harbour on Sundays. From Nov. 11 1920 Pullman cars began to run on the G.E.R. Both first- and second-class cars now run on its Continental expresses, and first- and third-class cars on other routes.

**Withdrawal of Second-Class Accommodation.**—Several railways had already withdrawn second-class accommodation, partially or wholly, before 1910, but in Oct. of that year the G.W.R. discontinued provision for second-class passengers. From June 1 1911 the L.B. & S.C.R. adopted the same course; the L. & N.W.R., Cambrian, North Staffordshire, and Maryport & Carlisle from Jan. 1912, and from July 22 1918 the L. & S.W.R.

**Season Tickets.**—In regard to season tickets several interesting items may be referred to. In May 1910 the G.W.R. commenced to issue season tickets at stations on application. In Dec. of the same year the G.N.R. discontinued calling for deposits on season tickets, this practice being now general on most lines. From Jan. 1 1912 the Metropolitan railway issued "limited season tickets" to the wives of season-ticket holders, a corollary to the shopping tickets which had been issued from Jan. 1910, available only between 10 A.M. and 4 P.M., the first-class fares being little more than for third class.

**Working Arrangements.**—Several important working arrangements and agreements between leading railways were already in operation as between the L. & N.W., L. & Y. and Midland railways, and in May 1910 a similar working arrangement was entered into between the G.W. and L. & S.W. railways. In Aug. 1912 the London, Tilbury & Southend railway was taken over by the Midland company, being thereafter known as the L.T. & S. section. In Oct. of the same year the Great Northern & City railway was incorporated into the Metropolitan system, and in Nov. 1912 the City & South London and Central London railways were brought into the group controlled by the Underground Electric Railways Co. of London, Ltd. In Jan. 1915 a reorganization of the "Underground" companies, co-ordinating the several managements, was adopted. In April of the same year the Great Eastern railway adopted a reorganization of the chief departments, while the operating and commercial departments were separated as from July 1 1915.

**Strikes, etc.**—In Aug. 1911 there was a short strike of railwaymen which led to the appointment of a special Royal Commission. The principal result of this was the establishment of Conciliation Boards, including representatives of the respective managements, of the various grades of staff and of the Board of Trade, for the purpose of dealing with questions of pay, duties and other problems affecting railway staff. In Sept. 1911 there was a strike of Irish railwaymen. In March 1912 a coal-strike entailed many difficulties upon the railways, the Great Eastern being the only large company which was able to maintain approximately full train services throughout. In Dec. of the same year there was a strike on the North-Eastern railway owing to the suspension of a driver named Knox, for alleged drunkenness, but this did not spread to any serious extent. Knox was actually fined for being drunk by the Newcastle magistrates on Oct. 26. He was off duty at the time. But eventually an inquiry by Mr. Chester Jones, the London police-magistrate, resulted in his reporting (Dec. 14) that Knox (though "not quite sober") had not

been "drunk in the police-court sense," and he was then reinstated. In March 1913 the National Union of Railwaymen was formed from the Amalgamated Society of Railway Servants, the General Railway Workers' Union, and the United Signalmen's and Pointsmen's Society. In Oct. 1913 a Royal Commission on Railways began its sittings, which were not completed at the outbreak of the war.

**Railway (Accounts and Returns) Act 1911.**—Commencing Jan. 1 1913, the Railway (Accounts and Returns) Act 1911 came into force, from which date the methods of preparing the annual returns of all railway companies were unified and systematized, and the previous half-yearly periods, with their Scottish variations, gave place to accounts and returns for the calendar year, providing for annual meetings in Feb. in every case. The year 1913 is the only one for which complete accounts and returns were prepared in accordance with the Act, the conditions of railway control and guarantee during and subsequent to the war having prevented later returns being presented in complete form. Indeed, during the actual war period the accounts and returns were reduced to bare essentials, and some tables are still necessarily in abeyance.

**"Safety First."**—In 1914 the Great Western railway adopted systematic "Safety First" propaganda, immediately followed by the London "Underground" railways, and since that date the matter has been closely followed up by other companies, several having issued publications to their staff setting forth "Safety First" principles. On Dec. 1 1916 the London "Safety First" Council was constituted, including representatives of several railways.

**Locomotive Development.**—Superheating was already recognized as a desirable feature of locomotive practice in 1910, and has since become firmly established as an essential part of almost every locomotive design, including tank and shunting as well as main-line passenger and goods classes. The Schmidt and Robinson types are both widely employed, the former in the hands of the firm known as Marine & Locomotive Superheaters, Ltd., and the latter in those of the Superheater Corp., Ltd. Both have been developed, and dampers or draft retarders are now seldom employed, improved designs of release, snifting and other valves or adjuncts, or the use of a steam circulating system, being found to meet the needs of the situation. The designs mainly used in each case are the types A and B of the respective firms. Several other designs are, however, now in considerable use; Mr. G. J. Churchward's "Swindon" apparatus on the Great Western railway; Mr. G. Hughes's "top and bottom header" and "twin plug header" designs on the Lancashire & Yorkshire railway; Mr. R. W. Urie's "Eastleigh" superheater on the London & South-Western railway; Mr. H. N. Gresley's "twintube" superheater on the Great Northern railway; Mr. R. E. L. Maunsell's special form of header (M.L.S. superheater, Type C) on the South-Eastern & Chatham railway; and Mr. E. A. Watson's design on the Great Southern & Western railway of Ireland. Mr. J. G. Robinson, of course, uses the "Robinson" pattern on the Great Central railway and his designs are largely used also on other railways. High-degree superheating is now invariably employed.

Feedwater heating is used to a limited extent on certain lines, and the Weir apparatus has been experimentally installed on several others, but the practice is still far from general. The use of oil for fuel continues to be the subject of experiment, but is still exceptional, though during the 1921 coal strike engines were adapted on many lines. Mention may be made of trials of the "Scarab" system on the L. & N.W.R. and other lines, while on the Great Central railway Mr. J. G. Robinson is stated to have obtained notable results from pulverized fuel and a "colloidal" mixture of pulverized coal and oil, also with the "Unolco" oil-burning equipment.

Recent locomotive practice tends towards the systematic adoption of the 4-6-0 type for express and ordinary passenger and fast-goods locomotives, while the 2-6-0 type has appeared on several lines for mixed-traffic duties. The former is often associated with the use of four high-pressure cylinders, and on several railways three-cylinder locomotives of various types have been placed in service, but the ordinary two-cylinder system is still the most general. Walschaert valve gear is becoming more and more widely used. On many railways large tank engines have been introduced, notably of the 4-6-2, 2-6-4, 4-4-4, 0-6-4, and 4-6-4 wheel arrangements, with 0-8-2 and 2-8-0 locomotives for heavy local goods and shunting work.

**Rolling Stock.**—In the carriage department there have been no special developments since 1910, though improvements in designs already in use have, of course, been made. To some extent, steel panels are being employed, and for electric rolling stock steel construction is now largely used. On the L. & Y.R. all-steel coaches are used on the Manchester-Bury electric route. To provide for rapid detrainment and entraining of passengers at busy "Underground" stations, new designs of rolling stock have been adopted, including three sets of double doors on each side, one midway and the others towards, but some distance from, the ends. Steadying pillars and hand-holds are superseding the straps hitherto provided for the convenience of standing passengers. On the goods and mineral side no special developments in rolling stock need to be referred to, except that the use of high-capacity wagons up to 50 tons' capacity is extending, though as yet to a limited extent only.

**Miscellaneous.**—During 1910 express locomotives of the G.W. and L. & N.W. railways were exchanged for comparative trial; also

between the Highland and North British, the L. & N.W. and North British, and the Great Southern & Western and Great Northern in Ireland. On April 4, 1914, the well-known horse "Dandy," which had so long worked the Port Carlisle branch of the North British railway, at last gave place to a steam train. On Dec. 19, 1915, occurred the disastrous landslide at "The Warren," Folkestone, necessitating the closing of the S.E. & C.R. main line between Folkestone and Dover throughout the war period. It was not reopened until Aug. 11, 1919.

#### BRITISH RAILWAYS UNDER WAR CONDITIONS

**Railway Executive Committee.**—As far back as 1865 an Engineer and Railway Staff Corps had been formed to provide an organization of railway managers, engineers and contractors who, in the event of war, would, under the direction of the military authorities, superintend the operation of railways and carry out such additional works as might be necessary. In 1866 the Army Railway Council was constituted, this body being known from 1903 as the War Railway Council. From these bodies was formed in Nov. 1912 the Railway Executive Committee, comprising the general managers of certain leading railways. The work of the Committee was mainly advisory, but included certain preparatory measures which bore good fruit when, on Aug. 4, 1914, on the declaration of war, nearly all railways in England, Scotland and Wales were taken over by the Government under the Regulation of the Forces Act 1871, and directed on behalf of the State by the Railway Executive Committee. It may be explained that this Committee was never intended to supersede the actual management of railways, but to issue directions and to co-ordinate the working of all lines concerned as required by the various emergencies as they arose. Otherwise, and notwithstanding the many un contemplated developments in the scope and operation of the Committee throughout the war period, the ruling principle was always that the officers of the respective railways should continue to operate their lines without State interference.

**Railway Control and Guarantee.**—The Act of 1871 provided that, to avoid the complexities of payment for services rendered and other difficulties which necessarily would have arisen, the Government guaranteed to make up any ascertained deficiency in the aggregate net receipts of all the railways taken over as compared with the aggregate for the corresponding period of 1913. Throughout the war period, therefore, all ordinary financial arrangements on the operating side ceased, and the work of the Railway Clearing House in regard to the division of receipts according to ownership of lines and various arrangements between companies was discontinued. The original agreement provided for adjustment according to the conditions during the first half of the year 1914 as compared with the corresponding period in 1913, but, when the question of war bonuses to railway workers to meet the higher cost of living arose early in 1915, it was agreed that this proviso should cease to operate in consideration of the first 25% of the war bonus conceded in Feb. 1915 being borne entirely by the companies, though all subsequent increases were undertaken by the State. In Aug. 1915 the Government accepted the principle of making allowances to the railway companies supplementary to the periodical compensation payments in respect of deferred maintenance and renewal. At a later stage agreements were made as to the payment of interest upon various capital works unproductive at the time of the outbreak of war, or completed and brought into use during the earlier war period, and in regard to many other complicating factors which arose. Some of these agreements occasioned severe strictures by Lord Colwyn's Committee on

Railway Agreements, whose report was issued early in 1921, but during the period of hostilities, and notwithstanding the very wide and to some extent undefined scope of control which was eventually forced upon the Railway Executive Committee, the arrangements made by the Committee on behalf of the State with the railway companies are generally regarded to have been reasonable and equitable.

**The Government Profit on Railways.**—It may be pointed out that, according to a Government return issued under date of April 30, 1919, if all Government traffic had been charged for at authorized pre-war rates the amounts would have been as follows for the periods stated:—

Aug. 5 to Dec. 31 1914	£ 3,500,000
Year 1915	10,279,104
Year 1916	20,649,126
Year 1917	35,698,554
Year 1918	41,917,024

Total . . . . . £112,043,808

For the corresponding periods the amounts which the Government had to provide by way of compensation were:—

Aug. 5 1914 to Dec. 31 1915	£15,946,839
Year 1916	14,039,674
Year 1917	24,075,768
Year 1918	41,251,326

Total . . . . . £95,313,607

Beside the actual working of the railways, the use of railway steamers, docks, canals, etc., represented a value estimated at from £10,000,000 to £15,000,000, while munition and similar work done (to the value of about £17,000,000) in railway workshops at cost price and therefore without profit to the companies, also the provision of locomotives, rolling stock, permanent way, etc., for use overseas, indicate the complexities of the arrangements ultimately entailed and the tremendous scope the utilization of the home railways for war purposes eventually attained. The Irish railways were not concerned at first in the Government control and guarantee. They were, however, taken over under similar conditions from Jan. 1, 1917. The appended table shows the manner in which the control of railways in association with the Government guarantee operated.

In other words, the aggregate of all the freight, munition, troop and passenger traffic carried on Government account, if charged for, would greatly have exceeded the sum payable by the Government to bring up the annual net receipts to the pre-war level. It has to be remembered, however, that arrears of maintenance and cost of replacement of stock, etc., apart from what was essential at the time, could not figure very prominently in the accounts until after the termination of hostilities. After the Armistice, however, heavy costs were entailed under these and other headings, while the reduction of Government traffic to the relatively very small figures of the post-war period converted the profit of the war years into a serious deficit. The fact remains, however, that while the war emergency continued the bargain made was a very good one for the State, and it was only in 1918 that the, by then, generous wage and war-bonus concessions to the railway staff tended to convert the profit to the State into a deficiency—even then a relatively small one.

**War Bonuses and Concessions to Staff.**—As showing the tremendous effect of these concessions it may be mentioned that for the financial year ended March 31, 1920, as compared with 1913, the increased cost of working the railways was estimated at £57,000,000 on account of war wage and other concessions, and

#### OPERATION OF GOVERNMENT GUARANTEE

	1915	1916	1917	1918
	£	£	£	£
Revenue earned by railways over expenditure <sup>1</sup>	45,171,403	49,420,063	53,885,849	44,068,105
Amount of compensation paid by Government to railway companies on basis of published accounts for 1913	46,130,000	46,319,000	46,515,000	46,576,000
Profit or Loss to Government	-958,597	+3,101,063	+7,370,849	-2,507,895

<sup>1</sup> Includes estimated value of services rendered by railways to the Government free of charge, as shown in White Paper, Cmd. 402, apart from value of services rendered to the Government in respect of steamboats, canals, docks, hotels, etc., estimated at from £10,000,000 to £15,000,000 for the war period.

from £20,000,000 to £25,000,000 due to the eight-hour day and further concessions then recently granted or under discussion. In the opinion of experts it is thought, however, that even these difficulties would not have arisen, at least in so acute a form, had it not been for the maintenance of pre-war rates and charges for goods traffic throughout the war period, while it was not until Jan. 1 1917 (June 1 1918 in Ireland) that ordinary passenger fares were increased by 50 per cent., and then mainly with the object of restricting travel rather than of raising revenue. Had adjustments been made stage by stage, as was done in the case of prices in general trade and industry, the financial situation in regard to railways would have been very greatly improved, and there would have been relatively little objection to the increase which became imperative in the post-war period.

**Mobilisation Traffic.**—Very complete plans for mobilization had been prepared by the Railway Executive Committee long before there was any probability of war, and continually revised and brought up to date, so that everything was ready for the wonderful transportation achievements which followed the declaration of war. Thus between Aug. 10 and 31 no fewer than 670 trains, coming from all parts of the country and conveying horses, guns, baggage and stores, as well as approximately 120,000 men of all ranks, were dealt with at Southampton Docks with little interference with ordinary civilian traffic. Throughout the war period achievements of this character were regularly accomplished at all the chief embarkation centres and there is no instance on record of the breakdown of railway arrangements at any time, even when the tremendous volume of munition and other traffic conducted in national interests, but not directly for war purposes, was also placed upon the railways.

**Public Railway Transport.**—During the war period it was necessary to impose many restrictions upon both passenger and goods traffic. Excursion and many cheap-fare facilities were early discontinued, as also tourist and certain other classes of tickets carrying special facilities. Continental traffic was, of course, subject to special regulations and from the outbreak of war Dover became a closed area, such continental steamer services as were maintained being diverted to other ports. In fact, at all the great railway ports there were severe restrictions upon civilian traffic. During 1916 further regulations came into force for passenger travel, following a process of deceleration of express trains, partly due to the insertion of stops to enable them to serve the purpose of trains which were withdrawn in order to free the lines for Government traffic, and partly in view of the exceptional loading which became general, and to ease the strain on permanent way, bridges, etc., which could not be maintained to usual standards. From Jan. 1 1917 still further restrictions were imposed upon railway travel and conveyance of luggage; restaurant cars were withdrawn entirely on many lines and reduced on others, and passenger traffic was allocated to specific routes where alternatives had hitherto been available for the same journeys. An increase of 50 per cent. was made upon ordinary passenger fares and from 10 to 20 per cent. on season tickets, the issue of which was regulated, while it was required that they should be shown by each passenger on every journey made. Certain branch lines were closed, most of the rail-motor intermediate services withdrawn, and a large number of stations closed.

**Release of Railwaymen.**—An important object of these reductions in train services and facilities was to enable railwaymen to be released to serve with the forces, and altogether no fewer than 184,475 men were thus contributed. This figure represented 49 per cent. of the staff of military age in railway employ on Aug. 4 1914. Large numbers of men, apart from Reservists and Territorials, had, of course, joined voluntarily quite early in the war, but the general enlistment of railwaymen was not favoured until 1916, by which time a definite scheme of release had been adopted on a system which reduced inconvenience to the railway companies to a minimum and yet enabled reasonable proportions of men to be supplied.

**Railway Officers in Government Service.**—Throughout the war railway officers of many grades were freely utilized by the Government, some for special duties involving commissioned rank in the army or navy, and others for rendering expert assistance in civilian capacities to various Government departments. In fact, a considerable number of railway officers in high positions were given

important Government appointments in connexion with various existing and new State departments. In other instances, railway officers were temporarily loaned to the Government.

**Employment of Women.**—Comparatively early in the war women were introduced into many ranks of the railway service, and in due course they were seen on a wide variety of work—at passenger and goods stations and depots, in engine sheds, on electric trains as “gatemen” and in a few instances as guards, on cartage and delivery vans, and in the railway workshops, in addition to more obvious employment as clerks, waitresses and in booking-offices. To some extent these measures were rendered practicable by the discontinuance of the more complicated travel facilities, the reduction of record-keeping to a minimum, the abolition of detailed statements between railway companies and Railway Clearing House work; but to a great extent women were employed in direct replacement of men who had been released with but little adjustment of their duties. A total of 55,000 women were thus employed in railway working, and about 6,000 on munition work in railway shops.

**Goods and Mineral Traffic Allocation.**—Goods and mineral traffic, especially when the manufacture of munitions on a very large scale was going on all over the country under Government direction, became of vital importance, and all other traffic was made subservient thereto. For the control of non-Government traffic a system of allocation was widely adopted, requiring consignors to despatch their goods by specified routes and from particular depots and sometimes on particular days, according to destination, while at times it was necessary to refuse to accept traffic for a time. Arrangements had already been made between the leading railway companies in regard to “common user” of wagons of ordinary type, while private owners' wagons were brought into the “pool.”

**Coal Control.**—A system of coal control was adopted in 1917, partly due to the necessary discontinuance of a large proportion of the normal coastal water-borne conveyance of coal, by which each part of the country drew its coal supplies from specified colliery areas, and this traffic alone represented an enormous burden.

**Military and Naval Traffic.**—For the needs of the Army and Navy facilities on a very large scale had to be provided. Apart from the movements of troops for service overseas, continual streams of traffic passed to and from the training camps. Leave travel, however restricted, was inevitably a very big factor, and, as the war progressed, ambulance trains passed very frequently between the Channel ports and hospitals in various parts of the country. Among special facilities which had thus to be afforded may be mentioned the naval leave trains which ran regularly between the north of Scotland and London in connexion with the fleet in northern waters, while a continuous stream of coal trains had to be run between South Wales and other suitable coal areas and the far north of Scotland for the use of naval vessels. One of the chief difficulties, indeed, was the need for using the Highland railway for naval traffic on so large a scale, and parts of this were doubled during the war in order to relieve the congestion which necessarily followed the lengthy single-track mileage of this, as it proved, vitally important line.

**Munition Traffic.**—Widespread munition manufacture necessarily occasioned a great deal of civilian traffic directly and indirectly in national interests, while in a number of places ordinarily quiet stations or branches became very busy owing to the erection of army camps or of munition works. A few stations had to be specially erected and several new branch lines made.

**Railway Docks and Harbours.**—As owners of several of the best-equipped docks and harbours, including new ones such as Immingham, G.C.R., and the King George Dock at Hull, H. & B. and N.E. Railways, and the new lock entrance at Newport, Alexandra (Newport & South Wales) Docks & Railway, brought into use shortly before the outbreak of war, in addition to the older ones, such as Southampton, the railways provided the nation with some of the most complete embarkation depots. Most of these became closed areas, and all of them were used to their fullest capacity, either for direct war traffic or when the submarine menace diverted shipping traffic from its accustomed ports.

**Railway Steamers.**—Railway steamers also were widely used, and of a total of 218 vessels 126 were taken over and 36 lost from various causes. They were used as transports, for the maintenance of national supplies, as minesweepers, and as hospital ships. Frequently even those which remained on regular services had to assist in meeting emergencies, such as the evacuation of Belgian refugees.

**Railways and Air Raids.**—An important difficulty arising from the railways had to do with that due to the numerous air raids over Great Britain. Relatively little serious damage was done, but the fact that traffic had often to be or worked under difficulties, the reduced lighting generally maintained throughout the more vulnerable parts of the country, and the congestion which followed each cessation of traffic constituted serious hindrances to railway working.

**Armoured Trains.**—Throughout the war period, too, the possibility of invasion had to be faced, and many special arrangements made with a view to the possible need for transferring the civilian population from the coast towns to the interior. Several armoured trains were constructed in the railway workshops, though they were never called upon for use under service conditions.

**Miscellaneous.**—At many of the principal railway stations free buffets were installed for the benefit of soldiers and sailors; and in

some cases these provided special facilities, as at Victoria, S.E. & C.R., where arrangements were made for the exchange of French for English money, the amount dealt with reaching a total of approximately £10,000,000. At one period the railways were severely congested by the traffic due to the evacuation of Belgium, and one result of this was the continual stream of Belgian soldiers coming to England on leave to visit their families, a total of 237,000 thus travelling. At many stations local bodies, such as the V.A.D., etc., made very complete arrangements for providing refreshments to soldiers travelling through and for attendance upon the ambulance trains. Frequently valuable assistance was given by the various ambulance associations belonging to the railway service.

#### BRITISH RAILWAY WORK IN THE WAR

During the war period British railways rendered essential services on a very large scale, both in regard to traffic requirements at home and those associated with active service in the various war areas. To some extent the former has already been covered by general reference, but further details must be given.

**Military and Naval Special Trains.**—Between the declaration of war and the date of the Armistice all the larger railways were called upon to run special trains conveying officers and men, frequently with guns, ammunition, horses and equipment, when passing to a port for embarkation to France or other theatres of war. There were also transfers of units between camps, leave travel and special events, such as the arrival of Canadian, S. African and other contingents from abroad and their journeys from ports of arrival to training centres, together with that portion of the American army which passed through the United Kingdom. In the aggregate the numbers of special trains operated by the leading railways were very great, and the following table shows, as far as information is available, the number of special trains mainly, if not exclusively, on the passenger side, run by the railways mentioned, with the numbers of officers and men who travelled:—

	Trains	Officers and Men conveyed
L. & S.W.R.	58,859	20,223,954
L. & N.W.R.	56,470	22,268,000
G.W.R.	33,615	—
N.E.R.	24,172	11,810,290
L.B. & S.C.R.	27,366	—
G.E.R.	13,000	6,231,293
G.C.R.	5,963	2,656,726

Three other railways may be mentioned, though their totals include also ambulance trains, goods and other specials:—

	Trains	Officers and Men conveyed
S.E. & C.R.	163,000	12,141,933
M.R.	11,502	2,282,000
N.B.R.	45,000	—

The numbers of special trains required on the freight side are more indefinite, as they included many trains run to meet the needs of the Government munition undertakings and of coal traffic passing from the colliery areas to the Fleet bases, and, to some extent, in connexion with the coal control scheme. However, it may be mentioned that on the London, Brighton & South Coast railway no fewer than 53,376 special trains were run mainly for traffic to and from the ports on the system. On the Great Western railway the total was 63,349 and on the Great Eastern railway 11,000. To meet the needs of the Fleet several railways ran 20 or even more trains per day conveying Admiralty coal. The arrival of the American army in Great Britain entailed the running of 1,684 special trains on the London & North-Western railway and 1,139 on the Great Western railway. When the Canadian contingents first arrived in England the London & South-Western railway was required to run 92 specials from Plymouth alone.

**Ambulance Trains.**—For home service a total of 20 trains was equipped for army use: G.C.R. 3; G.E.R. 2; G.W.R. 4; L. & Y.R. 2; L. & N.W.R. 5; L. & S.W.R. 2; M.R. 2. There were also two in Ireland, one each equipped by the G.N. and G.S. & W. railways. Five naval ambulance trains were also in use, these differing somewhat in regard to internal arrangements and equipment. Many individual vehicles were also fitted for the purpose of conveying small numbers of men in ordinary trains, and there were nine other trains

sufficiently equipped to be brought into use as emergency ambulance trains. For service overseas 30 ambulance trains were equipped by the home railways, each consisting of 16 bogie coaches. These were supplied as follows: G.C.R. 1; G.E.R. 4; G.W.R. 8; L. & Y.R. 3; L. & N.W.R. 7; L. & S.W.R. 1; L.B. & S.C.R. 1; M.R. 2; N.E.R. 1; L. & N.W.R. and G.E.R. 1 jointly. L. & N.W.R. and L.B. & S.C.R. 1 jointly. Two trains presented by the United Kingdom Flour Millers' Association were constructed by the G.E. and G.W. railways jointly, and the Lord Michelham (or "Queen Mary") presentation train was equipped by the L.B. & S.C. and L. & N.W. railways. A further train, known as the Princess Christian Hospital Train, was built by the Birmingham Carriage & Wagon Company. A majority of these trains was employed in France, but two went to Egypt and one to Salonika. When the American army came arrangements were made for 19 other trains, of the same general type as those previously supplied for overseas service, to be equipped by British railways for the use of the U.S.A. forces in France, as follows: G.C.R. 1; G.E.R. 1; G.W.R. 4; L. & Y.R. 3; L. & N.W.R. 4; L. & S.W.R. 1; M.R. 5. Twenty-nine others were on order at the date of the Armistice, when, of course, work was at once suspended. Including spare and extra vehicles, a total of 822 vehicles was thus adapted for the Government trains, and 304 for the U.S. trains.

The following numbers of journeys made by ambulance trains on various railways will indicate the enormous volume of this traffic, these figures applying, of course, only to the ambulance trains running on the home railways: L. & N.W.R. 13,318; L. & S.W.R. 10,173; S.E. & C.R. 7,515; G.W.R. 5,000; M.R. 3,982; N.E.R. 1,800; G.E.R. 1,172. This traffic was dealt with at various ports, but it is worthy of note that no fewer than 3,166 were despatched from the new Marine station at Dover, uncompleted at the time of the outbreak of war, but finished off at an early date sufficiently to serve for the transfer of wounded men.

**Troop Movement and other Military Traffic.**—The numbers of special trains given above will indicate the enormous dimensions which the traffic entailed by troop movement involved. At suitable places large numbers of both passenger and goods vehicles had to be kept in reserve to provide for movements of troops at short notice, and many of the cross-country or connecting lines proved of special value in enabling through journeys to be made from one system to another and by providing alternative routes to avoid congestion. The North London, Hampstead Junction, and North and South-West Junction railways carried nearly 14,000 special trains, and on several dates public traffic was entirely discontinued. The "widened" lines of the Metropolitan railway, through Farringdon Street and the connexion to the South-Eastern & Chatham railway at Ludgate Hill, were used by no fewer than 626,000 special passenger or goods trains, though this route was restricted by the limited loading gauge and could not, therefore, be used for ambulance trains and certain other traffic. The West London railway dealt with about 150 troop or special trains per month, and the East London a gross total of about 1,000. Bearing in mind that the magnitude of the forces involved a tremendous amount of leave travel, it may be mentioned that, during 1917 only, over 28,000,000 of H.M. forces travelled free by warrant on the home railways, while nearly 2,000,000 journeys were similarly made by civilians in Government service.

**Traffic at Ports.**—Dover was largely used as a centre for ambulance train traffic, but at Southampton a very large volume of stores, munitions and other material was dealt with, besides a considerable amount of shipping traffic necessarily continued. The Southampton train ferry to Dieppe was brought into use in Nov. 1917, that at Richborough, near Sandwich, being completed with Feb. 1918. Both enabled goods wagons to be sent across without transhipment, and they were especially useful for the conveyance of tanks, heavy guns, locomotives, etc. Avonmouth, Devonport and Liverpool were used as ports for supplying the Mediterranean and Mesopotamian forces. Immingham and other East Coast ports were largely used for supplying the fleets in more southern waters, while Leith, Aberdeen, Invergordon, Thurso and other Scottish centres were kept very busy in meeting the demands of the Grand Fleet. Newhaven and Littlehampton together dealt with nearly 7,000,000 tons of traffic on war account. In addition to the steamer traffic across the Channel the South Coast ports, including Richborough, sent over 1,000,000 tons by means of sea-going barges.

**Munition and Admiralty Coal Traffic.**—Besides the traffic directly required for the army and navy, the railways had to meet many other traffic requirements, as indicated by the following: The South-Eastern & Chatham railway alone conveyed nearly 200,000 tons of army mails, parcel-post packages and lighter stores not dealt with in bulk, via Dover and Folkestone. On the London & North-Western railway nearly 16,000 trains were run for the conveyance of Admiralty coal. In many parts of the country extensive forestry work was undertaken, and the conveyance of the cut timber amounted to hundreds of thousands of tons on many railways. On the North-Eastern railway the tonnage of goods conveyed on Government account amounted to 5,500,000, and of Admiralty coal nearly 12,000,000 tons, while to serve the numerous munition centres in the north-eastern area involved the conveyance of some 84,000,000 workpiece. On the Great Western railway at one time no fewer than 366 additional trains had to be run daily, solely for the conveyance of workers to the various war factories.

**Locomotives and Rolling Stock sent Overseas.**—A number of locomotives under construction for various colonial and foreign railways were commandeered by the Government and diverted for use in France and elsewhere, while large orders were given for the building of engines by British firms for use in France. A total of 247, of a contemplated order for 500 of the 2-8-0 type alone, was constructed. But to meet immediate needs it was necessary for British railways to supply considerable numbers of engines from their own stocks, mainly for France, though some went to Egypt, Mesopotamia, and Salonika. The total locomotives thus supplied numbered 675, of which the L. & N.W.R. provided 111; G.W.R. 95; M.R. 78; N.E.R. 50; G.C.R. 33; and G.N.R. 23; the remainder being sent by other companies. In addition, 30,000 goods wagons were sent overseas, together with 100 special wagons and 40 30-ton coal wagons. The Great Central railway constructed six engines to the design adopted for the War Department 2-8-0 locomotives which were in fact, substantially to G.C.R. designs; 2,500 20-ton covered wagons were built in railway workshops.

Besides the standard-gauge rolling stock, large numbers of steam, petrol, and petrol-electric locomotives of small types, and wagons of various designs, for use on the light railways in France, were built by various firms, though not much of this work was done by the railway companies beyond the equipment of Ford cars as rail tractors at Crewe Works. A considerable amount of permanent way was, however, sent overseas by the home railway companies, partly by taking up certain light-traffic branch lines or by converting double lines to single track, and also to a considerable extent from stock. A great quantity of bridge parts, machinery, cranes and other material was also supplied from stock, while the equipment of the army railway workshops in France was largely provided by the various railway companies.

**War Work in Railway Shops.**—As already mentioned, this was undertaken to the value of about £17,000,000, and covered a wide range of products—from ambulance stretchers, road vans and gun-carriages to the repair of cartridge cases and the production of shell cases, frequently of large sizes. Several travelling workshop trains were also equipped in the British railway shops. In a number of instances, too, railway companies undertook the repair of Belgian and other locomotives sent over from France.

**The Railway Troops.**—As already mentioned, a total of 184,475 men was released from railway service to join H.M. forces. They were largely utilized in the formation of, or transferred to, the various sections known generically as the Railway Troops attached to the Royal Engineers. A number of the companies were recruited mainly from the men of a particular railway, especially in the case of the L. & N.W.R. (115th) and the G.W.R. (116th, 262nd and 275th), while the 118th was recruited chiefly from the G.E. and N.E. railways. There were two principal sections, the Railway Construction Troops and the Railway Operating Division, the former numbering 35 companies and the latter 42½ companies, including those dealing with the light railways. Besides these there were Labour, Roads, Canadian Overseas Construction, Canadian Operating, S. African and Australian companies, bringing the total to 118½ companies. The various camp railways were also supplied from these bodies.

#### THE POST-ARMISTICE PERIOD

On the cessation of active hostilities the pressure of war traffic at once eased, though it was some weeks before Government traffic materially decreased in volume. Necessarily, for some time afterwards the completion of work in hand and the traffic occasioned thereby kept the railways fairly busy, though with less urgency and strain. Leave travel was even more freely given, and the demobilization of the forces for many months placed a big strain upon the railways on the passenger side. National traffic on the goods side, too, remained heavy, as systems of control of food-stuffs, coal and necessities could not at once be discontinued, and was further complicated by the public call for the return of unrestricted transit conditions, for improvements in facilities, and for a resumption of the relative freedom of pre-war conditions. There were also tremendous arrears of construction and maintenance of railway permanent way and rolling stock to be overtaken.

**Demobilization of the Forces.**—This traffic was a very big thing in itself, and numerous special trains had to be run between the ports and the demobilization centres. It was estimated that 40,000 men would be dealt with daily, and that was about the number realized. But the effect of public pressure caused great irregularity, and, as a result, the railways had to deal with much of this traffic—which also included the dispersal journeys of men from the demobilization centres—as best they could. One dispersal depot alone thus dealt with over 1,000,000 men. Horses had also to be conveyed in large numbers, many being brought back in through trucks *via* the Channel train-ferries.

Their sale, also the large traffic occasioned by the return of rolling stock and material from overseas, and the sale of army stocks of all kinds under the direction of the Disposals Board, added appreciably to the work of the railways.

**Arrears of Maintenance and Construction.**—The work thus involved was necessarily of great volume and expense. It entailed relaying of lines, repair and reconstruction of bridges, completion of deferred new works, repair of locomotives and rolling stock, and the construction of overdue replacements. In addition certain war extensions had to be dismantled, and workshops cleared of special machinery, and not a few new machines added in place of those which had become worn out. Public opinion ceased to look quite so favourably upon the large expenditure thus incurred. The companies had, of course, placed to reserve large sums in view of this work, but as they had been limited to net receipts on a pre-war basis, these were necessarily on pre-war standards, though usually with increases as far as practicable, whereas when the money had to be spent costs of materials and labour had increased approximately threefold. Agreements made between the Government and the companies provided for the difference being made up, but the amounts involved became so great that in Oct. 1920 a Committee was appointed to report upon these agreements. In large measure this was little more than a sop to public opinion, for the report of Lord Colwyn's Committee, as it is generally called, took little account of the merits of the case, and appeared mainly concerned with a solution which presented very much the appearance of repudiation of agreements when they became unpleasantly expensive. However, it was generally realized that these costs were the inevitable corollary to the great benefits, and actual profit as shown in a previous section, obtained by the nation from the railways during the war period; and a settlement was ultimately arrived at in May 1921, providing for the payment in two instalments of £60,000,000, after the termination of Government control in Aug. 1921. Until then the arrangements already adopted for monthly payments in respect of arrears of construction and maintenance were continued. This solution avoided much prospective litigation and represented a reasonable degree of give-and-take on both sides. The Colwyn Report suggested that a total of £156,000,000 would thus be involved, but this was given without data and was almost certainly overstated. Payments already made must be considered in conjunction with the £60,000,000 accepted in settlement. The corresponding amount agreed upon in respect of the Irish railways was £3,000,000.

**Railway Guarantee and the Subsidy.**—As Government traffic diminished in volume, and more and more national traffics were returned with de-control to private enterprise, the effect of the high cost of materials and supplies, and the generous wage and other concessions, quickly resulted in the railways requiring considerable subsidies. At the end of 1919 belated action was taken to increase railway charges to an economic level, the lack of which action had largely caused the very serious position which arose after the conclusion of active hostilities. Thus, whereas the amount of Government compensation in 1918 was £46,576,000, and the receipts, including the estimated value of Government traffic, £44,068,105 on account of railway working alone, for the year ended March 31 1920 the realized deficit amounted to £1,349,530, even after allowing for certain increases in charges which came into force during that period. And for the 1920-1 period the net Exchequer liability was estimated at £54,500,000.

**Wage Concessions and Increased Costs.**—These provide the chief explanation for the large subsidies entailed, expenses having risen nearly 200% and receipts an average of only 80% as compared with 1913, the year upon which the Government guarantee of net receipts was based. Thus the gross receipts, expenditure and net receipts for 1913, 1919 and 1920 were:—

	1913	1919	1920
Gross Receipts	£129,194,000	£226,363,000	£298,249,000
Expenditure	£83,385,000	£180,098,000	£251,575,000
Net Receipts (Railway)	£45,809,000	£46,265,000	£46,674,000

In the case of four representative railways, English, Scotch, Irish and Welsh, wages and salaries alone showed the following increases:—

	1913	1920
London and North-Western	£6,000,000	£20,000,000
North British	£1,660,000	£6,600,000
Great Northern (Ireland)	£357,000	£1,406,000
Taff Vale	£384,000	£1,187,000

War-time concessions consisted mainly of the flat-rate allowances of 33s. per week, reached by successive increases in view of the rising cost of living, but after the Armistice action was taken by the Railwaymen's Unions in respect of the eight-hour day (granted from Feb. 1 1919), standardizing of wages and grading. The eight-hour day caused many difficulties and is necessarily costly, especially as it had to be equalized for many men whose wages were not calculated on that basis. Throughout 1919 there were continual labour difficulties, and a serious strike lasted from Sept. 26 until Oct. 5, settled by an agreement that no reductions in wages should occur before Sept. 30 1920, and the whole matter thoroughly explored. In Oct. 1919 Central and National Wages Boards were set up. In Jan. 1920 an agreement was announced providing for an addition to the wages of each grade of 38s. per week and for cost of living allowances rising or falling in accordance with Board of Trade figures, with standardized rates of pay which should not fall below 100% over pre-war rates. This was at first objected to, but was accepted on Jan. 15 1920. Subsequent negotiations dealt with supervisory and other grades. Certain further advances were given in June 1920, and in view of the accompanying costs of materials and supplies it will be understood that these additions much more than balanced the alleged railway "subsidies."

*Ministry of Transport.*—An announcement, apparently unauthorized, by Mr. Winston Churchill in Dec. 1918, that nationalization of the railways was contemplated caused a great deal of misunderstanding. There were, however, many matters requiring attention, and these together resulted in the bill for establishing a Ministry of Ways and Communications presented to Parliament in Feb. 1919. As first introduced its contemplated scope and powers were considered to be too far-reaching, but in a modified form it was passed as the Ministry of Transport Act, receiving Royal Assent on Aug. 26 1919, the Ministry being established as from Sept. 23 1919. The Ministry took over several sections of existing departments, including the Railway Department of the Board of Trade and the Roads Board. The Railway Executive Committee continued as such until Jan. 1 1920, but most of its members were retained on the Railway Advisory Committee. Various other advisory and reporting committees have since been established.

*Rates, Fares and Charges.*—Apart from the 50% increase in ordinary passenger fares, and of 10 to 20% increases in season-ticket charges, railway rates remained as in pre-war years until the Ministry of Transport announced increases in demurrage rates as from Jan. 1 1920, and of 50% on goods rates as from Jan. 15 1920. These were followed on Aug. 6 by further increases bringing ordinary passenger fares up to 75% and season tickets 50% over pre-war rates, and from Sept. 1920 workmen's tickets were increased, and goods rates raised to substantially 100%. On Dec. 22 1920 the Rates Advisory Committee of the Ministry of Transport reported on the general question of rates and charges, and their recommendations materially influenced the Railway Bill placed before Parliament on May 11 1921.

*Grouping and the Future of Railways.*—One of the provisions of the Ministry of Transport Act was that a policy for the future of the home railways should be promulgated within two years. An outline of proposals was issued in July 1920, suggesting, *inter alia*, the amalgamation of railways into groups as follows: (1) *Southern*, combining the South-Eastern & Chatham, the Brighton, and the South-Western; (2) *Western*, the present Great Western system with the Welsh lines; (3) *North-Western*, combining the North-Western, the Midland and the Lancashire & Yorkshire, North Staffordshire and Furness; (4) *Eastern*, combining the Great Northern, the Great Central, and the

Great Eastern; (5) *North-Eastern*, the present North-Eastern system and the Hull & Barnsley; (6) *London Group* (local lines); and (7) a *Scottish Group* for the whole of Scotland. These proposals were severely criticized, and the Railway Companies' Association adopted the following alternative: *Group 1*, London & North-Western, Midland, Lancashire & Yorkshire, North Staffordshire, Furness, Caledonian, Glasgow & South-Western, and Highland railways; *Group 2*, Great Central, Great Northern, Great Eastern, Hull & Barnsley, North-Eastern, North British, and Great North of Scotland railways; *Group 3*, Great Western and Welsh lines; *Group 4*, London & South-Western, London, Brighton & South Coast, and South-Eastern & Chatham railways; *Group 5*, London railways (local lines). On May 11 1921 the promised bill was placed before Parliament, and embodied the following modified scheme: (1) *Southern Group*, London & South-Western, London, Brighton & South Coast, South-Eastern, and London Chatham & Dover railways; (2) *Western Group*, Great Western and Welsh railways; (3) *North-Western and Midland Group*, London & North-Western, Midland, Lancashire & Yorkshire, North Staffordshire and Furness railways; (4) *North-Eastern and Eastern Group*, North Eastern, Great Central, Great Eastern, Great Northern and Hull & Barnsley railways; (5) *West Scottish Group*, Caledonian, Glasgow & South-Western and Highland railways; (6) *East Scottish Group*, North British and Great North of Scotland Railways. During proceedings in Committee of the House of Commons the 5th group was combined with the 1st, and the 6th with the 2nd, substantially as proposed by the Railway Companies' Association, and the Act, which received Royal Assent on Aug. 19 1921, therefore provides for four groups only:—Southern; Western; North-Western, Midland and West Scottish; North-Eastern, Eastern and East Scottish. Amalgamation is to become effective on July 1 1923. The proposed London group was dropped in view of proposals for the setting-up of a London Traffic Board. Provisions were also made for the inclusion of representatives of the Railwaymen's Unions in association with railway officers on advisory councils, etc. (not as directors as at first claimed), and for the continuance of the Central, National and local Wages Board. It was considered that these provisions, some of which represented agreements already made in conjunction with the fare and rate increases in force according to the proposals of the Rates Advisory Committee, would enable the railway companies to operate under solvent and economic conditions on the termination of control on Aug. 15 1921. In regard to amalgamation it may be mentioned that early in 1921 preliminary arrangements of this character had already been made in regard to the North-Eastern and Hull & Barnsley railways, and the London & North-Western and Lancashire & Yorkshire railways, in addition to several smaller companies to be absorbed by their larger neighbours. The chief difficulty, in fact, was in regard to Scottish railways, which, it was claimed, would be so seriously affected that they could not hold their own in a group by themselves, the alternative of amalgamation with appropriate associated English companies being favoured. Hence the altered grouping adopted by the Act as finally passed. Control was actually terminated at midnight on Aug. 15 1921.

*Restoration of Facilities.*—During the war many usual facilities of travel were withdrawn, but during 1920-1 a number were restored, as follows: pre-war luggage allowance for passenger-train traffic, June 14 1920; passengers' luggage in advance, July 1 1920; day excursion tickets, Aug. 12 1920; period excursion tickets, Dec. 24 1920; week-end tickets, May 11 1921 (deferred, owing to the coal strike, until Aug. 20, and Aug. 19 in the case of commercial travellers). G.E.R. continental services were resumed Feb. 25 1919; L.B. & S.C.R., June 1 1919; the Dover-Calais route, S.E. & C.R., Jan. 8 1920; and the Hull and Zeebrugge route, N.E. & L. & Y. railways, May 14 1920. Express-train running was rapidly restored to a good level during 1920, and though still below pre-war standards the main line services on all routes became very creditable in July 1921, both for speed and number. On some lines, indeed, pre-war schedules were definitely reinstated, and in certain instances facilities were even better than before the war. The suburban traffic problem was, however, still serious. On the "Underground" lines new rolling stock, when delivered, materially eased the inevitable congestion. An arrangement had been made during the war whereby the associated "Underground" railways, of which the

Metropolitan District only was controlled and subject to Government guarantee, should pool their receipts, including also the London General Omnibus Company. To meet the peculiar conditions of the situation a special Act of Parliament was passed, and from Sept. 26 1920 these lines were empowered, to charge "revised fares," the Metropolitan District railway ceasing to come under the guarantee. Allocation of passenger travel to specific routes, already partly in desuetude, partially disappeared during the early months of 1921, and finally in July of that year.

**Goods Traffic.**—During 1920 most of the special regulations imposed under war conditions disappeared, though the common-user of wagons still continued, and by cooperative action it had become possible to realize a higher standard of wagon loading. Commencing with the four weeks ending Jan. 29 1920, the Ministry of Transport commenced to issue detailed statistics of goods traffic operation, and on the completion of twelve months these were altered to agree with the calendar months, in combination with corresponding passenger traffic statistics. (J. A. K.)

#### UNITED STATES

The decade 1910-20 was marked by many fundamentally important developments in organization, management, and public regulation of American railways. During the early part of the period a tendency, which had begun during the latter half of the preceding decade, toward a decreasing rate of return on the investment in railways caused serious financial distress and a marked decline from the normal rate of development of railway facilities, equipment and service. The years 1915 and 1916 brought large increases in freight tonnage through the transportation of war materials for the Allies. The active participation of the United States in the World War, beginning in April 1917, made even greater demands upon facilities already overtaxed. To meet these demands the railways tried the experiment of voluntary unification through a committee of railway presidents clothed with plenary power by the boards of directors of practically all railway companies to operate the railways as one national system during the war. In the national emergency, in which the closest possible coordination of the agencies of transportation with the several branches of the Federal Government was absolutely essential, the experiment of voluntary unification was not satisfactory, and on Jan. 1 1918, as a temporary war measure, the railways were taken over by the Government, to be operated by a director-general responsible to the President. Federal operation continued until March 1 1920, when the railways were returned to private operation under the terms of the Transportation Act of that year. That Act fundamentally amended the existing policy of national regulation of railways and extended the powers of the Interstate Commerce Commission. Principally because of the serious business depression of 1920-1, and the decline in the volume of railway traffic, the results of the first year of operation under the Transportation Act were disappointing. In the summer of 1921 the subject again was commanding national attention. A choice among three policies was then incumbent upon Congress: (1) to rely upon private ownership and operation under the principles of the Transportation Act (hereinafter described) to take care of the situation when business conditions became normal; (2) to make some compromise between a policy of private control and initiative and Government operation or ownership; and (3) completely to nationalize the railways.

**Pre-War Conditions and Legislation.**—The 1910 amendment to the original (1887) Act to regulate commerce (see 22-830) created the Commerce Court to act upon appeals from decisions of the Interstate Commerce Commission. The new court was intended to specialize in the technique of transportation and to expedite the determination of cases theretofore passed upon by Federal courts of general jurisdiction with crowded dockets containing cases of all kinds. In many of its early decisions the Commerce Court overruled the Interstate Commerce Commission; and, because it appeared to limit the effectiveness of the Commission, the Court became unpopular. The public attitude toward railways at that time was unfriendly, and Congress responded to public pressure by abolishing the Commerce Court in 1913.

In response to an insistent public demand, growing out of the belief that the railways were being allowed to earn returns on fictitious capitalization, the Federal Valuation Act was passed in 1913. The Act required the Interstate Commerce Commission to determine the physical valuation of the railways individually, as of June 30 1914, and to cause records to be kept which would accurately

reflect all changes in property values after that date. Three bases were prescribed tentatively: (1) original cost to date, in the cases where the information could be obtained; (2) estimated cost of reproduction, new; and (3) estimated cost of reproduction, new, less depreciation. The work of determining values had been in progress since 1914, but no final figures were available in 1921 or expected until 1923 at earliest, although tentative valuations of a few properties had been made public.

Another piece of legislation, known as the Clayton Act, of 1914, contains a section which has an important bearing upon railways. The Act was intended to strengthen the so-called Anti-Trust Act and to prevent collusion between directors and officers of railways and directors and officers of manufacturing and other concerns dealing in railway equipment, coal and other supplies. It requires that contracts for supplies which will cost more than \$50,000 must be open to competitive bids invited by advertisements. A railway company is prohibited from having dealings in excess of \$50,000 per year with a concern having a director, officer or agent who is also a director, officer or agent of the railway. The Act was to be in force from 1916, but because of war conditions the effective date was postponed until Jan. 1 1921.

About 1906 a downward tendency began to be apparent in the rate of return on railway investment. This change restricted the flow of new capital into railway development—new lines and improvements of existing lines. The traditional policy of American railways had been to keep their facilities well ahead of the demands of growing traffic. In view of the fact that the volume of freight traffic doubles about every 12 years, and that the numbers of passengers carried one mile doubles about every 15 years, the need of such a policy is apparent. The practice of the conservative railways was to "plough in" a substantial part of their net income each year by making improvements out of income instead of issuing new securities. Such a policy, however, could not be continued with constantly diminishing net income. The downward tendency in the rate of return was caused in part by a hardening of the rate structure through a more inflexible policy of public regulation, in part by steadily increasing costs of wages and materials, and in part by the greater difficulty of finding means through economies and new operating methods of overcoming increasing costs. With declining net returns, and a general lack of confidence on the part of the public toward railways, railway securities lost their attraction, and investors sought other fields. The railways experienced much difficulty in obtaining new capital for the additional facilities required to keep their plants in step with traffic growth, and many of the weak lines reached such financial straits that they could not maintain their solvency. The cumulative effect of these tendencies reached the climax in 1915 when 42,000 m., or about one-sixth of the entire mileage of the country, was in the hands of receivers, and when less new mileage was built than in any year since the period of the Civil War.

**Effects of the World War.**—This was the situation when the effect of the World War was first felt by American railways. The orders from the Allies for munitions and other war supplies caused a sudden increase in freight tonnage. The additional revenues acted as a stay against financial distress, but the railways found their traffic-carrying capacity taxed to the full. Then came the added traffic burden when the United States entered the war in April 1917.

To meet the emergency the railways, through the American Railway Association, organized a railroad war board and delegated to its five members complete control over operation. The purpose was to coordinate management under private ownership and control so that the railways, during the war emergency, would merge their merely individual and competitive activities in the effort to produce the maximum of transportation efficiency. The board did much to increase the capacity of the railways through unified operation and common use of facilities, and during the first six months following voluntary unification, the heavily increased traffic was handled satisfactorily. But during the late autumn and early winter of 1917 acute traffic congestion occurred at the Atlantic seaboard ports, through which the greater part of the war supplies was exported, and the blockade extended back to the important inland industrial centres. The congestion was caused by several factors, among which two were outstanding. One has already been mentioned—the financial inability of the railways to keep up their former programmes of providing additional facilities in advance of traffic needs. The second was the lack of effective coordination between the railways and the several branches of the Government, each of which demanded priority of movement for its freight, thereby creating great confusion. The congestion and its interference with traffic, the perilous financial condition of the railways, the spirit of unrest among railway employees because of the greatly increased wage rates paid by manufacturing and ship-building plants, and the need of better coordination of all agencies essential to the successful prosecution of the war, led to the President's proclamation of Dec. 26 1917, taking over the railways to be operated by the Government from Jan. 1 1918. The Government could advance the funds required to provide the additional facilities urgently needed for war purposes; by paying a rental equivalent to pre-war net operating income it could prevent further bankruptcy of railway companies; by paying higher wages than the railway companies were able to pay, it could remove the cause of unrest among em-

employees; by making the railways a branch of the Government it could more effectively coordinate transportation with other Government activities; and by the complete temporary elimination of lines of corporate interest a more effective unification of all facilities and equipment would be possible.

*Federal Control in the War.*—The Federal Control Act of 1918 provided that the railways should be operated for the President by a director-general of railroads. Practically all of the railways were taken over, and were operated, with little change in the individual units, by Federal managers (in nearly all cases the former operating executive) reporting to regional directors, seven in all, who in turn reported to the director-general. The latter was assisted by staff-directors in charge of the several divisions—law, finance, purchasing, traffic, operation, labour, accounting, public service and capital expenditures. With few exceptions the entire organization, from the Federal managers to the regional and division directors, was made up of men carefully selected from the railway service. Political influence had no play in appointment. The Act provided that the railways should be returned to their owners for private operation within 21 months after the signing of the treaty of peace. The Government during the period of Federal control was required to keep up the usual standards of maintenance, so that the properties would be returned at the end of Federal control in as good condition and as complete in equipment as when taken. Failing to do this, the railway companies were to be compensated for the deficiencies. The annual rental was set as a sum equal to the average annual net operating income earned by the companies during the three years ended June 30 1917. The principles of unification and consolidation of facilities and equipment were carried much further by the director-general than by the Railroad War Board. Terminals and other facilities, and locomotives and cars, were used in common. Advertising, soliciting, off-line agencies, and other normal competitive activities were abolished. Traffic was routed by the most convenient lines, regardless of shippers' directions, or of the effect of diversions on the earnings of the individual units in the national system. The aim was to utilize every instrumentality of transportation to the highest degree of traffic-handling efficiency.

The results of Federal control during the year 1918 while the war was in progress were satisfactory in that they met the emergency. The traffic of that year, both in ton-miles and in passenger-miles, exceeded all previous records. What was more important, the coordination of railway management with other branches of the Government had the effect of producing the kind of transportation most necessary for war purposes. The congestion of the early winter of 1917 was quickly relieved. The heavy demands of troop movements were completely met. The loaded cars on hand at the seaboard were always a little ahead of the ocean-going tonnage capacity, and the railways, after May 1, kept up their part of the programme of moving export food supplies for the civilian population of the Allies. The insistent preference given to war traffic naturally entailed some curtailments in service for civilian population of the United States. These curtailments were patriotically accepted. A system of centralized control established priority for the various kinds of freight and controlled traffic at the source by requiring permits before freight would be accepted. Such permits were not issued unless transportation conditions at destination were such that the freight could be quickly unloaded. Manufacturers and dealers were asked to load cars with larger shipment units, or otherwise to conserve car space by changing methods of packing. One of the first acts of the director-general was to appoint a commission to make recommendations as to wage increases. The commission made its report in May and its recommendations were adopted and made retroactive to Jan. 1 1918. The increases in pay-roll expenditure were substantial. Coincident with the promulgation of the new wage scale, the director-general created the Board of Railway Wages and Working Conditions and later he appointed three Boards of Adjustment to pass upon disputes as to working rules and discipline. Both the wage and the adjustment boards were bi-partisan with equal representation from the officials, representing management, and from the execu-

tives of the labour organizations, representing the employees. During 1918 there were no strikes or other labour disturbances. The director-general was given almost autocratic authority to increase freight and passenger rates and other transportation charges or regulations. The Interstate Commerce Commission and the state commissions temporarily were shorn of power. An increase of 25% in freight rates and about 20% in passenger rates was made effective in June, a few days after the wage increases were announced. While in a general way it was hoped that the advances in rates, coupled with the expected economies in unified control, would offset the higher wage rates and other increases in operating costs, the net financial results were regarded as of secondary importance as compared with the increase of transportation capacity. The rate advances were insufficient to meet rising costs and the final result of the first year of Federal control, with no allowances for deficiencies in maintenance or depletion in stocks of materials and supplies, was a deficit of over \$200,000,000. In other words, the net operating income earned by the director-general was that much less than the rentals paid to the railway companies. This deficit, however, may properly be regarded as one item of the cost of carrying on the war. In view of the satisfactory transportation service, particularly during the summer of 1918 when the armies of the United States were at the height of their activities, and comparing the deficit with the expenditures of other branches of the Government, the cost was not great.

The second phase of Federal control was the period from the signing of the Armistice in Nov. 1918, until March 1 1920, when the roads were returned to private management. This post-war period of Federal control was not marked by results as satisfactory as those of 1918. It would have been much better if the period of Federal control had ended Dec. 31 1918. Immediately after the Armistice the moral factor of patriotism, which had been so effective during the first ten months of Federal control, almost entirely disappeared. As soon as the war was over the employees through their organizations began a campaign to hold and to extend further the concessions which had been made freely under the exigencies of war; the thoughts of the officers began to turn to their corporate and personal interests; and among a minority of the administration officials active steps were taken to bring about an indefinite extension of Federal control with the ultimate aim of nationalization. The public, however, had little patience with the director-general's proposal to Congress that Federal control should be extended five years, and the suggestion had little support outside of the labour organizations and the political forces aligned on the side of nationalization. Chambers of commerce, shippers' organizations, and the general public, in the natural reaction against perpetuating war-time governmental control of business, insisted that the railways should be returned to private control. This general attitude toward the subject, and the alarming deficits which were being added to that of 1918, influenced Congress to take active steps to restore the railways to their pre-war status, but great difficulty was experienced in agreeing upon a plan which would be satisfactory in detail to both the House and the Senate. While the hearings and the debates dragged throughout the year 1919, the transportation service suffered in efficiency and among the more radically inclined employees there were frequent and serious strikes. It was found necessary to grant further increases in wages and to enter into the so-called "national agreements" containing many burdensome and restrictive rules such as, for example, the abolition of piece-work in shops. Most of these national agreements were made almost on the eve of the return of the railways. They were drawn by the labour advisors to the director-general and were adopted over the protest of the railway operating officials. These national agreements were partially abrogated July 1 1921, by order of the Railway Labor Board created by the Transportation Act of 1920.

The final cost to the Government for the 26 months of Federal control was estimated by the director-general at a minimum of \$1,200,000,000. It seemed probable that it would be much

greater, as this estimate allowed only about \$300,000,000 for under-maintenance and for differences in the quantities of materials and supplies on hand at the beginning and at the end of Federal control.

A great deal of controversy arose over the question of relative maintenance during and prior to Federal control, but the differences hinge mainly upon the degree of under-maintenance. There can be no doubt that the condition of the properties was not so good at the end of Federal control as at its beginning, but the exact degree of deterioration cannot be determined as no inspection or survey was made when Federal control began. The records show conclusively that the normal rate of renewals of rails, ties and ballast was not kept up during Federal control, and the universal complaint of the railway executives that freight cars were not maintained at normal standards is supported by the opinions of experts. On the whole, the conditions of locomotives did not suffer, but less than the normal amount of work was done on passenger cars. Bridges and buildings suffered because of neglect in painting, but on the other hand many improvements were made in shops and in engine-house facilities. Whatever may be the degree of under-maintenance it should be remembered that it was impracticable during the greater part of the period of Federal control to obtain the necessary amount of materials and full forces of men. These difficulties were partly removed in 1919, but in that year the serious decline in traffic and in earnings made it inexpedient, in the judgment of the director-general, to attempt to make up the deficiencies. A proviso in the contract between him and the railway companies gave the director-general the option of measuring his maintenance obligations by the amounts actually spent by each company during the three years prior to Federal control, these amounts to be properly equated to allow for increases in the cost of wages and materials, and he chose to limit the expenditures so as to keep them within that obligation, leaving the accounting and the settlement to be worked out after the termination of Federal control. Instructions were issued, however, that nothing essential to safety in operation was to be left undone. An inspection of the amounts spent for maintenance, particularly for maintenance of equipment, indicates that even with a generous allowance for the higher wage rates and material costs, the director-general expended amounts which were equivalent to those spent by the railway companies prior to Federal control. This method of comparison, however, takes no account of the important factor of relative efficiency of labour. During 1918, when so many railway men were drafted or had volunteered for military service, the percentage of inexperienced employees was abnormally large, and during 1919 the general lowering of the morale and the frequent strikes of men engaged in maintenance work led to a much lower degree of efficiency. The director-general held to the view that the Federal Control Act and the standard contract based upon it did not require him to take account of relative efficiency—that his obligation ended when he had expended an amount equivalent, when properly equated for the higher wage rates, to that spent in the test period. The railway companies on the other hand insisted that if in the test period 100 man-hours cost \$30 and produced 10 units of work, and if during the year 1919 the same number of man-hours cost \$60 but produced, say, 8 units of work instead of 10, the spirit of the Act is not followed unless the director-general spent enough in excess of \$60 to produce 10 units of work. This is the real point of difference. In the settlements made since the termination of Federal control this issue has been avoided by a policy of compromise and by lump-sum adjustments in which maintenance is but one factor, but it is probable that some of the companies which have large claims for under-maintenance pending may prefer to take the case to the courts for decision.

Too much emphasis, however, should not be placed upon the financial results of Federal control. Deficits might have been reduced or entirely avoided, and a surplus laid aside for the settlement of claims, if the 1918 advances in rates had been greater or if supplementary advances had been made in 1919 to take

care of the further wage increases granted in that year. The attitude of the administration was that it made little difference whether the higher operating costs were met indirectly through taxes or were directly collected from shippers and passengers in higher rates. As between the two alternatives the administration chose the first on the ground that another rate advance would have a serious effect upon the already much disturbed business conditions, and would be made the excuse for further profiteering. Speaking in general terms it may be said that the policy of the Government in taking the railways and operating them while the war was in progress was vindicated by the favourable operating results which flowed from a centralized and unified control. On the other hand it may be said that the experience of the post-war period of Federal control was not such as to justify a peace-time policy of Government operation or ownership under a democratic form of Government which relies upon the free play of the forces of competition. The unfavourable reaction of public opinion may be traced primarily to the elimination of competition in service. The railways were finally returned in response to an overwhelming public demand that private operation be restored, and almost immediately after its restoration, the desire for competitive service caused the abandonment of practically all the innovations of unification under Government control and operation.

*The Transportation (Esch-Cummins) Act of 1920.*—The conditions under which the railways were returned, and the policies of public regulation as they existed in 1921 were fixed by the Transportation Act of Feb. 1920, amending the original (1887) Act to Regulate Commerce. Besides providing for the restoration of operating control to the owning companies the Act provided that during the first six months, the so-called transition period, while railway rates and wages were in process of further upward revision, the Government would continue the guaranteed rentals paid during the period of Federal control. A Railroad Labor Board was created to pass upon wage matters, and made substantial increases in July 1920. The Interstate Commerce Commission was instructed to establish rates so that on the basis of current costs and under honest, economical and efficient operation, they would yield net operating income sufficient to pay a fair rate of return upon the value of the railway properties held for and used in the service of transportation. For the first two years the fair rate of return was set at 5½%, with an extra 0.5% (6% in all) to make provision for improvements chargeable to capital accounts. This mandate to the Commission, however, applied to the railways as a whole, or as a whole in territorial groups. For the purposes of the Act the Commission later divided the railways into three general groups, the eastern, the western and the southern. The mandate did not apply to individual roads in a group. Obviously a rate scale which will yield 6% to all of the railways in a group will yield more than 6% to some and less than 6% to others. No relief is provided for the railways which earn less than 6%, but when more than 6% is earned by a railway, the excess is to be evenly divided with the Government. The railway is to hold its proportion of such excess in a reserve fund and the one-half which goes to the Government is to be held by it as a general railroad contingent fund to be administered by the Commission in assisting the weak roads by loans. The reserve fund created by a railway from its excess earnings is to be held for interest charges or dividends in lean years, but whenever that fund is more than 5% of its property value, the excess over 5% may be used for any lawful purpose.

The problem of the weak railway has been for many years the principal obstacle in the path of a satisfactory solution of the railway question. In the determination of competitive rates, for example, a scale which will give a reasonable return upon the value of a weak railway will give too much to the strong railway. Conversely, when the scale gives a reasonable return, but not more, to the strong railway, the weak one cannot live. In practice the regulating authorities have been forced to adopt a middle ground with, perhaps, a tendency to lean more toward preventing an unreasonably high return to the strong than an unreasonably low return to the weak. An attempt has been made to meet this problem in the Transportation Act which provides for the ultimate elimination of the weak railways by consolidation with the strong. The Commission is ordered to prepare and adopt a plan for the consolidation of railway properties into a limited number of systems. Such a plan is to preserve a reasonable degree of competition and to maintain so far as practicable the existing routes and channels of trade and commerce. The desiderata are that the several systems shall be so arranged that the cost of transportation as between competing systems, and as related to the values of the properties, shall be approximately the same, so that these systems can employ uniform rates in the movement of competitive traffic, and can earn, under honest and efficient management, substantially the same rate of return upon the value of their respective properties. The Commission in June 1921 was engaged upon the formulation of such a plan, but as the Act pro-

vided no way in which its recommendations might be enforced when objections were raised against its terms, there seemed likely to be long-drawn-out controversy and additional legislation before an ideal scheme of consolidation into a small number of systems of fairly equal financial strength would be made effective. The new Act enlarges the powers of the Commission over financial management and requires it to exercise a general supervision over all new issues of securities. The Railway Labour Board (consisting of nine members divided equally among representatives of management, labour and the public) is empowered to fix wages and working rules.

The foregoing outline mentions most of the important new features in the 1920 legislation amending the original Act to Regulate Commerce and the amendments up to 1920. The fundamental provisions of the original Act remained in force in 1921 and had been extended or otherwise strengthened. Briefly, the Commission is required to see that rates and charges are just and reasonable; to prescribe the rules under which rates may become effective; to prevent unfair discriminations between shippers, carriers or localities; to prevent, except when specifically authorized, the charging of a higher rate for a short haul than for a longer haul over the same route in the same direction; to prevent the pooling of freight or earnings; to require complete reports from carriers in prescribed form; and to prescribe and enforce uniform rules for accounting and for compilation of statistics of operation.

In addition to the Federal legislation just described, each state exercises its powers of regulating intrastate traffic and of exercising what may be termed "police powers" over railway management and service within its own borders. The line between Federal and State regulation is not clearly drawn, and controversies between the two authorities have been frequent. On the whole, the tendency of court decisions during the decade 1910-20 was toward according greater powers to the Federal commission and less power to the State commissions, as it has been shown that the states, when exercising control over intrastate rates and service, may indirectly discriminate against interstate traffic and service.

In addition to the changes in the Act to regulate commerce, new legislation was enacted during the decade which strengthened and extended the laws pertaining to safety appliances and accident prevention. These laws govern certain features of design and maintenance of locomotives and cars and of operating methods in train service. For example, the use of high-power headlights has been made compulsory, and the requirements as to boiler inspection and the general condition of locomotives have been made more rigid. The scope of the laws governing maximum hours of service was enlarged. The eight-hour basic day, prescribed for train service employees by the Adamson Act, passed by Congress in 1916, was extended during the period of Federal control to apply to practically all classes of railroad employees.

**Statistics.**—The salient features of mileage, investment, income and transportation production in ton-miles and passenger-miles, are shown in Table I, compiled by the Bureau of Railway Economics, Washington, D.C., under date of March 21 1921. The figures apply only to Class I. railways, i.e. those which have operating revenues in excess of \$1,000,000 per year. These railways comprise about 92% of the total main-track m., about 95% of the total capitalization, and they earn about 97% of the total operating revenues.

In interpreting the figures in Table I, it is necessary to bear in mind that the results of 1917-20 were very much affected by war conditions and by Federal operation of railways from Jan. 1 1918 until March 1 1920. The period was one of abnormally high operating expenses and of greatly diminished net income, notwithstanding the large operating revenues. Obviously a continuation of the low income of 1919 and 1920 would cause universal railway bankruptcy. The aim of the Transportation Act of 1920 was to restore the pre-war earning power, to enable the railways to give better service, and to provide revenues which with reestablished credit would permit expansion and improvements in facilities and equipment.

**Details for 1917.**—Instead of figures for a later year, those of 1917 are selected to give an indication of the normal characteristics—financial, operating and public service of American railways.

On Dec. 31 1917 the total route mileage of railways of all classes was 253,626 miles. This was equivalent to 8.53 m. of railway for each 100 sq. m. of territory, or 24.39 m. for each 10,000 inhabitants. The relation of route mileage to track mileage (for Class I. roads only) is shown in Table II.—

TABLE II. ROUTE AND TRACK MILEAGE. CLASS I. ROADS, DEC. 31 1917

Item	Miles	Per cent. of route miles
First main track (route m.)	232,697	100.0
Second main track	29,913	12.9
Third main track	2,775	1.2
All other main tracks	2,190	0.9
Yard tracks and sidings	101,108	43.5
Total all tracks	368,683	158.5

The total route m. for railways of all classes in 1917 was owned by 1,874 separate companies. Of these, 186 were railways of Class I.

with route mileage as shown in Table II., made up of 178,707 m. owned and 53,990 route m. operated under lease or similar arrangement. The average route mileage operated per Class I. road was 1,251 miles. For railways of Classes II. (those with operating revenue \$100,000 to \$1,000,000 per year) and III. (those with operating revenues below \$100,000 per year, including switching and terminal railways) the average was 44 miles. The greater part of the mileage owned by the large number of small companies is leased to and operated by Class I. roads.

**Finances.**—The total railway capital outstanding Dec. 31 1917 was \$21,249,357,241. This, however, included certain duplications in securities of one company held by another company and used by the second company as the basis for additional securities. Eliminating the intercorporate holdings and other duplications, the net capitalization on that date was \$16,401,786,017, or \$66,699 per route mile. Of this net capitalization, \$39,930 per route m., or 59.9% of the total, was in capital stock, and \$26,769, or 40.1% of the total, was in bonds or other forms of funded debt. In that year the average dividend paid on all stock was 4.24%, but no dividends whatever were paid on 36.7% of the stock. The average dividend rate on the dividend paying stock alone was 6.81 per cent. The average rate of interest paid upon funded debt may be estimated as about 4 per cent. The number of stockholders was approximately 670,000 and the number of bondholders about 300,000.

Table III. gives the income account of all railways considered as one system, including switching and terminal companies, for the year ended Dec. 31 1917.—

TABLE III. INCOME ACCOUNT, ALL RAILWAYS, 1917

Railway operating revenues	\$4,178,784,652
Railway operating expenses	2,956,770,809
Net revenue from railway operations	1,222,013,843
Railway tax accruals	227,301,093
Uncollectable railway revenues	711,879
Railway operating income	994,000,871
Equipment and joint facility rents (net deduction)	26,573,773
Net railway operating income	967,427,098
Other income (non-operating)	101,808,148
Gross income	1,069,235,246
Net interest charges	475,646,748
Other deductions from gross income	24,371,700
Net income	569,216,798
Net dividends (including dividend appropriations from surplus)	293,291,805
Income above dividends	275,924,993

Of the total operating revenues about 70% came from the transportation of freight and about 25% from passenger-train service including mail and express. The remaining 5% was miscellaneous operating revenue. The operating expenses were divided as follows: maintenance of way and structures, 15.6%; maintenance of equipment, 24.2%; traffic (solicitation, advertising, etc.), 2.3%; transportation (operation of stations, yards, terminals and trains), 53.6%; general expenses, 3.4%; and miscellaneous, 0.9%.

On Dec. 31 1917 the equipment owned by railways of all classes was as follows:—

Steam locomotives	65,699
Other locomotives	371
Freight train cars	2,408,518
Passenger train cars	55,939
Company service cars	103,916
Steamboats and tugboats	411
Barges, car-floats and canal boats	1,868
Other floating equipment	163

The item "other locomotives" is made up almost entirely of electric locomotives. "Freight train cars" do not include private freight cars (numbering about 80,000) owned by meat-packers, oil companies and similar industrial concerns. "Passenger train cars" do not include parlour and sleeping cars owned by the Pullman Co., of which there were 7,706. "Company service cars" include ballast cars, construction cars, wrecking cranes, etc.

The average number of employees during the year 1917 for all railways was 1,833,732. For Class I. railways only, the number was 1,732,876, divided as follows:—

Class	Number	Percentage
General and divisional officers	18,446	1.1
Clerks, messengers and attendants	192,569	11.1
Maintenance of way employees	448,720	25.9
Maintenance of equipment employees	388,837	22.4
Traffic department employees	8,333	.5
Dispatchers and telegraphers	67,455	3.9
Station employees	132,562	7.6
Yard and engine-house employees	183,877	10.6
Train-service employees	226,936	13.1
All other employees	65,141	3.8
Total	1,732,876	100.0

TABLE I. MILEAGE, INVESTMENT, REVENUES, EXPENSES, 1911-20. INCLUSIVE, OF CLASS I. RAILWAYS

	Fiscal Years ended June 30.					Calendar Years ended December 31.				
	1911	1913	1914	1915	1916	1916	1917	1918	1919	1920
Miles of track operated — main track	244,300.77	254,821.20	259,139.53	262,424.88	264,920.40	265,802.97	267,574.12	269,174.54	270,556.62	*
Property investment — Class I. roads and their non-operating subsidiaries (investment in road & equipment, exclusive of materials and supplies)	\$14,246,167.47	\$15,284,763.48	\$15,842,127.27	\$16,257,146.63	\$16,688,440.05	\$16,884,440.03	\$17,762,152.127	\$18,213,629.613	\$18,474,197.914	*
Total operating revenues	2,752,497.297	3,108,361.215	3,031,326.963	2,871,563.047	3,381,597.866	3,596,865.766	4,014,142.748	4,880,953.480	5,143,589.998	56,171,493.301
Total operating expenses	1,902,994.333	2,173,463.563	2,203,423.812	2,021,166.614	2,210,892.786	2,337,398.412	2,829,325.124	3,982,068.197	4,398,408.414	5,708,720.013

\*Not available in 1921. *a* Total operating revenues for 1920 includes approximately \$55,000,000 of back mail pay collected in 1920 but applicable to services rendered in 1918 and 1919. *b* Computed on investment of 1919.

Note: Net Railway operating income as shown above for 1918, 1919, and 1920 represents the actual earnings from operation of the Class I. railways. The "standard return" for these roads (i.e. the net operating income after collecting rental from the U.S. Government) amounted to approximately \$89,500,309 for the years 1918 and 1919, and for 1920 amounted to approximately \$82,500,000, taking into account two months of Government operation, six months of Government guarantee and four months of private operation.

The subsequent application, during Federal control of the eight-hour day (instead of the former basis of 10 hours for a large proportion of employees) to practically all of the classified employees had the effect of increasing the number of men required to do a given number of hours of work. At the end of Federal control the total was about 2,000,000 employees, not including conductors and porters on Pullman cars employed by the Pullman Company.

**Construction and Equipment.**—The tendency in the decade 1910-20 was toward the use of heavier rails. On heavy traffic lines, using the most powerful locomotives, rails weighing 100 lb. per yd. were being replaced by rails, weighing 105 to 110 lb. On other lines which had used 85-lb. rails the tendency was toward 100-lb. rails. Greater attention was paid to the relative proportions of the chemical elements in steel and the mills were turning out rails of improved design and of greater strength and wearing qualities. The marked development in the weight of locomotives and cars placed much greater strains on the track superstructure and roadbed. In 1921 American Railway Engineering Association standards for depth of ballast had not been changed recently, but some of the heavy traffic roads were increasing the amount of ballast from 12 in. to 20 in. below the ties. The experiments in the use of steel and concrete ties as substitutes for wood ties (sleepers) had not given satisfactory results under the heavy axle loads of American equipment, and there was little inclination to use substitutes for wood, notwithstanding the marked depletion of the lumber supply. There was, however, a more general use of preservatives in treating ties chemically to strengthen their resistance to decay, and a more general use of tie plates, between the base of the rail and the top of the tie, to lessen the mechanical wear on the tie. The screw spike, in place of the cut spike, for fastening the rails to the ties, was having greater use, but was not common. The heavier axle loads required a general strengthening of bridges, and throughout the whole field of maintenance engineering the adoption of higher standards during the decade was noticeable.

There was a marked development in the art of signalling. The use of electrically controlled automatic block signals is distinctively an American characteristic. There was a steady tendency to substitute automatic block signals for the older type which are manually operated. In 1911 there were about 29,000 m. of main track equipped with automatic block signals. In 1920 the mileage so equipped was over 61,000 miles. The use of these modern signals not only increases the safety of train operation but it also has the effect of increasing the capacity per mile. In the interest of safety there was a popular demand that block signalling should be made compulsory by law, and the Interstate Commerce Commission has repeatedly recommended legislation which would require the railways to adopt an annual programme under which all railways would eventually be completely equipped with block signals. Congress, however, had not by Jan. 1921 legislated on the subject, mainly because of the difficulty of formulating a plan which would fit the varying needs of roads with differing degrees of traffic density, and because of the heavy financial burden which compulsory block signalling would place upon the railways. There was also a widespread demand for the adoption of a device of some kind which would automatically stop the train when the engineman failed to observe the signal and ran past one which was in the stop position, but Congress appears to take the position that it is more important first to extend the installation of block signals before insisting upon the expensive supplementary safeguard of the automatic stop.

In 1910 the average weight of all locomotives, exclusive of tender, was about 73 short tons. In 1920 it was about 90 short tons. The tendency was steadily toward the use of more powerful locomotives and the retirement of the lighter types. The locomotives ordered in 1920 weigh from 100 to 200 tons, with a few of the Mallet compound type of much greater weight. The use of steel passenger cars calls for larger locomotives in that class of service, and the American policy, consistently followed for years, of increasing the freight-train load, required the use of more powerful locomotives in freight service. The average freight-train load, in tons of freight, grew from less than 400 tons in 1910 to more than 700 tons in 1920. Not all of this increase is to be attributed to the heavier locomotive. Reductions in grades and curvature have made heavier trains possible. There was also a general improvement in the technique of tonnage ratings for locomotives. In addition there was a more general use of the superheater on locomotives. This device reduced the loss in steam pressure between the boiler and the cylinder and increased the drawbar pull. The use of automatic stokers on the most modern type of freight locomotive removed one limiting point: the capacity of the fireman in shovelling coal into the fire box. A recent device for increasing locomotive capacity is known as the "booster." It is a small auxiliary engine geared to the trailing axle (on locomotives which have a pair of wheels not connected with the main drivers) and may be used in starting the train or in giving an extra drawbar pull on the limiting grades.

While not so marked as in the case of the locomotive, there has been a steady increase in the weight and capacity of freight cars, particularly in those designed to carry coal, ore, or steel or iron products. The standard coal car of 1921 had a capacity of 100,000 lb., and in some cases cars of double that capacity were used locally on the owning road in coal or ore traffic. There was no appreciable

increase in the capacity of box cars as the commercial standards do not call for larger units than 60,000 to 80,000 lb. per car.

Reference has already been made to the more general use of steel in passenger-car construction. Virtually no new wooden cars were built for passenger service after 1915. On Jan. 1 1911 the passenger-train equipment consisted of 50,201 wooden cars, 1,636 of steel underframe construction, and 3,133 of all-steel construction. On Jan. 1 1919 the numbers were: wood, 36,810; steel underframe, 8,805; all-steel, 18,652. The use of the old wooden cars was generally confined to local trains and branch lines.

**Accidents.**—A comparison of the latest available complete accident statistics (in *Bulletin 74, Interstate Commerce Commission*, published in Nov. 1920) with the statistics for 1907 and 1908 (see 22.832) indicate a gratifying improvement. The casualties in 1919 were less than those of 1907 or 1908, notwithstanding the fact that the volume of traffic in 1919 was nearly double that of 1907. The improvement may be attributed to several factors, but it is difficult to list them in the order of their importance as the influence of any one factor cannot be measured separately. Among them are (1) higher standards of construction and maintenance of way, structures and equipment; (2) enforcement of laws relating to safety appliances, boiler inspection, and hours of service; (3) extension of block signalling; (4) other improvements in operating methods; (5) the psychological effect of the "Safety First" movement, begun about 1910 (a nation-wide movement to interest railway employees in accident prevention); and (6) the publication of results of investigations made by the Interstate Commerce Commission in specific accidents. The data contained in the appended table were taken from *Bulletin 74*.

CASUALTIES TO PERSONS IN TRAIN ACCIDENTS AND TRAIN SERVICE ACCIDENTS

Item	1919		1918		1917	
	Killed	Injured	Killed	Injured	Killed	Injured
<b>Passengers:—</b>						
In train accidents	110	4,549	286	4,655	131	4,460
Total passengers	101	3,598	233	3,427	212	3,914
<b>Employees on duty:—</b>						
In train accidents	301	8,147	519	8,082	343	8,374
Total employees on duty	1,334	33,325	2,212	42,782	2,177	48,022
<b>Employees not on duty:—Total</b>	1,693	36,280	2,759	46,961	2,616	52,236
<b>Other persons, not trespassing:—</b>						
In train accidents	66	321	169	595	165	544
Total other persons	9	61	117	433	109	473
<b>Trespassers:—</b>						
In train accidents	1,873	5,134	1,878	5,268	2,091	5,514
Total trespassers	1,882	5,195	1,995	5,701	2,200	5,987
<b>Grand Total</b>	3,221	92,604	5,260	101,141	5,156	107,970

\*Includes persons struck by trains at highway crossings.

The analysis of train accidents in 1919 shows that the total number was 25,596, divided as follows:—collisions, 6,904; derailments, 15,897; locomotive accidents, 674; and miscellaneous, 2,121. These figures include all train accidents, with and without personal injury. Collisions caused the death of 238 persons and the injury of 3,931. The casualties in derailments were 175 deaths and 2,979 injuries. The casualties in locomotive and miscellaneous accidents were relatively few. (W. J. C.)

**RAILWAY STATIONS.**—The improvements made during the decade 1910-20, especially in the United States, in the construction and operation of railway passenger stations, may be said to have revolutionized railway terminal construction; and the newer stations, of which the Grand Central terminal in New York is the outstanding example, demonstrated even after a short period of operation their superiority from practically every point of view. The substitution of electricity for steam as a motive power was the basic factor in the newer methods of construction. As long as steam was used little could be done to mitigate the noise or noxious gases that made the old-fashioned railway yard a public nuisance. It was virtually necessary to operate these yards on the surface where the products of combustion could make a free escape to the open air. In any confined space steam operation is not only dangerous, owing to the tendency of smoke to obscure the signals, but unpleasant for pas-

sengers. The use of electricity eliminates the noxious gases and reduces the noise of the locomotive. An electrified yard can be depressed and completely covered over. This permits the reclamation of streets and valuable areas hitherto obstructed by tracks, with the result that what was formerly a railway yard filled with steam and smoke can be utilized for public and private buildings of the finest character.

In Europe, the completion of the passenger station at Leipzig (1915) was practically the only terminal improvement that was not interrupted by the World War, although the Gare St. Lazare in Paris was somewhat enlarged, and in London, Waterloo station was partly reconstructed and a number of tracks equipped for electric operation. The Leipzig station was under construction from 1907 to 1915, and cost £8,500,000, of which, following the German practice, £2,900,000 was borne by Saxony, £2,550,000 by Prussia, £810,000 by the city of Leipzig and £240,000 by the imperial Post Office Department. The main building has a frontage of 984 ft. and occupies an area of 172,000 sq. feet. The train shed has a high roof of steel and glass, built in the form of six arches; it is 785 ft. long, with an area of 710,500 sq. ft., and covers 26 tracks. The station serves as a junction for the passenger traffic of Magdeburg, Thuringia and Dresden, and the larger part of the traffic between Prussia and Saxony passes through it.

At the close of the decade the Leipzig station was the largest, though not the busiest, station in Europe. It was smaller than the Grand Central and Pennsylvania stations in New York, and was in 1920 handling considerably less than half as much traffic as the Gare St. Lazare, the busiest station in the world. It was said in 1916 that the number of persons passing through the St. Lazare in a single month equalled the total number of soldiers fighting on all fronts. Plans were then undertaken to electrify the suburban traffic, which is very heavy, and to depress the suburban tracks to a level beneath the steam trains. Even without these increased facilities, the station furnished accommodations for 200,000 to 250,000 passengers a day, a record, however, very nearly equalled in London by Liverpool St. station. Both the Gare St. Lazare and Liverpool St. station handled on busy days twice as much traffic as the South station in Boston, the busiest American station.

TABLE I. *Largest Railway Stations.*

Station	Ac.	No. of Tracks	Trains per day	Passengers per day
Grand Central, N.Y.	80	67	600	110,000
Pennsylvania, N.Y.	28	21	500	75,000
Leipzig	20	26	400	—
St. Lazare, Paris	12	31	1,700	200,000
Liverpool St., London	10	20	1,500	175,000
Waterloo, London	9	18	1,100	100,000
South, Boston	10	28	1,000	125,000
Kansas City	18	18	400	65,000
Northwestern, Chicago	8	16	450	70,000

Outside of Europe and North America two important stations were erected, one in Argentina and one in Japan. The Retiro station of the Central Argentine railway at Buenos Aires, said to be the finest station in South America, was opened in the latter part of 1915. The terminal, including buildings, train sheds and approaches, occupies 744,000 sq. ft., and in point of size and design compares with any of the newer stations elsewhere. Much of its equipment was supplied by English contractors. The Central Railway station in Tokyo, completed in 1915, was erected at the very small cost of £270,000, although it is built on a scale which in the West would cost 10 or 20 times as much. The explanation lies in the extremely low price paid for Japanese labour, 10d. (\$.20) a day (of 10 to 12 hours) for common labourers, and £5 a month for carpenters and masons. Estimated in days' labour, the cost was 730,000 labourer-days. The main building is of brick and granite, 1,104 ft. long, 66 to 132 ft. wide and 54 ft. high, with a dome (152 ft.) at either end. The terminal took the place of three stations which formerly served the three main-line Government railways.

In the United States and Canada a constantly increasing railway traffic made necessary the construction of a large num-

ber of new stations. Terminals that had been erected with the expectation that they would serve their purpose for 50 years or longer became inadequate in less than half that time. The result was that the newer stations were built on what would otherwise be considered too extravagant a scale. The designers were looking to the future.

One distinctively American contribution to the advance of terminal architecture was the invention of an improved roof to take the place of the great arched train shed, once considered the most necessary adjunct of a railway station. Cold in winter and hot in summer, these sheds were expensive to build and expensive to maintain. Even at the height of their popularity there were some designers who preferred the umbrella or butterfly types of shed, consisting of a series of low arches which, viewed in cross section, suggest the names by which they are known. After 1905 the Bush type of shed began to supersede all others, especially where steam was still tolerated in the terminal area. This shed was the invention of Lincoln Bush, who made the first installation at the Hoboken terminal of the Delaware, Lackawanna & Western railway, of which he was chief engineer. The Bush shed is similar to the butterfly and umbrella sheds; it differs principally in that it affords a continuous roof except for an overhead slot above the centre of each track for the escape of steam and gases from locomotives. A shed of this pattern affords protection from the weather, is free from smoke and dirt, and costs about one-half as much as the large arched shed. Within ten years after its invention the Bush shed had been adopted in 11 American and Canadian terminals, notably the Michigan Central station at Detroit, the Northwestern at Chicago, the Grand Trunk at Ottawa and the Canadian Pacific at Montreal. In England there was developed a somewhat different type known as the "ridge and furrow," of which the Snow Hill station of the Great Western railway at Birmingham, reconstructed in 1914, furnishes an example. The Snow Hill train shed consists of a series of transverse girders (275 ft. long with four supporting columns) spanning the entire width of the station. The best results, however, can be attained only where the smoke and dirt of steam operation are eliminated altogether. The problem of the train shed was most completely solved in the Grand Central terminal, New York, where electricity was adopted as a motive power. Here the "sheds" closely resemble the stations on a subway or underground railway.

Less successful in this respect, though of first-rate importance among the new stations of the period, was the Pennsylvania station in New York. Being of the so-called through-station type, this station is essentially a monumental bridge over the tracks, which traverse Manhattan Island in tunnels under the city. The main building was designed after the Roman Doric style of architecture and occupies two complete blocks (8 ac.), on Seventh Avenue from 31st to 33rd Streets. The general waiting-room is 277 ft. by 103 ft., with a height of 150 feet. The train yard or shed (340 ft. by 210 ft.) is an "undisguised example of modern engineering in glass and iron," and suggests somewhat the old-fashioned train shed. The station was built primarily to provide the Pennsylvania railway with a terminus in New York (before 1910 the terminus was in Jersey City), and the construction of the river tunnels, which were necessary to make a connexion with Manhattan Island, was an engineering feat of considerable magnitude. The improvement extends from Manhattan Transfer, 1 m. east of Newark (about 7½ m. from the terminal), to a connexion with the Long Island railroad at Woodside, L.I., which also used the Pennsylvania station as a terminus. At Manhattan Transfer incoming Pennsylvania trains change to electric operation and are hauled by electric locomotive, operating with a direct current of 600 volts from a third rail. At the New Jersey shore they descend into one of the two approach tunnels and proceed under the Hudson river and New York to the Pennsylvania station. As soon as empty they leave the station to the east, still travelling underground in one of four tunnels which pass under eastern Manhattan and the East river to Long

Island, where they emerge not far from the railway yards. The terminal was completed in 1910 at a cost of \$115,000,000.

The Grand Central terminal, undoubtedly the most successful modern terminal of any type, was begun in 1903 and opened to the public in 1912. The primary purpose was to provide not only the necessary traffic facilities for an enormous number of passengers—ultimately expected to reach at least 250,000 a day—but to ensure pleasant and comfortable accommodations for every passenger, even at times when the crowds were heaviest. Subsequent development of the terminal area has made the Grand Central terminal not merely a railway station but a civic "center" of impressive beauty and utility. A railway station should form a harmonious unit in the architectural development of the city, but the designers of the Grand Central terminal accomplished something more than that: they actually transformed the architectural aspect of a very considerable section of New York. They achieved this result partly by setting a high standard themselves and partly by causing practically every property owner and builder within that section to measure up to it. The achievement was the more remarkable in that the entire project was conceived and carried out by the New York Central lines, a private corporation, without assistance of the city or state. The extraordinary architectural and economic success of this terminal was largely due to the intensive utilization of areas immediately adjoining the tracks and even over the tracks themselves—areas that were formerly incapable of being used or were suitable only for cheap dwellings or certain kinds of factories. Early plans did not contemplate buildings of a greater height than six stories in the immediate terminal area, but as soon as it was evident that noise, smoke and dirt had been successfully eliminated there arose a demand for hotels and office and apartment buildings of 25 and even 30 stories. This development was favoured by the fact that in constructing the terminal the engineers were able to restore to public use a number of streets that had hitherto been entirely done away with or existed only as foot bridges. The underground areas, yards, etc., occupy about 80 ac., which above the surface are covered with a great variety of buildings. It was not long before the enormous expenditure on the terminal, about \$150,000,000, came to be economically justified by reason of the high return obtained from the lease of the space over the yards, etc., for building purposes, the so-called "air rights." In 1920 this return was sufficient to meet the fixed charges on the entire investment. The problem of building the station was extraordinarily complicated, and the closest coördination between the operating and engineering departments was necessary to carry out the new construction while tearing down the old station and at the same time keeping in operation some 800 trains a day, including those run for construction purposes. There were excavated 3,250,000 cub. yds. of material (more than two-thirds of which was solid rock); and in the construction there were used about 1,000,000 bar. of cement; and all this work was performed without interruption to the service rendered the public. The architects, Reed & Stem and Warren & Wetmore, adopted a modified Doric style. The "head house," or station proper, is of monumental proportions and the façade (on 42nd St.) consists of three great portals designed to carry out the idea of a gateway. The exterior is granite and Indiana limestone. The main concourse, with a length of 275 ft. and a width of 120 ft., can accommodate 30,000 people at one time. Its great height (125 ft.) gives it an effect of unusual spaciousness. From the concourse the passenger walks directly out on the same level to the "express" platforms. In winter the main concourse is kept warm by indirect heating, and the station platforms are protected against inclement weather so that even on the coldest days the passenger can board his train in comfort. The tracks occupy two levels. The express level is 20 ft. below the level of the street (Park Ave.) and occupies 45.4 ac.; the suburban level is 44 ft. below the street and occupies 32.8 acres. There are 42 tracks on the upper level and 25 on the lower; a special waiting-room (the suburban concourse) gives access to the latter. Leading from the main concourse are connexions

with the incoming waiting-room (or station), the Commodore and Biltmore Hotels, the Yale Club, the Vanderbilt Concourse office building and various other buildings. The incoming waiting-room, located beneath the Biltmore Hotel, has separate passage-ways of its own leading to the concourse, the subways, the street, etc., so that passengers arriving in the terminal do not interfere with the flow of people to trains. The use of ramps, or inclined passage-ways, instead of stairways, facilitates the movement of passengers and lessens the danger of accident. Nearby hotels include the Belmont and Chatham.

A vital necessity in designing the Grand Central terminal was a signalling system for each level that could be operated by a director who could not possibly see the train movements which he controlled. Interlocking machinery, which in its simplest form is locking mechanism designed to control the signals so that they will automatically indicate the position in which the switch is set, was originated in England about 1856, but its use did not become general for many years. To operate the complicated network of trackage in a modern terminal requires interlocking machinery of an extremely elaborate character; the mechanism must safely control traffic and permit train movements with the greatest possible despatch. In the Grand Central terminal the interlocking machinery is of the all-electric type. Each track level is controlled by a director who is guided by a diagram on which the movement of trains is indicated by small electric lights. The largest of the signal machines is operated by 400 levers, each of which moves electrically a switch or signal, and to each 40 levers is assigned a man working under the instruction of the train director. The machinery is as nearly automatic as possible. Alternating-current track circuits are used to prevent the operation of switches while trains are moving over them and to indicate the presence of trains in proximity to danger zones. These circuits also operate electric locks which automatically hold the levers so that they cannot be moved except when the track is clear. Alternating current is used because of the 660-volt direct-current circuit employed for electric motive power. There are five main interlocking stations. The procedure in the case of an incoming train is as follows: At Harmon (33 m.) the steam locomotive is detached and an electric locomotive substituted. From Mott Haven Junction (5.3 m.) the train is announced to the director by telegraph or loud-speaking telephone (a telephone instrument with a horn similar to that of a gramophone instead of a receiver). After the train has passed 72d St. the director can trace its further progress by means of the electric buttons on his diagram, and he then decides upon which track to receive the train and gives his order to the levermen accordingly. When the incoming track is determined an announcement is made by means of the telautograph to various parts of the terminal. This instrument notifies the attendant at the incoming bulletin board and, in the case of through trains, serves to summon the station porters.

The Grand Central terminal was built by the New York Central lines under the direct supervision of W. H. Newman, then chairman of the board of directors. The terminal is owned 60% by the New York Central lines and 40% by the New York, New Haven & Hartford railway, and is used by both railways under a detailed operating agreement. In 1920 the traffic capacity of the station was far from being reached, yet more than 110,000 passengers used the station, arriving and departing on some 600 trains daily. Besides these there were every day from 50,000 to 100,000 people who passed in and out of the station without using the trains. Of the daily traffic about 65,000 were suburban passengers, and this kind of traffic was steadily increasing. From 1903, when the construction was begun, to 1920 the total passenger traffic very nearly trebled.

Reference to Table II. will indicate the more important new stations besides those already described. In addition to the terminals listed, two new stations of large proportions were planned for Chicago. One of these, the new Union station, was already under construction in 1921, while the designs for the other, the Illinois Central or 12th St. station, had been approved by the railway and by the city authorities.

TABLE II.—Representative Railway Stations erected 1907-22.

Station	Date completed	Dimensions: main building ft.	Cost*
Washington, D.C.	1907	663 x 211	\$120,000,000
Pennsylvania, N.Y.	1910	430 x 430	115,000,000
Northwestern, Chicago	1911	320 x 218	24,000,000
Grand Central, N.Y.	1912	673 x 301	150,000,000
Ottawa, Quebec	1912	281 x 141	—
Michigan Central, Detroit	1913	345 x 266	7,000,000
Kansas City	1914	510 x 150	55,000,000
Havana, Cuba	1914	240 x 70	—
Buenos Aires	1915	850 x 606	—
Tokyo	1915	1,104 (Frontage)	1,350,000
Leipzig	1915	984 "	32,500,000
St. Paul, Minn.	1922	315 x 220	20,000,000

\*Includes entire cost of terminal development.

Whether the expense of the more elaborate American terminals is justified in view of the limited profit obtained from passenger business is a question which gave rise to no little discussion. Estimates were made as to the number of miles of new track that could be laid with the money expended for terminals, and it was demonstrated in some instances that terminal charges were making serious inroads on passenger profits. "As showing what some railways are up against," said John A. Droege, general superintendent of the New York, New Haven & Hartford railway, writing in 1916, "it is worth noting that the New Haven has to pay 29 cents for each passenger it brings into the Grand Central terminal in New York."<sup>1</sup> The U. S. Interstate Commerce Commission, in its report in the Anthracite case (35 I.C.C. 270), under the head of "Unproductive Betterments," said: "The Pennsylvania has expended on its new passenger terminal properties in New York City approximately \$114,000,000. These properties are operated by the Pennsylvania Tunnel & Terminal railway company, and the operations result in a deficit each year. The deficit in the year ended June 30 1913 was \$2,087,000. . . . Thus the question is presented: Must the present effective freight rates of the Pennsylvania earn an annual return of 6% on the investment in these terminal properties? The record shows that \$47,000,000 of the expenditures in this property has been charged to profit and loss and to income of the Pennsylvania—that is, its past surplus income has already contributed \$47,000,000 to the cost of this property." In answer to such criticisms Samuel Rea, president of the Pennsylvania lines, stated in 1917 that in seven years the traffic of the Pennsylvania station had increased from 9,862,434 to 18,135,311 annually, and that if the probable period of its usefulness was considered it could not be regarded as an unproductive betterment. He pointed out also that had the Pennsylvania waited longer to purchase a site in Manhattan the prices would have become prohibitive. By leasing "air rights" and retail privileges within the station, the owners of the Grand Central terminal were able in 1920 to make an effective answer to criticisms of this sort. Following the example of the Grand Central, many railways sought to make their stations productive investments. Thus the Michigan Central constructed a seventeen-story office building in connexion with its station at Detroit, while the designers of the proposed Union station at Chicago, estimated to cost nearly \$100,000,000, altered their plans to provide for a huge office building over the head house and train shed.

Closely connected with the criticism of expense was the criticism on the score of excessive size. Ironical references were made to the "magnificent distances" which passengers were compelled to walk between the street and trains. Examples of the distance walked by passengers purchasing tickets and checking baggage were given as follows: South station, Boston, 1,100 ft.; Northwestern, Chicago, 940 ft. and 20 ft. climb; Pennsylvania, New York, 480 to 950 ft., depending on the entrance used; Grand Central, New York, 450 ft.; Union, Washington, 1,200 feet. It should be said, however, that space is required if immense crowds are to be handled, and a slight extra walk is a small price to pay for freedom from the discomfort of crowded passage-ways. Nevertheless there were some leading railway men who believed that future development would be in the direction of more and smaller terminals located at various parts of a city. One proposal was to construct a system of subways, making each stop a local Railway Terminal.

See J. A. Droege, *Passenger Terminals and Trains* (New York, 1916). (H. B. \*)

**RAINER, ARCHDUKE OF AUSTRIA** (1827-1913), noted as one of the most cultivated and liberal-minded members of the Austrian imperial house, was born on Jan. 11 1827. His father, also named Rainer, the seventh son of the Emperor Leopold II. and of his consort Maria Luisa of Spain, was born in Florence in 1783, and from 1818-48 was viceroy of the kingdom of Lombardo-Venetia; his mother was the Princess Elizabeth, sister of Charles Albert, King of Sardinia. After serving in the army, the Archduke Rainer was in 1857 placed at the head of the permanent Imperial Council organized in 1851, which stood immediately under the Emperor and had among its functions the preparation of laws, and his experience in this office convinced him that the transition to a constitutional form of government on a liberal and centralized basis was necessary. In 1860 he conducted the negotiations for a strengthened Imperial Council; in 1861 he became head of the Government as president of the council of ministers of the Liberal Schmerling administration. His name is associated with the promulgation of the charter of the Constitution of Feb. 26 1861. In the same year Rainer became curator of the Academy of Sciences, a position which he filled till his death. In July 1865, when politics had shifted from the basis of the 1861 Constitution, he laid down office, and retired from public affairs. In 1872 he was appointed to the supreme

<sup>1</sup> In 1921 36 cents (23 cents terminal entrance and 13 cents tollage), representing charges from Woodlawn (11 m.), not including cost of operation.

XXXII.—5

command of the newly established Austrian *Landwehr*, to the organization of which he devoted many years of work. He continued to take a keen interest in art and science. As patron of the Arts and Crafts Museum (1862-98), and as curator of the Academy of Sciences, he won a high reputation. He greatly furthered the general knowledge of antiquity by the purchase of the papyrus discovered at Fayum, which was called, after him, the "Rainer papyrus." He married in 1852 Marie Caroline, daughter of the Archduke Charles, the victor of Aspern. There were no children of the union. He died on Feb. 27 1913.

**RALEIGH, CECIL** (1836-1914), English actor and playwright, was born Jan. 27 1836. He was the son of Dr. John Fothergill Rowlands, and took the stage name of Raleigh. He played for a time in musical comedy, but deserted acting for playwriting and, either alone or in collaboration, produced an immense number of melodramas, staged at first chiefly at the Comedy theatre, London, and in later years at Drury Lane. *Cheer, Boys, Cheer* (1895); *Hearts are Trumps* (1899); *The Best of Friends* (1902) and *The Whip* (1909-10) are typical examples. He also acted as dramatic critic to two or three London papers, and became secretary to the School of Dramatic Art in Gower St., London. He died in London Nov. 10 1914.

**RALEIGH, SIR WALTER** (1861- ), English man of letters, was born Sept. 6 1861 in London, and was educated at University College, London, and King's College, Cambridge. He was professor of modern literature at University College, Liverpool, and professor of English literature at Glasgow, and in 1904 was appointed professor of English literature at Oxford. He was knighted in 1911 and elected to a fellowship at Merton College in 1914. His publications include *The English Novel* (1894); *The English Voyagers* (1904); *Six Essays on Johnson* (1910); *Romance* (1917) and many essays on literary subjects.

**RAMPOLLA, COUNT MARIANO DEL TINDARO** (1843-1913), Italian cardinal (see 22.877). When Pius X. was elected Pope, Cardinal Rampolla resigned all his appointments, retiring into the background. He had always been filled with a high sense of the dignity of his office, and while secretary of state had entertained in princely style; but personally he was a man of austere habits, and after his retirement he led the simplest life. A sound scholar, he devoted his last years to study, particularly to hagiography and Christian archaeology. He died in Rome Dec. 17 1913.

**RAMSAY, GEORGE GILBERT** (1839-1921), British classical scholar, was born at Fontainebleau July 19 1839, the third son of Sir George Ramsay of Banff and a member of a well-known family of scholars. He was educated at Rugby and Trinity College, Oxford, where he graduated first-class in *Literae Humaniores* (1861). He then became assistant to his uncle William Ramsay, professor of Humanity at Glasgow, and succeeded him in 1863, occupying the chair until 1906 and becoming a great teaching force in defence of a classical education. He was the first president of the Classical Association of Scotland which he helped to found. He was also a keen politician and a considerable athlete. His published work includes a *Manual of Latin Composition* (3 vols., 1st ed. 1884, 4th ed. 1897); an annotated version of *The Annals of Tacitus* (2 vols. 1904-0) and of the *Historiae* (1915), as well as translations of Juvenal and Persius for the Loeb Library. He died at St. Andrew's March 8 1921.

**RAMSAY, SIR WILLIAM** (1852-1916), British chemist (see 22.880), died at High Wycombe July 23 1916. In 1904 he was awarded the Nobel prize, and in 1911 was president of the British Association. In 1913 he resigned his professorship of chemistry at University College, London. After his death a fund amounting to £53,772 was raised to perpetuate his memory by providing a laboratory of chemical engineering in connexion with University College, London, and founding Ramsay Memorial research fellowships of £300 a year each, tenable in any university in the United Kingdom for the advancement of chemical science.

**RAMSAY, SIR WILLIAM MITCHELL** (1851- ), British archaeologist (see 22.880), resigned his professorship at Aberdeen

in 1911, and subsequently published *The Imperial Peace and The Teaching of Paul in Terms of the Present Day* (1913); *Recent Research and the New Testament* (1914); *The Making of a University* (1915) and the *Life and Letters of William Black* (1918).

**RANDEGGER, ALBERTO** (1832-1911), musical composer and conductor, was born in Trieste April 13 1832. He settled in London in 1854 after holding various musical appointments in Italy. Both as an orchestral conductor, and as a teacher of music and singing he held for many years a leading position in London. Besides conducting on various occasions at the Royal Opera, musical festivals and elsewhere, he did much, as conductor of the Carl Rosa company from 1879, towards the popular revival of opera in England. He died in London Dec. 18 1911.

**RANGE-FINDERS AND POSITION-FINDERS** (see 22.888).—Recent improvements have rendered many of the earlier types of range-finders obsolete, and the following features are common to all modern coincidence range-finders. The range-finder usually consists of two main parts, viz.—a strong outer tube and an inner frame which supports the delicate telescopic system, any slight derangement of which would seriously upset the accuracy of the range-finder. The outer tube is made as strong and rigid as possible, having regard to the weight which can be allowed. The inner frame is supported in such a way that any slight bending of the outer tube will not affect it.

Some form of double end reflector is always used. This at one time consisted of a pentagonal prism, but large pentagonals are very costly; they absorb a good deal of light and are liable to slight distortion with changes of temperature. There is therefore a tendency to replace them by a combination of two silvered plane mirrors inclined to one another at  $45^\circ$ , and either fixed in a mount made of a metal having the same coefficient of expansion as glass, or rigidly attached to an upper and lower glass support, to prevent change in their relative positions.

The central reflectors usually take the form of two or more prisms balsamed together, and are known as the centre prism combination. Their object is to deflect the rays received through the two ends of the range-finder into the eye-piece, and to present the two images of the target in the field of view immediately above and below a thin separating line. Their construction is usually rather complicated. The fine separating line is as a rule obtained by means of a special separating prism; or by the edge of a silvered surface on one of the prisms, so arranged that the rays forming one image pass through the prism, and those forming the other image are reflected by the silvered surface.

The centre prism combination is also used for erecting or inverting the images, and for defining the limits of the fields of view received from each half of the range-finder. The arrangements of fields of view usually met with are the following:—

1. The field of view is divided into two equal halves and the images in both are erect. When a coincidence has been made, the separating line cuts straight through the image of the target. This system is used with naval and coast defence range-finders which have to deal with targets having long vertical features, e.g. masts and funnels. It is known as the "erect" system.
2. The field of view is divided into two parts by the separating line. One field (in field range-finders usually the lower) is erect, and the other one is a replica of it, being inverted up for down but not right for left. With this system it is much easier to make an accurate coincidence on small targets, but it has the slight drawback that the total actual field of view is necessarily considerably smaller than with the erect system, and a slight elevation or depression of the range-finder may cause the target to pass the separating line and disappear. This, however, is not of much importance if the target is a stationary or slowly moving one. The upper field is often made smaller than the lower, so that as much ground as possible may be seen in the field of view. This system is known as the "invert," and is used in many field range-finders.
3. The whole field is erect with the exception of a small central rectangle in which the image is inverted. The advantage of this system is that the field of view is as large as that of a range-finder of the erect type, except that the part covered by the rectangle is missing. It is known as the "invert rectangle" and is used in many field range-finders, especially in foreign armies.
4. The whole field is erect with the exception of a narrow horizontal strip which passes right across its centre. The field in the strip may be either erect or inverted. This system, known as the "strip" system, is used in the British height- and range-finder.

In early range-finders the axis of the eye-piece was horizontal when targets in the horizontal plane were being viewed. It is now usually inclined downwards at angles of  $45^\circ$ ,  $60^\circ$ , or even  $90^\circ$  for anti-aircraft work, so that the range-taker can observe from a more comfortable position. Eye-pieces can be focussed for individual observers, the two images of the target and the separating line coming to focus simultaneously. Coloured and neutral tinted glasses are useful in cutting out excessive glare, haze, etc. In some range-finders, the magnification of the eye-piece can be altered so as to obtain the best effect under various atmospheric conditions. Astigmatismers are sometimes used for drawing out a point of light or small object into long lines or bands. Coincidence, which without their use would be almost impossible to effect, can then easily be made. They consist of two negative cylindrical lenses with horizontal axes, one being placed at each end of the range-finder between the pentagonal and the objective.

Range-finders are provided with halving and coincidence adjustment heads, which, when turned slowly, move the optical systems mentioned above. Correct adjustment is of course essential for accurate work.

**Accuracy of One-man Range-finders.**—The accuracy of the range-finder, other things being the same, depends upon its base length and magnification; but there are limits to the magnification which can be conveniently used. It is usually between 10 diameters (for the smaller range-finders) and 30 (for the largest). Under good conditions, two images can be aligned across a fine separating line, with an error of only a few seconds. There is little doubt that this degree of accuracy can be obtained under the best atmospheric conditions and when the target is stationary, as the mean result of several observations being taken as the range. If, however, the atmospheric conditions are bad and the target is moving rapidly, such accuracy cannot be expected.

The base lengths of range-finders used in the field usually vary between half a metre and two metres. The Barr and Stroud range-finder with a base of one metre, which is used for field artillery by the British and other armies, is typical.

German field coincidence range-finders, such as the Zeiss and Goerz, are used in a similar way to the Barr and Stroud, although their construction differs materially in details. Many of these were introduced to avoid infringements of earlier patents. The chief features of Zeiss coincidence range-finders are that they have only one eye-piece in which are seen a small rectangular inverted field in the centre of a large erect field and on the left of these a range scale. Coincidence is effected by revolving a working head which rotates two wedge-shaped prisms in opposite directions.

**Stereoscopic Range-finders.**—The principle of the stereoscopic range-finder is entirely different. Stereoscopic range-finders have not found much favour in the British services; but they have been extensively used by the Germans. Speaking generally, a stereoscopic range-finder contains the elements of a stereoscopic telescope rigidly mounted in a tube. It is very similar in outward appearance to a coincidence range-finder with two eye-pieces. Objects viewed through a stereoscopic range-finder are seen to stand out in stereoscopic relief; and it is comparatively easy for the observer to judge their relative distances. The actual distance of a target is obtained with the assistance of one or more marks which are seen in stereoscopic relief in the field of view. By means of suitable optical arrangements the stereoscopic relief of either the objects in the field of view or of the mark can be varied until the target and mark appear to the observer to be the same distance away from him. The range of the target can then be read off a range-scale attached. The mark which is seen in stereoscopic relief, really consists of two similar marks which are photographed on glass diaphragms mounted in front of the eye-pieces of the range-finder. If the two marks are on the optical axes of the two halves of the range-finder, they will appear to the observer as one mark at an infinite distance. If the two marks on the diaphragms are made to approach one another, the resulting single mark will appear to come towards

the observer. In the later stereoscopic range-finders, marks in the eye-pieces are adjusted so as to appear to be at a fixed distance when seen stereoscopically. The view containing the target appears to approach or recede from the observer when the working head is turned; and the range is read off from an external range scale or drum.

Stereoscopic range-finders suffer from the disadvantages that very few people are able to see stereoscopically with sufficient exactness to obtain good results and the degree of accuracy obtained by a range-taker appears to vary from time to time. Under the same atmospheric conditions, stereoscopic range-finders do not appear to give such good results as coincidence ones. Owing to the marks on the diaphragms in the eye-pieces being more distinct than the image of the target, there is difficulty in deciding when they are at the same apparent distance. On the other hand, owing to both eyes being used, the target should be seen more distinctly than through a coincidence range-finder. Ranges of targets with the sky as a background, e.g. aircraft, masts of ships, and trees on a crest line, are comparatively easy to take with a stereoscopic range-finder; but those of comparatively indistinct objects, objects with near backgrounds and objects in a shadow, e.g. a gun under a tree, are very much more difficult to take.

**Directors.**—The director is an instrument employed chiefly for the measurement of azimuth angles and angles of sight. There are numerous patterns of these instruments. Some are of simple form; while others are complicated and are provided with quick and slow motion movements for their azimuth and altitude movements and for laying on a gun or target without the setting of their azimuth scales being altered. Some are used as directors pure and simple, whilst others are provided with powerful telescopes for observing fire. British directors are graduated in degrees and minutes, whereas those of nearly all other powers are graduated in millimetres. Instruments graduated in millimetres can be made much more compact than those graduated in degrees and minutes, as the main azimuth plate has only 64 divisions instead of 360. The azimuth scales of some German directors are graduated in 16ths of a degree and 16ths of a degree are also sometimes used for angle-of-sight scales.

The German director for field artillery is a good example of modern types of this instrument. Powerful telescopes like the stereoscopic or scissors telescope are often provided with fittings which enable them to be used as directors as well as for observing fire. Azimuth angles can be measured by means of an azimuth scale, and angles of sight by means of a small bubble and scale. In one pattern of German stereoscopic telescope, the angle of sight is measured by means of a device which is compactly placed between the two arms of the telescope, above its elevating gear.

**The Field Plotter.** is an instrument used for obtaining the gun range when the range-finder is not near the gun. It consists of two similar nickel-plated steel plates, having azimuth scales and a scale of yards (upon which the distance of the gun from the range-finder can be set) engraved upon them, and two range arms which are pivoted at the centres of the azimuth scales and connected by means of a slider. The two plates are slid along one another until the distance between the gun and the range-finder is opposite the reader. The slider is then moved until an arrow upon it reads on the arm the distance from the range-finder to the target. The arm is then moved until another arrow reads the angle, recorded by the director, between the target and the gun. The plotter is then turned over, and the range from the gun to the target and the angle at the gun between the target and the director are read off. When fire has been opened, it is necessary to observe the results, so that corrections for both range and direction may be made. Also if time fuzes are used, the angular height above the target at which they burst the shell must be observed and corrected if necessary. Various instruments, e.g. graticuled binoculars, stereoscopic telescopes and periscopes, are used for this purpose.

The binoculars used in the British service are of the prismatic type having a magnification of six diameters and are fitted with

a glass diaphragm in front of the right eye-piece on which are engraved the vertical lines  $\frac{1}{2}^\circ$  apart; their heights above the horizontal line being alternately  $\frac{1}{2}^\circ$  and  $1^\circ$ . The central line is longer, extending  $1\frac{1}{2}^\circ$  above, and  $\frac{1}{2}^\circ$  below the horizontal line. When observing fire, the point of intersection of the centre vertical line with the horizontal line is laid on the target; and, when the burst of the shell is observed, its angular distance to the right or left of the target and above it can be ascertained by noting its position with reference to the lines on the diaphragm. Graticules used by other continental powers vary very much in design and often consist of a very large number of short lines at definite distances from the axis of the telescope.

The stereoscopic or scissors telescope was very largely used in the World War, especially by the Germans. The British pattern has a magnification of 10 diameters and a field of view of  $4^\circ$ . The two arms can be used either vertically for observation from below cover, or in line with one another for observation from behind vertical cover.

## FOR COAST DEFENCE

Coast defence range-finding instruments are usually either range-finders or position-finders. A range-finder measures ranges *from itself* to the target and may also record the bearing of the target. A position-finder measures ranges and bearings to the target *from the point for which it has been adjusted*. This would usually be a gun which may be many hundred yards away from the position-finder. The position-finder sometimes also records the range and bearing of the target from its own position. Coast defence range-finding instruments may be divided into classes, depending upon the nature of their bases, as follows:—

1. Depression instruments, having vertical bases (either range-finders or position-finders) the accuracy of which depends upon their height above the sea-level. They measure ranges with equal accuracy in all directions; and, if sufficient height is available, they are most reliable instruments. It is usually considered that, to obtain ranges with an error not exceeding 1%, 100 ft. of height is required for every 5,000 yd. of range. All that the range-taker has to do is to keep a cross wire in the telescope of his instrument laid on the water line of the target.

2. Instruments having a fixed horizontal base (usually position-finders). Each usually consists of two instruments installed at the ends of a base which may be several thousand yards in length, the length required depending upon the range and arc of fire of the gun for which the instrument has been installed. The instrument at one end of the base is known as a transmitter and usually consists of a telescope mounted above an azimuth circle. It measures the bearing of the target and transmits it to the instrument at the other end of the base which is known as the receiving instrument. The bearings may be transmitted by telephone; or, as the telescope is traversed, electric impulses may cause some portion of the receiving instrument, e.g. a metal arm or a dial, to move automatically. The receiving instrument is usually an accurate, solidly constructed plotter, made to a certain scale, e.g. 500 yd. to an inch. In its simplest form it would consist of a base plate upon which two straight arms were pivoted, the relative positions of the pivots being, to the scale of the instrument, the same as those of the transmitter and receiving instrument. The first arm would be kept set to the azimuth angles received from the transmitter, and the second arm would be kept in line with the target by means of a telescope attached to it. The point where the two arms intersect would represent the relative position of the target. The arms being graduated in ranges and moving over azimuth scales, the range and bearing of the target from either end of the base could be read off. By means of a third arm, pivoted to the base plate in the position representing the position of the gun, the range and bearing of the target from the gun could be ascertained if the arm were brought above or below the point of intersection of the two other arms. Horizontal-base range-finding instruments are often designed to allow of several alternative bases being used, the pivots of the arms in the receiving instrument being set for the base which is most suitable for the conditions prevailing at the time. Thus for very long ranges a very long base would be used; but, if the visibility were bad, a much shorter one might be preferable. Horizontal-base instruments have certain disadvantages. For a definite range, their accuracy varies with the position of the target. It is greatest when the target is opposite the centre of the base, decreases as the target moves to the right or left, and disappears altogether when the target is in line with the base. It is somewhat difficult for the receiving instrument to indicate to the transmitter the target whose range is to be found. There are difficulties in passing azimuth angles from the transmitter to the receiving instrument. If they are telephoned, delay and errors are involved, and owing to the fact that they may

alter at greatly varying rates there is usually some uncertainty as to the most suitable intervals in which they should be called out. If they are electrically transmitted, so as to move some part of the receiving instrument, the mechanism must be capable of moving in small steps of, say, one minute, in order to obtain the required accuracy, and at the same time it must be capable of moving quickly through a large angle when getting on to a target.

3. *One-man Range-finders* used for coast defences are constructed on the same general principles as those used in the field; but, as their weight and size must not be limited to the same degree, many modifications to make them as accurate and convenient as possible are introduced. Their base lengths are usually between 9 ft. and 10 metres, but even longer bases have been considered. They are practically always of the coincidence type with both fields erect.

The *Mark III Depression Range-finder* (fig. 2) will be taken as a type of a depression instrument. In this range-finder the range-finding triangle is reproduced in the instrument on a small scale. Figure 1 shows diagrammatically how this is effected by means of

FIG. 1.

two arms. AB represents the height of the axis of the telescope above the surface of the sea BC. Ab represents the distance between the pivot of the telescope arm Ac and the range arm bc, and this to the scale of the instrument, represents the height AB. When the instrument is level, the arm cb is horizontal, and therefore parallel to the

FIG. 2.—Depression Range-finder Mark III.

surface of the sea. cb is subdivided and graduated in equal divisions to the scale of the instrument. Ac, which has a telescope mounted on it, is pivoted at A and can be directed on to the water-line of a target at C. The triangles ABC and Abc are similar, and the length of bc therefore represents to the scale of the instrument, which is 1,000 yd. to an in., the actual range BC. Similarly bd will represent the range BD of a target at D. If the instrument is required for use at any other height than AB, the telescope arm pivot A would be raised to a height above cb corresponding to the new height of the range-finder above the sea. In the foregoing, the surface of the sea has been considered as a plane surface, whereas it is really the surface of a sphere with its centre at the centre of the earth. Allowance for this curvature could be made by making the arm bc the arc of a circle instead of a straight line. It is, however, found to be more convenient to curve the telescope arm Ac in the opposite direction, the effect being the same. Corrections for mean refraction are made in the same way as those for the curvature of the earth, but in the opposite direction; the arm Ac being curved to allow for the combined effect of curvature and refraction.

The *Small German Position-finder* may be taken as a typical position-finder. It was used during the World War for coast artillery on low sites. Very much larger instruments based on the same general principles were also used. Air communication was by telephone. Other nations often use automatic electrical transmission for moving parts of the receiving instrument when the transmitter telescope is traversed, and for actuating range and bearing dials on the gun mountings when the gun arm is traversed.

The *Barr and Stroud Range-finder* having a base-length of 30 ft. is typical of the one-man range-finder used for coast defences.

None of the range-finders or position-finders mentioned above is of any use if it cannot see the target; the position of a moving target can then only be ascertained by aerial observation.

*Naval Range-finders*, which must necessarily be of comparatively small size, are nearly always of the one-man type. They are generally similar to those used in coast defences, but in order to obtain better illumination their optical parts are often made larger. Their mountings are designed to enable the range-finders being kept on the target in a sea way. They are nearly always of the coincidence type with both images erect; but some stereoscopic range-finders have been used by the Germans. It is thought by some that a range can be more rapidly taken from a ship having considerable motion with a stereoscopic range-finder than with a coincidence range-finder; as with the latter it is difficult to keep the separating line across the target. The coincidence range-finder will, however, give more accurate results. Range-finders with a base-length of 10 metres are the largest which can conveniently be used on board ship. Base lengths vary with the size of the ships on which the range-finders are employed and the uses for which they are intended; one of less than a metre being employed for navigational purposes. Anti-aircraft range and height-finders used on ships must be provided with some form of pendulum to keep certain of the parts horizontal, as the mountings cannot be kept level. Certain small range-finders have been made which can measure the range to a ship if the height of its mast or funnel is known. This height is used as the base of the range-finding triangle, the angle of parallax being measured by the instrument and read off as a range. Such a base is obviously longer than that of a range-finder which could be carried on a ship. This type, however, has not been generally adopted.

#### FOR AIR DEFENCE

Range-finders and height-finders used in connexion with anti-aircraft guns have a much more difficult task to perform than the range-finding instruments used in the field or in coast defences. In the latter cases the target, if it moves at all, will move in one plane only and its speed will not approach that of aircraft. As the result of experience, the range of an aerial target which may alter by several thousands of yards in a minute is not taken into account; but its height, which will not vary to the same extent, is used as the basis of laying  $\delta$  and is measured by a height-finder. The rate of burning of the fuze has also to be considered, as it will not be the same for a definite range if the target is at different heights.

When laying a gun on aircraft, the setting of the sight is therefore based on the height and angle of sight of the target and on the setting of the fuze. At the beginning of the World War, no height-finders were available, so existing one-man range-finders, e.g. the Barr and Stroud, were used, and long base height-finders which could be rapidly made were introduced.

FIG. 3.

*One-man range-finders* were usually of two metres base length, and coincidences were made on the target in the usual way. In order to convert the ranges into heights, a slide-rule attached to the range-finder was employed. One scale of this slide-rule was automatically set to the angle of sight of the target, by means of a cam, as the elevation of the range-finder was altered. The other scale was set to the range recorded by the range-finder, and the height of the target could then be read off.

*Long base height-finders* usually consist of two instruments at the ends of a base about a mile in length. Sighting planes in these instruments are kept laid on the target; the triangle formed by the intersection of a vertical plane with three planes, one of which is a horizontal plane passing through the base and the other two are extensions of the sighting planes, is mechanically solved; and the height of the point where the two planes of sight intersect (i.e. the height of the target above the base) is plotted at the same time.

The principle of this method is shown in fig. 3. AX and BY are two horizontal lines, parallel to each other. The sighting planes of

the instrument would be attached to axes whose axes were on any parts of AX and BY. AXQZ and BYQZ represent planes of which the sighting planes form small parts. It is obvious that QZ is horizontal, and that ZK, PL or any vertical line between QZ and the horizontal line ZL (which is parallel to the axes of the sighting planes) represents the height of an aircraft in the line ZQ, say at P. In the simplest form of height-finder, the plotting is done on a board fixed beneath B, the triangle AZB being reproduced there on a small scale and upside down. A straight edge is attached to the sighting frame at B and consequently moved round B in front of the board as the elevation of the frame is altered. Another straight edge is pivoted on the right of B at a distance from it which represents AB to the scale of the instrument. It is kept set to the altitude angle which is measured at A and telephoned to B. The point where the two straight edges intersect consequently represents the point Z. Upon the board below B, a series of horizontal lines are marked, their distance from a zero line passing through the pivots of the straight edges representing heights above the ground, to the scale of the instrument. The height of the target can therefore be ascertained by noting against which of the horizontal lines on the board the intersection of the two straight edges comes. Such height-finders have serious disadvantages, the principal one being the difficulty in getting the two instruments on to the same target.

**Height- and Range-finder.**—Towards the end of the war Messrs. Barr and Stroud produced a most ingenious instrument which recorded both the height and range of aircraft, and which was at once adopted by the British Government.

It is used in a similar manner to an ordinary one-man range-finder, and the observer has only to keep the aircraft in the field of view and make coincidences. As will be explained later, if the height of the aircraft remains constant the coincidence will not alter as the range alters. The field of view is so arranged that the rays of light entering by the left window of the instrument form an erect image over the whole field, with the exception of a narrow central horizontal strip in which an inverted image is formed by the rays entering by the right window. The lower separating line is the one on which coincidences are made. The advantage of this "strip" system is that it is considerably easier to keep the aircraft in the field of view than if the field were divided into two equal parts, one of them being inverted. As in field instruments, the inversion of the image in the field above the separating line is found to facilitate making accurate coincidences.

The eye-piece of the range-finder is placed at right angles to the plane of triangulation, so that if the angle of sight to the target is  $60^\circ$  the observer looks down at an angle of  $30^\circ$ . It is provided with two lens combinations on a rotatable cap which give magnifications of 15 and 25 diameters, and also with light filters for varying atmospheric conditions. There is a window above and to the left of the eye-piece, through which the usual ivory range scale can be seen.

In a small casing on the top of the range-finder there is a most ingenious mechanism which converts ranges into the heights corresponding to them as the angle of sight varies. The ranges and heights can be read through two windows in close proximity to one another. This mechanism actually solves the trigonometrical formula  $r \sin a = h$ ; where  $r$  is the range of the target,  $a$  the angle of sight to it and  $h$  its height. This formula may be written as:  $\log r + \log \sin a = \log h$ ; and it is mechanically solved as follows:—A differential gear is employed, the upper member of which is rotated in accordance with a logarithmic sine scale of angles of sight, and the lower member is rotated in accordance with a logarithmic scale of ranges, the jockey wheel accordingly revolving around the axis of the differential with a motion corresponding to a logarithmic scale of heights. It will be noted that the angle of elevation and the range are known, or rather are determined by the instrument, so that the duty of the gears is to convert the angle and range scales to logarithmic form and then to add them together by means of the differential gear as explained above. The conversion of the reciprocal range scale motion of the range-finder deflecting prism gear into logarithmic range scale motion, and the angular motion, of the range-finder in elevation into motion corresponding to a logarithmic scale of sines, is done in each case by means of toothed spiral gears.

The gearing is connected through three couplings to the working head, the elevation gear and the deflecting prism gear respectively. By means of suitable gearing the jockey wheel of the differential is driven from the working head, the upper member by the elevation gear, and the lower member by the deflecting prism gear. The range scale is connected to the lower member, and the height scale to a level wheel carrying the jockey wheel.

The advantage of arranging the working head to operate the jockey wheel is that in the frequent case of aircraft flying at a constant height the images in the field of view, when once set, can be kept in coincidence by simply elevating the instrument so as to keep the target in the centre of the field, without any rotation of the working head. The movement of the instrument in elevation automatically controls the position of the deflecting prism, the height scale remaining unaltered so long as the working head is not rotated. When the target rises or falls, the images will move out of coincidence and must be brought back into alignment by rotating the working head, thus altering the reading of the height scale by the appropriate amount. The working head and elevating gear may, of

course, be worked at one time, in which case the combined effect of the spiral gears and the differential is that the two scales always read correctly as long as the coincidence is maintained.

The instrument has a base length of two metres, and is carried in the mounting works in two eccentric bearing rings, the object of the eccentricity being to balance the weight of the height-scale gear box as the instrument is rotated in elevation. The elevating gear with a handwheel on the left of the observer, is of the worm-wheel type. The handwheel is provided with a two-speed clutch; the speed being changed by merely pressing in or releasing, with the palm of the hand, a small lever connected with the hand grip.

The azimuth training gear is also of the worm and worm-wheel type and has a two-speed clutch. Its handwheel is on the right of the eye-piece, and in a convenient position for the man who, looking through a small prismatic telescope near the right-hand end of the instrument, keeps it laid for direction on the target.

The worm wheels for movements in both azimuth and altitude are mounted on friction slip-bearings, so that the instrument can be rapidly moved and the target brought into its field of view. An elevating lever is fitted near the left-hand end of the instrument to allow of rapid elevation. An adjustable azimuth scale and reader are provided; and a means of levelling the upper part of the mounting. Before using the instrument, its correct levelling must be attended to and checked by means of two bubbles attached to the upper part of the mounting. The lower part of the mounting is a very rigidly constructed tripod with pointed feet having discs to prevent their sinking into soft ground.

Three operators are required for working the instrument, viz.: (1) The observer who makes "coincidences" by turning the working head on the top of the instrument with his right hand, and who also keeps the separating line on the target by turning the elevation handwheel with his left hand. (2) The operator for line who, looking through the prismatic sighting telescope, traverses the instrument with the handwheel and keeps the cross line in his telescope accurately laid for line on the target; and (3) the scale reader, who, standing in front of the instrument, reads heights off the height scale; and, if required, also reads the range and angle of sight scales.

In anti-aircraft gunnery, where the target may move at a speed of two or more miles a minute, there is great difficulty in ascertaining what deflections are required to compensate for the travel of the target during the time of flight of the projectile. There is not only the lateral deflection to be considered, as with a ship moving in one plane; but also a vertical one. It is obvious that if an aircraft is flying at a constant height, the angle of sight to it from the gun will not remain constant. Vertical deflection equal to the alteration of the angle of sight during the time of flight of the projectile must therefore be allowed for. Another difficulty arises in connexion with the setting of the fuze. The fuze will not burn at the same rate if the projectile is fixed at different angles of sight, owing to the variation of atmospheric pressures at different heights. To help to overcome these difficulties a most ingenious apparatus was brought out during the war by Messrs. Brocq of Paris, and was adopted by most of the Allied Powers.

The general principle of the instrument is as follows:—The height of the target must first be measured by a height-finder and set on the instrument. Two operators, who face one another, follow the target, looking through two telescopes which are rigidly connected. One keeps a vertical cross line in his telescope in line with the target by turning a traversing handle; and the other keeps a horizontal cross line in line, by turning an elevating handle. Connected with the traversing and elevating handles are the armatures of two magnetos which, when turned, generate electric currents, the voltages of the currents depending upon the speed at which they are turned. These currents are transmitted to two special voltmeters (attached to the gun mountings near the layers) from which the lateral and vertical deflections required can be read off, and then applied to the sights. On their way to the voltmeters the currents pass through rheostats which modify them in such a way that the deflections recorded are correct for the time of burning of the fuze. The exact length of fuze required to burst the shell at the target can also be read off another part of the instrument.

The general arrangement of the apparatus is shown diagrammatically in fig. 4. It consists of three main parts, viz.:

1. The double telescope, which consists of a metal drum upon which are mounted, on the same spindle, the two right-angle telescopes referred to above. The traversing and elevating handles are placed conveniently for the two operators. Each has a quick and slow motion (four to one), the alteration from one to the other being effected by pushing in or putting out the handle. When a quick release knot at the top of the instrument is pressed down, the gears are put out of action, and the telescope can be quickly moved until the target is in their fields of view. Angles of sight and bearings can be read off conveniently placed scales, if required. When the handles are turned, the currents generated by the magnetos pass along

cables to the "fuze indicator and time rheostat" and thence to the "deflection voltmeters."

As the body of the "double telescope" traverses about a vertical axis, but laying is done in the plane of sight, it is necessary to multiply the angular velocity of the body of the instrument by the cosine of the angle of sight in order to obtain the angular velocity of the target. This is effected electrically by passing the current from the lateral magneto through a rheostat, whose resistance is varied by a rubbing contact passing along it, as the telescopes are elevated or depressed.

Another rheostat and an accumulator (connected to the fuze indicator and time rheostat) cause an angle of sight needle in the fuze indicating voltmeter to move to the same angle of sight as that of the telescopes; this needle is controlled by another circuit.

2. The fuze indicator and time rheostat consist mainly of the time rheostat, a fuze indicating voltmeter, a microphone and an external accumulator of three cells.

As explained above, the currents generated by the magnetos pass through rheostats on their way to the deflection voltmeters. These rheostats are situated beneath the time adjusting dial, and their resistance is altered as the dial is turned. The setting of the dial is dependent upon the height of the aircraft and the setting of the fuze, and is effected as follows:—A graduated height arm is moved by means of a milled head until it reads the height obtained from a height-finder. On its right-hand upper edge is a reader for reading the fuze curves on the time adjusting dial. The latter is turned until the reader of the height arm is on the fuze curve representing the length at which the fuzes have been set.

FIG. 4.—Arrangement of Brocq apparatus.

The angle of sight needle in the fuze indicating voltmeter is controlled by two circuits, viz.: that referred to in (1) which tends to set it at the angle of sight of the telescopes, and another in which are the vertical magneto armature in the double telescope, the rheostat beneath the time adjusting dial and another rheostat which automatically adds eight seconds to the time of flight. This eight seconds is an allowance for the time taken to set the fuze, load, lay and fire the gun. The angle of sight needle therefore makes with its zero or horizontal line an angle equal to the angle of sight to the predicted position of the target at which the shell will burst. When the height arm is moved, a height strip inside the fuze indicating voltmeter is also moved. Its height above the zero line of the angle-of-sight needle represents, to the scale of the instrument, the height of the target. The intersection of the needle and strip therefore represents the position of the target at the moment of the shell burst. Fuze curves are marked on the glass cover of the voltmeter, and the curve which is nearest to the intersection of the needle and strip will indicate the length at which fuzes are to be set. This fuze length is called down the microphone to the fuze setters, and is transmitted to the sight setter by the man taking up the shell.

3. The deflection voltmeters are of the dead-brat type and read to  $10^5$  on either side of zero. Two are provided for each gun; one for lateral and the other for vertical deflection. As a rule, two guns can be worked by one Brocq equipment, four deflection voltmeters being provided. The required deflection is read by the upper pointer. Corrections for wind are applied by moving the scale by means of a knob beneath the voltmeter, the amount of correction being indicated on the scale by the lower pointer.

Stereoscopic range-finders were extensively used by the Central Powers for anti-aircraft work. (A. C. W.)

#### SOUND-RANGING

The method of locating hostile guns by the sound, or sounds, consequent on their discharge was introduced on the British front in France during 1916. It had at that time already been in use in the French army for many months. It speedily proved its usefulness, especially in circumstances which rendered other methods of location very difficult or impossible. The system

of concealment known as "camouflage" added considerably to the difficulty of finding the position of gun-pits on photographs taken from the air, and, further, these photographs offered no certain method of deciding whether a gun position, once identified, were occupied or no. The locations given by sound-ranging frequently enabled well-concealed positions, which had previously been missed on air photographs, to be detected, and offered a sure index as to whether known positions were active at a given time. Although air photographs always offered valuable confirmation of the sound-ranging locations, and were, when available, consulted with this object in view, the method is, of course, quite independent of such support. It works as well at night, or when, owing to fog, mist, or smoke, the visibility is poor, as on clear days; it can detect batteries so well hidden as to be invisible from the air or on air photographs; it is always ready when once the apparatus has been installed; and a location can be obtained, under favourable conditions, within a minute or two of the arrival of the report of the piece. On the other hand the instalment of the apparatus necessitates the laying of several miles of wire, and involves considerable preliminary labour in other ways; the method will not work during a heavy bombardment; and certain weather conditions, to be discussed later, render locations almost impossible. The difficulty first mentioned will quite possibly be surmounted or diminished; the other two seem, at present, insuperable.

The method has been elaborated to permit the directing of fire on a hostile piece by comparing the record of the sound of discharge of the piece with that of the burst of the shell directed against it. With 12-in. and 9.2-in. howitzers destructive shots have been directed very successfully by sound-ranging.

**Principles.**—The method generally adopted in the British, French, and American armies is to record the instant of the arrival of the sound made by the hostile piece at certain fixed and carefully surveyed posts, spaced at intervals varying from 1,000 to 2,000 yards. If it be assumed that the sound spreads out from the source with a known velocity, the same in all directions, then a known interval between the arrival of the sound at two fixed posts will determine a curve on which the source must lie. This curve is a hyperbola with the two posts  $P_1$  and  $P_2$  as foci, for the determining condition is that the difference of the radii vectors  $SP_1$ ,  $SP_2$  be constant. If, in addition, the time of arrival at a third post be known, then the interval between this and the time of arrival at either  $P_1$  or  $P_2$  will fix a second hyperbola on which the source must lie, and so determine the position of the source. In practice three posts are not sufficient, since any uncertainty caused by the recording of a spurious sound at a post would falsify the location. In general six posts are used, which, taken consecutively in pairs, give five lines which should all intersect. Any accidental selection of the record of a spurious sound at one or more of the posts is then at once detected by the non-intersection of the curves. Records of the sound at five, or indeed four, of the posts are generally sufficient for the experienced sound-ranger, even when several guns are being recorded at short intervals, so that the use of six posts allows for the sound not being successfully recorded at one or two of the posts.

**Nature of Sounds from High-Velocity Guns.**—In the preceding argument it has been assumed that the sound spreads out with uniform velocity in all directions from the source. There is little doubt that this is true, in a still atmosphere of uniform temperature, of the sound of the discharge of the piece. With the modern high-velocity gun, however, a second sound, originating in the motion of the shell through the air, always accompanies the sound of discharge. This second sound is due to a pulse of compression set up by the shell, known as the "shell-wave," or "onde de choc." It is perceived by an observer in front of the gun as a sharp crack, which is followed after an interval depending on the type of gun, the elevation of the gun, and other factors, by the duller, heavier sound of the discharge, or gun-wave. To examine the formation of the shell-wave by the passage of the projectile, consider the resultant disturbance produced by the pulses of compression travelling out with the velocity of sound from every point of the path of the shell. For simplicity take in the first case a projectile travelling horizontally with a uniform velocity greater than that of sound; let  $G$  be the position of the gun,  $S_1$ ,  $S_2$ , ...  $S_n$  be the positions of the projectile at the end of the 1st, 2nd, ... 10th second (fig. 5). When the shell is at  $S_0$  the compression originating at  $G$  has travelled out as a spherical shell with  $G$  as centre for 10 seconds, that originating at  $S_1$  has travelled out as a spherical shell with  $S_1$  as centre for 9 seconds, and so on. The envelope of all these spheres is a cone with its apex at  $S_0$ ; if the shell be travelling closer to the surface of the earth the trace of this cone on the surface is  $AS_0C$ , which represents the pulse of compression under discussion. If the velocity of the shell be considered to decrease with time, as in any actual case, the

interval of space between centres of successive generating spheres will decrease as the shell travels, and the enveloping cone will be modified (fig. 6). The form of the shell-wave will resemble roughly a paraboloid of revolution, the vertex being at the shell as long as the latter has a velocity exceeding that of sound, and consequently travelling with a velocity greater than that of sound. After the velocity of the shell has dropped below that of sound the shell-wave travels out in all directions with the velocity of sound normal to the surface.

FIG. 5.

The exact form of the shell-wave will depend upon the range table of the gun and the interval since the shell left the gun, and cannot be specified as being any familiar surface. The trace of the wave on the plane of the earth's surface, with which the observer is in general concerned, depends further upon the elevation at which the gun is firing. Since the sphere representing the position of the gun-wave is one of the generating spheres the shell-wave will touch this sphere. In fig. 6 where G is the gun, ABC the trace of the gun-wave on the horizontal plane, ASC the trace of the shell-wave, within the cone represented by AGC both sounds will be heard, outside the cone only the sound of discharge. The interval between the two sounds is

FIG. 6

clearly greatest on the line of fire, decreasing as the observer moves to a flank. As the gun is elevated the interval detected by a listener in a fixed position decreases, the trace of the shell-wave approaching that of the gun-wave. This is illustrated in fig. 7. If the gun be sufficiently elevated no shell-wave is heard by a listener at any position on the ground, though it may be heard in an observation balloon. Thus the double sound has been heard by an observer so situated in the case of a 9.2-in. howitzer, firing with full charge (M.V. 1,500 f.s.), while observers on the ground heard only the single sound.

Owing firstly to the selective sensitiveness of the human ear, and secondly to the fact that the shell-wave is generated well above the surface of the earth, and travels down to the ear without meeting obstacles and without being hindered by refraction effects, the shell-wave alone is usually heard when the hostile piece is distant, and is spoken of as the sound of the piece by the casual listener. Any attempt to take rough bearings on a gun by estimating the direction from which the sound appears to be coming then leads to a very erroneous result, since it is the normal to the shell-wave that is selected. Unless the listener is on the line of fire such a bearing will pass considerably in front of the piece. To calculate the position of a gun from the intervals between the arrival of the shell-wave at different posts requires a knowledge of the exact form of the wave in question at various times of flight, and this presupposes a knowledge of the range table of the gun, and the elevation at which it is firing (given by the approximate range). It is clear that to apply the sound-ranging method to records made by the shell-wave is a matter involving information not always available, and considerable preliminary work on the construction of curves representing shell-waves for different hostile guns firing at various elevations when it is available.

FIG. 7.

In the case of howitzers the horizontal component of the muzzle velocity is less than the velocity of sound in all ordinary cases, so that only one sound, the gun-wave, is heard on the ground.

**Instruments.**—The instruments comprise: (a) detectors, placed at each of the six surveyed posts, which give an electrical response to the arrival of the sound, and (b) a recording instrument, placed at a central station and connected by a separate circuit to each detector, which registers the exact time at which each detector responds.

When the method was first tried by the French the detector used was a soldier, who pressed a key when he heard the sound of a hostile piece, the key closing a circuit which actuated a pen on a smoked paper chronograph at a central station. This method

FIG. 8.—Hot-Wire Microphone.

involves inevitable errors due to the personal equation of the observer, and is further invalidated by the fact that, in the case of guns, the observer frequently hears only the shell-wave. The difficulties of working from records of this kind have already been discussed. Later, carbon microphones with large wooden diaphragms were introduced, small cells being included in circuit with the microphone and a primary coil, all at the post; the circuit leading back to the recording instrument included a secondary coil wound on the primary. These microphones suffered from the fact that they had a range of sensitiveness similar to that of the human ear; they responded readily to chance sounds, such as the clatter of equipment, or to shaking, and they registered the shell-wave in preference to the gun-wave. They were superseded (first in the British army, and ultimately in all the Allied armies) by the hot-wire microphone invented by Maj. W. S. Tucker (British patent No. 13123 of 1916,

and No. 8948 of 1918: see also *Phil. Trans. Roy. Soc., A*, vol. 221, p. 399). This depends on the principle utilized in the hot-wire anemometer, i.e. the change of electrical resistance consequent on the change of temperature of a heated wire which ensues when the air round it is set in motion. A very fine wire of platinum, whose resistance at atmospheric pressure approaches 100 ohms, is mounted in the form of a grid over a circular hole some 7 mm. in diameter (fig. 8). It is provided with terminals. It is included in one arm of a Wheatstone bridge, and sufficient current passed through the network to heat the wire to a dull red. The bridge is balanced so that when the air round the wire is undisturbed no current passes through the galvanometer. Motion of the air causes the resistance of the wire to decrease, upsets the balance, and so causes a current to pass through the galvanometer.

The microphone wire is mounted in front of an air container of some 16 litres capacity. Resonance effects in this container may be partly eliminated by small openings made in the wall. The instrument so completed is insensitive to all sounds of speech, musical sounds, traffic, or even rifle fire. It responds readily, however, to gun sounds (which are low frequency disturbances), even when they are inaudible, and records also the shell-wave. Its reaction is very rapid, and the small lag which does occur appears to be the same for all similarly constructed instruments.

An essential part of the recording instrument is a galvanometer for each circuit which shall respond very rapidly to the current caused by a sound reaching the microphone. For rapid response it is necessary that the moving part of the galvanometer shall be very light indeed—the moving coil or moving magnet type is out of the question. The condition is satisfied by the Einthoven galvanometer, in which the moving part is a very fine wire (through which flows the current to be detected) mounted in a magnetic field. The wire moves in a direction normal to its length and to the direction of the field. Six wires, insulated from one another, and provided with separate terminals, can be mounted side by side in the field produced by a single small electromagnet. This provides in a small space what is essentially six independent galvanometers, one of which is included in the bridge belonging to each microphone. As the sound reaches successively different microphone posts the corresponding galvanometer wires move in rapid response.

The instant at which each wire begins to move is registered on a moving photographic film. The camera in which the film runs vertically is furnished with a horizontal slit, a cylindrical lens in front of the slit reducing its effective breadth. Shadows of the perpendicular galvanometer wires, cast by means of an electric lamp and an optical system mounted in the pierced poles of the galvanometer magnet, fall on the slit, and are focussed on the film, appearing there as six points of shadow on a horizontal line of light. As long as the wires are still each point leaves on the running film a straight line; the movement of a wire registers itself as a break in this trace.

If the film ran at a uniform speed measurement on the developed film of the distance between the breaks would give the required time intervals. As this is not the case the following device is adopted: a wheel provided with ten flat spokes, one of which is somewhat wider than the others, is mounted in the case containing the lamp, so that, when it is rotated, the spokes successively interrupt the light which illuminates the galvanometer wires. The wheel is actuated by a synchronous motor controlled by a tuning fork, and rotates ten times a second. As a result of this arrangement there appear on the film lines perpendicular to the direction of the motion, the intervals between which correspond to hundredths of a second, every tenth of a second being marked by a wider line. This recording apparatus was devised by Dr. Lucien Bull, of the Institut Marey, near Paris.

Originally the film was cut off after the required record had been taken, and developed in a small dark room adjacent to the instrument. Later a method of automatic development was devised, by which the film passed successively through developer and fixer while running, and emerged ready for interpretation.

Fig. 9 shows some typical records. (a) and (b) are records of two differently situated 5.9-in. howitzers taken by six posts in each case. The burst of the shell was also registered on these films, but as it occurs several seconds later space does not permit the inclusion of the part of the record in question. (c) is a record of a field gun, showing both shell-wave and gun-wave. Only five posts were used for this record. The varying interval between the two sounds at the different microphones is well shown: at the flank microphone, corresponding to the lowest trace, only one sound is heard. (d) is a record of the burst of a British shell on a German position.

**Influence of Weather Conditions.**—The method in use demands that to every time interval shall correspond an exact distance, a standard velocity of sound being assumed, which corresponds to some standard temperature and still air. (The velocity of sound does not, of course, vary with the pressure, and the effect of humidity is in general negligible.) Hence the time interval read off from the film has to be corrected for temperature and wind before it is used on the board prepared for location. For the temperature variations which occur in ordinary circumstances the increase of velocity of sound may be taken as proportional to the increase in temperature, so that the temperature correction is easily applied. Simple geometrical considerations show that the correction for wind depends only on the velocity and direction of the wind and the position of the microphone,

and not at all on the position of the gun. With given microphone positions a diagram can be prepared which allows the rapid graphical determination of the correction for a known wind.

It has been found by experiment that the temperature and wind which are concerned in these corrections are not those prevailing at ground level, but at a height of between 250 and 500 ft. up.

Owing to the refraction of sound by wind the record of a given sound at ground level is greatly influenced by the variations of wind velocity at different heights above the ground. This wind gradient determines largely whether the conditions are favourable or unfavourable for the detection of sounds. In the case of a wind increasing in velocity with height, a following wind, besides increasing the velocity of the sound, tilts the wave front so that the sound converges on the listener or instrument on the ground, and is well heard. An opposing wind causes the sound to tend to pass upwards and leave the ground. Hence a wind blowing from the instruments towards the hostile piece often renders sound-ranging almost impossible if it be of any strength. The temperature gradient also plays a part in the refraction of sound.

FIG. 9.—Typical records of Bull apparatus.

**Location from Record.**—Having seen how the intervals between the arrival of the sound at different posts can be accurately obtained and corrected to standard conditions it remains to discuss how these intervals can be made to supply the position of the gun with as little delay as possible. A map board is prepared with an accurate "grid" (coordinate system of squares) covering the region in which locations are expected. On this the microphone positions are accurately marked. The posts are usually taken consecutively in pairs; with each pair as foci a family of hyperbolae may be drawn giving the loci corresponding to various time intervals (at standard velocity of sound). In practice, however, to avoid the labour of preparing the hyperbolae it is usually preferred to use the asymptotes instead of the curves themselves: for these it is only necessary to have a thread attached to each mid-point between pairs of consecutive posts, and a scale plotted round the edge of the board for each base, graduated in time intervals, so that when the thread is placed to pass through a given graduation it is the asymptote to the hyperbola corresponding to the interval. To allow for the divergence of the asymptote from the hyperbola, which becomes serious as the base is approached, tables are prepared giving the corrections (always additive), in terms of the length of the base and the distance from the mid-point of the base, to be applied to the time intervals obtained from the record. The asymptote corrections having been applied to the various intervals, already corrected for temperature and wind, the asymptote corresponding is laid out for each base. The various lines should all intersect at a point: in general they do not, but form a small polygon from which the position of the gun can be estimated.

**Estimation of Calibre.**—The position of the hostile burst may be obtained from the record of its sound in the same way as the position of the piece, and the interval between the departure and burst of the shell, i.e. the time of flight, can be computed from the record on one microphone. Thus the record gives the time of flight corresponding to a given range, which affords an indication of the calibre of the piece. In the case of guns, as distinct from howitzers, a further indi-

cation can be obtained from the interval between shell-wave and gun-wave at the different posts.

*Work in the Field.*—It is not feasible to have the film running continuously during any period when records are expected. It should be started a second or two before the sound reaches the first microphone. In the field this is effected by having two forward observers in front of the line of microphones, so placed, one to each flank, that either the one or the other of them must hear the sound of the hostile piece a few seconds before it reaches any of the microphones. These observers are provided with keys, the depression of which starts the film running. They also report by telephone informations judged useful as to the estimated calibre, the approximate location of the burst, if seen, and so on.

The line of microphones in general covers a front of some 8,000 yd. and is some 2,000 yd. or more from the front line. It is usually preferred to place the instruments at approximately equal intervals on a smooth curve, which may be a straight line, or the arc of a circle either convex or concave towards the enemy, according as guns well to a flank have to be located, or attention is concentrated on a more central group of guns. Such arrangements lead to greater ease of identification of a record than is possible if the microphones are very irregularly placed.

The microphones may be placed anywhere where the hearing is good: the only obstacles which seem to cast sufficient sound shadow to affect them are high hills just in front of them. They may be put in shallow depressions dug for them, and should be protected from splinters, and also from wind and draughts. Canvas and hurdles may be used for this latter purpose without appreciably affecting the sensitiveness of the instruments.

*Ranging on Hostile Pieces.*—A heavy burst near a hostile gun position will furnish a sound record of its position just as does the gun itself. Fire may be directed on a piece which is in action by comparing the records which it supplies with those of the bursts of one's own answering shell. Since both gun and burst are located by the same method all uncertainties introduced in an ordinary location by ignorance of the precise atmospheric conditions are eliminated.

A differential method is adopted, the difference of times of arrival of the sound of the hostile gun and of the friendly burst at each microphone being plotted as ordinates against a certain simple function of the relative positions of the microphones and the hostile gun as abscissae. A horizontal line then corresponds to a direct hit; a straight line sloping to left or to right to an error of line to one side or the other; a curve (approximately an elliptical arc) convex or concave downwards to an error of range. The magnitude of the corrections necessary is easily estimated from curves previously prepared.

**RANGER, HENRY WARD** (1858-1916), American painter (see 22,891), died in New York City Nov. 7 1916.

**RASPUTIN, GREGORY EFIMOVITCH** (1871-1916), Russian monk and court favourite, was born in 1871 in the village of Pokrovskoe, near Tyumen, in the province of Tobolsk, Siberia. He was the son of a poor peasant whose disorderly behaviour resulted in his being given the name of Rasputin, meaning "debauchee." He received no education, and till the end of his life was unable to write properly. He spent the first part of his life till the age of 33 in his native village; he married in 1895 a well-to-do girl, Olga Chanigoff, and they had two daughters and a son. In 1904 Rasputin resolved to change his mode of living. He left his family and devoted himself to religious exercises, declaring to his people that he was inspired by God. His passionate nature, his great physical strength, and the superstitious atmosphere in which he had been brought up, gave an unexpected direction to his religious exaltation. He adopted the views of the sect known under the name of "Khlsty," the leading idea of whose teaching was that salvation could be achieved only by repentance.

"Sin in order that you may obtain forgiveness"—was the practical rule which he drew from this doctrine. "A particle of the Supreme Being is incarnated in me"—he told his hearers. "Only through me you can hope to be saved; and the manner of your salvation is this: you must be united with me in soul and body. The virtue that goes out from me is the source of light, the destruction of sin" (E. J. Dillon, *The Eclipse of Russia*). This extravagant and dangerous teaching, which resulted in practice in the most wild orgies, not only created for Rasputin immense popularity and the reputation of a holy man among his fellow-peasants, but opened before him the doors of some of the most fashionable Russian houses and even those of the Imperial Palace. Looking for new experiences Rasputin left his native village, and made long pilgrimages to various holy places, and even went to Mount Athos and Jerusalem. He spent some time in

different monasteries and applied himself to the study of holy books, but his lack of elementary education reduced the results of his labours almost to nothing. He only retained by heart some incomprehensible passages, and often used them in his prophecies. He had, however, a strong magnetic power, the influence of which was recognized by his bitterest opponents.

In 1907, during a stay in St. Petersburg, Rasputin was introduced to the Archimandrite Feofan, rector of the Theological Academy and confessor to the Empress, who took an interest in the story of his conversion. The Archimandrite, with the assistance of the Grand Duchesses Militia and Anastasia, presented Rasputin at court, and he produced a deep impression on the Empress and Emperor. The mystic atmosphere which always prevailed at the Russian court, and which was especially strengthened by the disasters of the Japanese War, the internal troubles in 1905, and the constant fear for the health of the Tsarevich, created a convenient background for the appearance of such a man. His disdain for all rules of good behaviour, his dark prophecies, and, above all, the eventual improvement in the health of the Grand Duke Alexis, which more than once seemed to result from his influence when medicine was ineffectual, created an exceptional position for him with the Empress. Disgusted with the Russian intellectual classes and the bureaucracy, she saw in Rasputin the representative of the mass of peasantry, the only sure support of orthodoxy and autocracy, specially sent by God to save the heir to the throne and preserve the dynasty. Rasputin took advantage of this belief, and did his best to persuade the Empress that his fate was closely tied with that of the imperial family. The example of the court was followed by a large section of the upper class, and many doors were opened for the "Saviour," as the Empress used to call him. For some time Rasputin was satisfied by this side of his social success, and at first he did not interfere in politics. But his activity was felt in church questions. His friendship with the famous monk, Heliodor, and the Bishop of Saratov, Hermogen, which resulted in a complete rupture between them and in a series of scandals, had a painful echo in the country. The appointment of Varnava, an illiterate peasant and a friend of Rasputin, to be Bishop of Tobolsk in 1911, and the extraordinary servility with which the Holy Synod followed the wishes of the favourite, provoked a strong opposition among all classes of society. The most prominent upholders of orthodoxy demanded a complete reorganization of the Russian church, and denounced the servile attitude of the Holy Synod. Guchkov, the Octobrist leader, in a famous speech delivered at the State Duma, made direct allusions to the nefarious influence exercised by Rasputin. But the influence of the "Saviour" was too strong to be checked by any expression of feeling in the country, and Rasputin triumphed over all his enemies.

An unsuccessful attempt to kill him, made by a certain Guseva in 1914, incited by the monk Heliodor, only strengthened his influence, which became especially powerful during the two last years of the imperial regime. No important nomination was made without his approval, and the most unexpected people rose to the highest offices as result of his interference. Rasputin was too ignorant to have any opinion on political questions: he was in most cases an instrument of the reactionaries. Numberless stories of the debauchery practised at the court, in which the name of Rasputin was coupled not only with some of the court ladies but even with that of the Empress herself, became a common topic of conversation in all classes of Russian society. At length a supreme effort to free the Empire and the dynasty from his influence was made by a small group of men of the highest social position, which included the Grand Duke Dimitri Pavlovich, Prince Yussupoff and M. Purichkevich. Rasputin was invited to a supper at the Yussupoff Palace on Dec. 15 1916, and shot dead, after an attempt at poisoning him with a strong dose of cyanide potassium mixed with wine had not produced the desired effect. His body was thrown under the ice of a canal. The death of Rasputin was a terrible shock to the Empress; she transferred his body to the park of Tsarskoye Selo, where a special chapel was erected, and came every night to

pray on his grave. The Grand Duke Dimitri Pavlovich was sent to Persia to join a fighting column. Yussupoff was ordered to leave Petrograd, and interned in his estate. Purichkevich, protected by his immense popularity in the army and by his title of member of the Duma, returned to his work on the front.

(P. VI.)

**RATHENAU, WALTER** (1867– ), German industrialist and political economist, president of the Allgemeine Elektrizitäts-Gesellschaft, was born Sept. 29 1867 in Berlin. He came into prominence in Aug. 1914 as the founder and director of organizations for providing raw materials, during the World War, for Prussia and the German Empire. On the formation of the War Ministry in May 1921 he was appointed Minister of Reconstruction, and in that capacity negotiated with the French minister, Loucheur, a convention for supplying German materials for the restoration of the devastated area in France, and thus paying in kind part of the reparation which the German Reich had undertaken to pay in gold. Rathenau published various books, pamphlets and articles, on social and economic questions, some of which attracted world-wide attention, especially his *Von kommenden Dingen* (1920). In Jan. 1922 he became Foreign Minister in the Wirth Ministry.

**RATHMORE, DAVID ROBERT PLUNKET**, 1ST BARON (1838–1919), Irish lawyer and politician, was born Dec. 3 1838, the third son of John, 3rd Baron Plunket (1793–1871). He was educated at Trinity College, Dublin, taking his degree in 1859, and was called to the Irish bar in 1862. He was made Q.C. in 1868, and the same year became legal adviser to the Irish government. In 1870 he stood successfully as Conservative member for Dublin University, holding the seat for twenty-five years. From 1874 to 1877 Plunket was solicitor-general for Ireland, and in 1880 was for a short time paymaster-general. In 1885 he was first commissioner of works in Lord Salisbury's ministry, and resumed this post in 1886, when the Conservative party returned to power, holding it till 1892. In 1895 he was raised to the peerage. He died at Gretnore Aug. 22 1919.

**RATIONING.**—In the articles **FOOD SUPPLY** and **SAVINGS MOVEMENT** the general question of food control during the World War is dealt with. During 1914–8 most of the European states, belligerent and neutral, were driven, by shortage of supplies, to ration the consumption of the more important foods, and in some cases of other articles, by the civilian population. "Rationing," of course, is a term of military origin; it denotes the supplying to each member of a fighting force or a beleaguered population of a definite "ration," based upon calculation of his needs, of the supplies available, and of the period for which they must serve. The process of rationing, therefore, has two sides—negative and positive: the negative side of preventing any individual from obtaining, by purchase or otherwise, more than the authorized quantity of the rationed article, and the positive side of making it possible for each individual in fact to obtain that quantity. It is thus a problem both of restriction and of distribution, and the success of any rationing system may be judged even more by the degree to which the positive side is carried out, than by the completeness with which the prohibition upon excessive consumption is enforced.

In this respect the British system of food rationing had for the reasons mentioned below a relatively high measure of success and is therefore described here in some detail. The modified system adopted in the United States is dealt with in a final section. Besides food and feeding stuffs for animals, fuel and light were rationed in the United Kingdom, and both these and many other things, such as clothing, tobacco, matches and housing accommodation, were rationed in various enemy and neutral countries in Europe.

#### BRITISH FOOD RATIONING

*Historical Sketch.*—The earliest steps to the introduction of compulsory rationing in Great Britain were taken in relation to sugar. Since the first month of the war sugar had been subject to Government control, under a Royal Commission on the Sugar Supplies, constituted in Aug. 1914. By the end of

1916 the quantity of sugar that could be obtained for the United Kingdom as a whole began to fall far short of the public demand, and in the first part of 1917 this reduced quantity was being distributed on the basis of giving so far as possible to each trader, whether wholesale or retail, 50% of the quantity which he had received in 1915, it then being left to the retailer to divide his supplies as best he could among his customers, subject to a limit of price. This simple system was necessarily very imperfect in action, and grew steadily less satisfactory owing to changes in the distribution of the population. With the development of the munitions campaign new towns sprang up as at Gretna or Birtley; old towns like Coventry or Sheffield or Woolwich doubled or trebled their population or acquired new suburbs; from many county districts and provincial or university towns in the south of England the population ebbed away. Distribution of sugar or any other article of food on the 1915 basis became manifestly inequitable.

During the first half of 1917, while the acute difficulties of the new munition areas were being relieved by temporary palliatives, such as the dispatch of additional supplies after enquiry by inspectors in each case, schemes for recasting the whole system of distribution on the basis of a complete fresh registration of the population were worked out and several alternative schemes were submitted to the War Cabinet in June 1917. The Cabinet adopted one of the alternatives, under which each household was to be invited to register for sugar with a particular retailer, to whom supplies of sugar would be sent in accordance with the numbers and size of the households registered with him, at a specified ration per head, but under which there would be nothing to prevent a retailer from using any surplus sugar in his hands to supply others, or to prevent persons from getting sugar, if they could, in excess of the ration, or from any retailer other than the one with whom their household was registered.

The scheme, while applied in the first instance only to sugar, involved the setting up of extensive administrative machinery, which could thereafter be used both for rationing other foods and for any other local work of the Ministry. This machinery consisted in essence of some 1,800 Food Control Committees appointed by the local authorities, but with their expenditure met from national funds, together with Divisional Food Commissioners appointed directly by the Ministry of Food for the 15 main divisions into which the country was divided, and having the special function of supervising, assisting, and coordinating the work of the committees. Immediately after the presentation of these proposals to the Cabinet (June 1917) the first food controller, Lord Devonport, resigned his office, and the proposals were approved by the Cabinet, subject to their receiving the subsequent assent of his successor, Lord Rhondda. The latter did in fact assent, and proceeded at once with the schemes both for redistribution of sugar and for divisional and local organization. The 1,800 local sanitary authorities in Great Britain were invited by circular (issued Aug. 2 1917) to appoint Food Control Committees, and did so during Aug. and the first part of September. Each committee set up a local "Food Office," usually in one of the municipal buildings, appointed an "Executive Officer," and during Sept. and Oct. issued to each household in the district a sugar card showing the number of persons in the household, and having a counterfoil to be detached and deposited with the retailer from whom the householder proposed to get his sugar. There was thus carried out a complete registration of the population by households in each district. The intention was to bring the distribution of sugar to each district on to the new (population) basis, as opposed to the old (1915 trade) basis as from Jan. 1 1918.

The sugar scheme, however, was never brought into force in the form approved by the Cabinet. In that form it was a distribution not a rationing scheme, was based on households not individuals, and deliberately made no formal provision for transfer of individuals from one household to another, or for persons too migratory to form part of any household. An alternative scheme for rationing by means of individual cards, entitling the holder to a fixed quantity and no more, had been

submitted to the Cabinet in June 1917 but was rejected, because at that time the Cabinet was not prepared for rationing as such. It seemed doubtful whether the public would submit to compulsory restriction of their food consumption; there was further an objection to giving the enemy the encouragement of seeing Britain apparently driven to extremities by the success of the submarine campaign.

By the end of Sept. it became clear that the public were prepared and anxious for definite rationing, that is to say for a system under which nobody could get more than a certain quantity and everybody could be certain of getting that. In Oct. and the following months accordingly the scheme was entirely revised and provision made for the household sugar cards to be exchanged for individual cards, and for any person who belonged to no household to obtain a document which should be the sole title to sugar supplies.

Another and more drastic change was also contemplated, namely, the substitution of a single centralized register of sugar consumers, that is to say of the whole population, for the 1,800 separate local registers which had resulted from the registration of households under the original scheme. The first steps to the formation of this central register—in the Imperial Institute buildings at South Kensington—were taken in Nov. 1917, and a good deal of preliminary work was done. The change over from local to central registration, however, was only to be made gradually, and was in fact never completed. After the success of the schemes described below—for rationing fats and meat on the basis of local registration (Feb.-April 1918), the idea of making a central register of the population was abandoned. The public, though at times mildly puzzled by the changes of the cards with which they had to deal, remained for the most part unconscious of the successive revolutionary changes in the ideas which dominated the administration of rationing.

The scheme, which had been started as one for the distribution of sugar to households in July 1917, came into force as a scheme of rationing by individuals on Jan. 1 1918 without a hitch. The reserve stocks at the disposal of the Sugar Commission were at that time considerable, and, since sugar is not highly perishable, the Commission had been able to distribute those stocks widely and to provide each retailer with an ample margin to meet contingencies. With insignificant exceptions, every person in every part of the country was able from the outset to get week by week the ration of half a pound of sugar to which his ration document entitled him.

Meanwhile, in the last quarter of 1917, the public became aware of serious shortages of other commodities, in particular tea, margarine, bacon and cheese. These shortages led to the appearance of queues at the shops and threatened to arouse grave industrial unrest. The centralized rationing scheme which was then the accepted policy in London could not come into force for many months. On the other hand the Food Control committees were established and at work; it was natural for Lord Rhondda to ask the committees to deal with the difficulty of the queues in the interim as best they could. One or two of the committees, among whom the Birmingham committee was conspicuous, started their own schemes for registering consumers with retailers and controlling the distribution of supplies to the retailers by the exercise of powers of requisition granted by the Ministry. General provision for such schemes was made by an Order of the Food Controller of Dec. 22 1917, which was called a Food Control Committees (Local Distribution) Order, but was in fact an order authorizing committees to introduce complete local rationing of any or every article, subject to approval of the scheme by the Ministry of Food. An important memorandum issued to the committees on Dec. 29 1917 outlined model schemes and gave advice and suggestions. The formulation of local schemes in congested industrial areas at once showed the impracticability of purely local action. It was clearly impossible for several Food Control committees in neighbouring districts forming part of a single industrial town to have different rationing systems, or for some to ration while the others did not. It was equally impossible for local committees

to control the distribution of foods, such as frozen meat or margarine, which are stored or manufactured at a few main centres for distribution throughout the country. These difficulties came to the fore at once in London and its suburbs.

At a general meeting of executive officers of the London committees held on Jan. 4 1918, it was resolved to have a single rationing scheme for the whole Metropolitan area and to ask the Ministry of Food to prepare such a scheme for approval by the committees as a whole. It became clear almost immediately that no convenient break could be made between London and the districts immediately surrounding it, and the home counties were included. The scheme was originally asked for to deal with fats (margarine and butter) alone, but the meat shortage became acute at a moment's notice in Jan., and estimates of the quantities available in the first quarter of 1918 made it imperative to include meat as well.

A scheme covering both fats and meat was worked out accordingly by the Ministry, approved at another meeting of executive officers, embodied in a "London and Home Counties (Rationing Scheme) Order," and brought into force on Feb. 25 1918 for an area containing something like 10,000,000 people. It involved the issue of two ration cards to each individual, one with detachable coupons for meat, and one for butter and margarine, without coupons, but with numbered spaces in which the retailer marked off the customer's purchases as they were made; each card had a counterfoil to be deposited with a retailer, and the supplies were distributed to retailers on the basis of the counterfoils deposited with them. The scheme had an almost melodramatic success. The London queues, which, according to the observations made by the Metropolitan Police, had included, in each of the weeks just before rationing, over 1,300,000 people, fell to 191,000 in the first week and to 15,000 in the fourth. Before rationing about 550,000 persons stood in food queues every Saturday in London; on the first Saturday after rationing the number was 110,000, on the next 24,000, and on the fourth Saturday under 7,000. In effect the queues for meat and fats disappeared altogether; there remained only queues for cheese, jam and other unrationed articles. The success of rationing was one of organization; the total amount of meat and fats available for consumption and actually consumed in London was not greater after rationing than before. It was simply better distributed and made obtainable without the labour of standing in a queue.

Meanwhile local schemes under the Order of Dec. 22 1917 had made considerable headway in the diminution or abolition of queues for butter and margarine outside London and the home counties. The local rationing of meat, however, presented insoluble difficulties, and even before the introduction and success of the London scheme the decision had been taken to introduce a national scheme for meat rationing as soon as possible. This was done on April 7.

The extension of meat rationing to the whole country was as successful as its introduction in London. The queues disappeared and everyone everywhere got his ration. This result decided incidentally the fate of the sugar scheme. The attempt to form in London a central ration register of the population was abandoned; the staff, till they could be dispersed, were used on other work in the checking of coupons, and arrangements were made to include sugar in the uniform scheme of national rationing through local committees which was introduced on July 14 1918, when each member of the public received a single book with different coloured leaves of uniform coupons for meat and bacon, fats, sugar, and lard. These, with jam included for the first time in Nov. 1918, were the only articles of food which were rationed nationally, *i.e.* throughout Great Britain. In addition tea was rationed in most of the great industrial centres under local schemes, and came within an ace of being included under the national scheme of July 1918. Cheese was rationed by a number of committees, but the varying consumption in different parts of the country and by different classes of consumers made any uniform system difficult; it continued to the end to be distributed on a "trade basis," that is to say by giving

to each trader a fixed percentage of his supplies in a datum year. Tea, on the other hand, though never rationed nationally, came to be distributed on a registration basis, *i.e.* in accordance with the actual population in 1918. In addition to articles for human consumption, feeding stuffs for animals were also controlled by the Ministry of Food, and in the latter part of 1918 were brought under a formal rationing system; this system hardly had time to come into full operation when the war ended.

The first national ration book had a currency of 16 weeks, and was succeeded by a fresh issue with no material change except an extension of currency to six months on Nov. 4 1918. After May 3 1919 coupons were abolished, but a limited system of rationing without coupons, by means first of the old ration books and later of identification cards, was continued for many months. Bacon and ham were freed from rationing in July 1918, lard in the following Dec., margarine in Feb. 1919, jam in April 1919, and sugar in Dec. 1919. With the freeing of butter in May 1920 and meat in Nov. 1920 rationing came to an end.

The foregoing sketch applies only to Great Britain. No rationing of meat or fats was attempted in Ireland, but a sugar distribution scheme, on the lines of the first British scheme, was put into force in Ireland by the Irish Food Control committee under powers conferred by the Food Controller.

*National Rationing Scheme.*—The Rationing Scheme, as finally established in July 1918, was a uniform national system administered by autonomous local committees, and having as its main features the use of individual ration books, the tie of each customer to a particular retailer, and the systematic supply to each retailer of the quantities required to meet the needs of his registered customers. A single application form had to be filled in by each household and forwarded to the Food Office, which thereupon issued a separate ration book for each member of the household. The ration book was a book containing different coloured leaves for various foods. Each leaf consisted of (a) a counterfoil to be signed, detached and given to the retailer with whom the holder of the book wished to register, and (b) coupons for each week's supply to be detached by the retailer when actual purchases were made. On registration of the customer the retailer besides detaching the counterfoil was required to enter his name and address on the appropriate part of the ration book. In addition to the leaves for foods rationed, such as sugar or meat, there were spare leaves which could be used for rationing other foods at short notice, and one of these was in fact adapted to deal with bread should the occasion ever arise. The book contained also a reference leaf, which served as an application form for subsequent issues. There were special books for children under six years of age (who got half rations of meat), books authorizing supplementary rations of bacon for manual workers and growing boys, and special books or leaves of coupons for invalids, travellers, vegetarians, Jews, soldiers and sailors on leave, and other particular classes.

The tie of each customer to a particular retailer was the essence of the scheme, the main safeguard against fraud, and the basis of distribution. Behind rationing as the public saw it—a paper affair of application forms, counterfoils and coupons—was a not less extensive and intricate machinery for distribution of the appropriate supplies through all the complex channels of trade week by week to every retailer in the country. The precise form of this machinery was naturally different for different articles of food; the common feature in all cases was that the retailer had to make an indent on a wholesaler in accordance with the number of persons registered with him, and each wholesaler in turn made application to a primary supplier (manufacturer, importer or other) based upon and accompanied by copies of the retailer's indents. The supplies flowed downwards through the various channels of trade in accordance with the applications and indents. The retailer's indents had in some cases to be approved in advance by the Food Control committees; in all cases their correctness was liable to be checked by examination of their registers of customers and of the counterfoils detached from the ration books.

In the case of meat, where the civilian supplies were mainly homegrown, there was needed in addition an elaborate organization, under Livestock Commissioners appointed by the Ministry of Food, for controlling the bringing of beasts to market, and their slaughtering and distribution, and for supplementing home supplies from the reserves of imported meat. In the case not only of meat, but of butter and margarine, there was a further difficulty—that the food was highly perishable and the retailers could not carry reserve stocks.

The importance of the tie to the retailer became apparent when it came to be realized that it would be perfectly possible to have a rationing scheme without coupons at all, if every individual consumer had to register at a particular shop and the supplies to that shop were adjusted strictly to the registration. The value of the detachable coupon was, first, in enabling the retailer to know whether he had already given a particular customer his supply for that week, and second, in affording a check upon the retailer, who could be required to make returns of supplies received, sold or retained, and to account for the supplies sold by producing an equivalent number of coupons. The staff collected for central rationing was used from April 1918 onwards to check the retailers' accounts by counting the coupons they had collected.

Apart from the points mentioned the technical details of most importance in the rationing scheme were the following:—

(1) The fixing of the ration for uncooked butcher's meat by value rather than by weight. Under the London scheme and the general meat scheme of April 1918 each card had for each week three coupons entitling the holder to buy 5d. worth per coupon, *i.e.* 1s. 3d. worth altogether of uncooked butcher's meat. As the price per lb. for each cut of meat was regulated by an elaborate schedule having regard to quality, to proportion of bone and to other matters, the fixing of the ration by value afforded an automatic means of adjusting the ration according to the cut selected. This device proved quite satisfactory and was continued in all subsequent schemes.

(2) The classification of "establishments," ranging from prisons and asylums to schools, hotels, living-in establishments, tea-shops and seaside boarding houses. With the single exception of the problem of the "self-supplier" this is technically the most difficult part of rationing, and the relatively efficient treatment of establishments in the British system was a considerable element in its general success. It is probably true to say that Britain was the only European country which made serious inroads on the comfort of living in first-class hotels or lunching at first-class clubs during the war.

(3) The provision for transfers of registration from one retailer to another, or from one district to another. This part of the scheme was framed with considerable care; the widespread organization of the Food Control committees bringing a food office within easy reach of every considerable number of inhabitants, and the reasonable latitude allowed to their officers in dealing with local and personal emergencies, prevented registration formalities from becoming intolerable.

The problems of "self-supply" and "direct supply," *i.e.* of persons producing food for themselves or obtaining food direct from the producer and not through a trader, arose in Great Britain only to a limited extent, and cannot be said to have been fully solved. Restrictions were imposed but were not pressed to the utmost.

The articles rationed and the amounts allowed at various dates are set out in the appended table.

*Comparison with Other Countries.*—The problem of rationing was simpler in Britain than in most European countries, and far simpler than in Germany and Austria, for the following main reasons: first, the deficiency of supplies below normal was less; second, the bulk of the British supplies were imported, not home-grown; third, the supplies of cereals could be and were kept at a point high enough to allow rationing of bread stuffs to be avoided altogether.

The difference in supplies is clearly illustrated by a table given in the article *FOOD SUPPLY* and published by the Ministry

of Food at the end of 1918, comparing the estimated consumption per head of certain essential foods in the United Kingdom, Germany and Holland before and during the war. Another striking contrast emerges in the report of a committee appointed at the Ministry of Food at the end of 1917 to prepare a comprehensive scale of rations covering meat, cereals, fats and

sugar. The committee based their scale on estimates of the minimum numbers of calories per day required by various classes of persons, according to age and occupation, and of the proportion that, having regard to other foods available, should be provided by these essential foods. Comparing their scale with the actual rations in force during 1917 in Hamburg (taken as typical of German industrial conditions), the committee found that the latter scale represented in respect of these essential foods and potatoes not more than  $\frac{2}{3}$  of the minimum requirements, while the shortage of less essential foods was probably even greater. The German ration of fat was reduced still further as from Jan. 1 1918, making the Hamburg rations per week for ordinary adults as follows:—Bread 4½ lbs.; Meat 9 oz.; Fats 2½ oz.; Sugar  $\frac{3}{4}$  lb.; Potatoes 7½ lbs. Men engaged in physical labour received a supplementary ration of 1½ lbs. of bread (per week), and those engaged in exceptionally hard physical labour received altogether 7½ lbs. of bread,  $\frac{3}{4}$  lb. of meat, 4½ oz. of fats,  $\frac{3}{4}$  lb. of sugar and 9½ lbs. of potatoes. These men would be few in number.

The weekly rations in Vienna by the end of 1918 were even lower:—Bread 2½ lbs. (with an additional 2 lbs. for heavy workers); Meat 4½ oz.; Fat 1½ oz.; Sugar nil, and Potatoes 1½ lbs.

The Austrian figures represent a breakdown of supplies and society. The German rations are those on which the civilian population of Germany sustained the war and made munitions during 1917 and 1918. They show a power in the human body to endure over months and years, at whatever cost in permanent loss of health and vigour, a scale of nutrition far below the minimum prescribed by scientific authority. They indicate at the same time the intensity of the strain to which the rationing regulations of the enemy countries were subjected.

The advantage to the British food controller in obtaining so large a part of his supplies from overseas was equally decisive. Imports were all brought automatically and completely under public control; nothing remained save distribution and the fixing of prices. The German and Austrian food controllers had to rely almost exclusively on home-grown supplies; they were faced by and failed to solve the problem of obtaining from the home producers a fair proportion of their produce for distribution under the rationing system. To a small extent this fact must be taken as a correction of the previous statement of rations as showing the actual consumption; an appreciable part of the total supplies escaping public control altogether was sold as contraband (*Schleichhandel*) to the urban consumers. The actual consumption in each family was the ration plus a varying proportion of contraband. The contraband trade, however, in Germany at least cannot have benefited more than a small proportion of the industrial population and was mainly an advantage to the well-to-do and to the hotels. It had a disastrous reaction on the general respect paid to the rationing regulations, and deprived them of that support of public opinion which was so marked in Great Britain.

The third great advantage of the British food controllers was that, by securing adequate tonnage for cereals, they were able to avoid the rationing of bread stuffs, and the elaborate and contentious system of graduated rations for different classes of workers which would otherwise have been inevitable. So long as rationing is confined to articles other than bread, a flat scale of rations for all adults, whether engaged in sedentary or in severe physical work, is possible; the larger amount of calories which the latter classes must have, in order to perform their work, can be obtained by increasing their consumption of bread. If bread as well as meat, fats and sugar are rationed this individual adjustment of consumption, according to the physical energy required, becomes impossible. The rationing system itself must provide differentiated rations for men doing varying kinds of physical labour or doing little or no physical work at all.

All the continental countries which rationed bread-stuffs had accordingly to introduce "supplementary" rations for heavy workers of different grades; the classification of the population for this purpose was one of the most difficult and contentious

*Rationing in Great Britain 1917-20.*

Article.	Period of Rationing (whether local or national).	Amount of Weekly Ration per Head.
Sugar . . .	Nationally—from Dec. 31 1917 to Nov. 29 1920	8 oz. Dec. 31 1917 to Jan. 27 1919; thereafter sometimes 12 oz. and sometimes 8 oz. with a drop to 6 oz. for a few weeks in Sept.-Oct. 1919, and again Jan.-March 1920.
Butter and Margarine . . .	Locally from Dec. 14 1917 to July 1918 (38,000,000); thereafter nationally to Feb. 16 1919 for both fats, and to May 30 1920 for butter alone.	5 or 6 oz. for both fats under national scheme. The London scheme started with a ration of 4 oz. The separate butter ration after Feb. 1919 varied from 1 to 2 oz.
Lard . . .	Locally from Jan. 1918 (1,500,000); nationally from July 14 1918 to Dec. 16 1918.	2 oz. nationally and in most local schemes.
Meat (Uncooked Butcher's Meat)	London and home counties from Feb. 25 1918 (10,000,000) with a few other local schemes; nationally from April 7 1918 to Dec. 15 1919.	Under the London Scheme 3 coupons entitling to 4d. worth each, or 1s. altogether (about 1 lb. with average bone), subsequently changed to 1s. 3d. Under the national scheme varying values as follows: 1s. 3d., 1s., 1s. 4d., 1s. 8d., 1s. 4d., 1s. 8d., 2s.
Bacon and Ham.	London and home counties from Feb. 25 1918 (10,000,000) with a few other local schemes; nationally from April 7 1918 to July 29 1918.	Under the London scheme 4 oz. with bone per coupon. Under the national scheme 5 oz. and 8 oz.
Other Meats . . .	All meat (including preserved meat, poultry, game, offal, venison and horse-meat) was included in original London scheme, but control was gradually relaxed.	Varying rations.
Jam . . .	Locally from early part of 1918 (500,000); Nationally from Nov. 4 1918 to April 15 1919.	4 oz. under national scheme.
Cheese . . .	Locally from early part of 1918 (2,000,000).	1½ oz. to 2 oz.
Tea . . .	Locally from Dec. 1917 (17,500,000).	1½ oz. to 2 oz.

*Notes.*—The numbers in parentheses give the maximum numbers covered by local schemes of rationing. The number covered by national rationing, i.e. the civilian population of Great Britain, in 1918 was 39,000,000.

In the London scheme and the first national meat scheme (April 7 1918) four coupons were provided to cover all meat of every kind. Three of these coupons only might be used for uncooked butcher's meat; any of them could be used for bacon, poultry, preserved meat, etc. The normal ration at the outset was thus 1s. worth ( $=\frac{1}{2}$  lb. with average bone) of uncooked butcher's meat, together with 4 oz. of bacon with average bone, or in place of the bacon, varying quantities of offal, poultry, game, etc. Later the rations were raised.

parts of the whole system; it appears to cut at the root of the principle of equality upon which rationing is based. In Great Britain a scheme of supplementary rations of bacon, for growing boys and for men engaged in physical labour, was introduced in April 1918, not so much for its own sake as in order to get the recipients classified, and so to prepare the ground, in case bread rationing became necessary, as at that time appeared possible. Fortunately the danger to the British bread supplies passed over; the supplementary rations of bacon, though they received the general support of the Food Control committees and were clearly right in principle, were strongly criticized by labour representatives, and were abolished when bacon was freed from rationing in July 1918.

While for the three reasons stated it must be recognized that the British rationing problem was immeasurably simpler than the German or the Austrian one, it may still be claimed that even allowing for this the British system was definitely superior in itself. First, the proper balance between centralization and decentralization of responsibility was attained. The British system was national and therefore uniform and fair in principle, but was carried out by local authorities with ample power to adjust it to local conditions. German rationing was local in origin; the central authorities had the impossible task of securing coördination subsequently; the traveller from one part of the country to another found himself under different regulations in every town. Second, the British food controllers never issued a ration book without a distribution system to back it. Third, the British system was probably superior in the ingenuity of many technical details. In respect of one of the main articles of food, namely meat, the British like the German controllers had practically to rely upon home-grown produce for the civilian population and had the same problem of collecting supplies from the producer. Fourth, and finally, the British system was more successful in giving equal treatment to rich and poor. This was its corner stone. Lord Rhondha had many doubts as to the practicability of rationing. He feared that the public would never submit to being limited in their purchases, tied to one retailer and subjected to transfer formalities every time they moved from one district to another. He found that the British people in war were prepared to submit to any and every restriction on their freedom of action so long as it applied fairly to all alike.

(W. H. B.)

#### UNITED STATES

Food rationing, properly speaking, was resorted to in the United States during the World War only in a modified form, and as to two commodities, wheat flour and sugar. That is to say, the rationing system under which a strict limit was set by law and regulation to the amount of food any person might purchase, as was the case in European countries where the rationed foods were issued only on presentation of official food cards, was practically unknown in the United States. The food saving there was accomplished in general as explained in the articles *FOOD SUPPLY: United States* and *SAVINGS MOVEMENT: United States*, through the voluntary self-denial of citizens in response to Government appeals and recommendations.

*Sugar.*—In the last three months of 1917 a serious shortage of sugar developed, and American householders, particularly in the eastern states, had difficulty in obtaining even small quantities for table use. This shortage emphasized the necessity for special attention to its conservation. As a first step, manufacturers of "soft" drinks, candy and related commodities, were directed to reduce their consumption to 80% of the amount used by them during the first six months of 1917. This attempt at conservation was not wholly successful in its operation as some of the less patriotic manufacturers ignored the direction. On May 15 1918, when the urgent need for shipping had resulted in a diversion of tonnage from traffic with Cuba to longer voyages, regulations were issued requiring that sales of sugar to manufacturers of the less essential foods and drinks should be made only upon presentation, by these manufacturers, of certificates which they were required to obtain from the federal food administrator of the state. These certificates were issued only upon proof that the applicant had not used since Jan. 1 1918, 80% of the amount of sugar used by him in the first half-year of 1917, and the certificate enabled the manufacturer to obtain only enough sugar to bring his total to this 80 per cent. The sugar shortage became still more serious, and with the prospect of a repetition of the ex-

perience of the fall of 1917, a rationing plan modelled upon certain European systems was put in force beginning July 1 1918. The refiner or manufacturer of sugar was forbidden to ship sugar to a purchaser except upon the receipt of a certificate issued by the federal food administrators. These certificates were issued to retailers on the basis of the number of their customers. Customers were allowed to purchase only on the basis of 1 lb. per person per month. This was increased to 2 lb. on Oct. 15 1918, and the restriction was removed in Nov. 1918. The local administrators were also authorized at all times during the home canning season to issue certificates permitting housewives to buy sugar in 25 lb. lots for canning purposes after the giving of satisfactory proof that it was desired for such purposes. A further regulation for manufacturers using sugar divided them into classes, with respect to the necessity for their products, and they were permitted to buy only on the presentation of certificates issued to them on the basis of their classification. Comparing the figures for war-time consumption of sugar in the United States with pre-war and post-war consumption, a saving of from 400,000 to 600,000 tons is shown to have been accomplished through conservation measures. Assuming it to have been 500,000 tons, it would have supplied people in France for a year, at their ration of 35 lb. per head.

*Wheat Flour.*—In addition to the appeals for voluntary conservation, which were particularly stressed with reference to wheat flour, compulsory regulations were put in force as to certain dealers and distributors of this commodity in Jan. 1918. This step was determined upon as a result of a particularly serious appeal addressed in that month to Mr. Hoover by Lord Rhondha, British Food Controller. Lord Rhondha cabled that unless the United States could furnish 75,000,000 bus. of wheat by July to the Allies, he could not be responsible for their remaining steadfast in the war. Accordingly flour mills were required to raise their percentage of extraction to 74% and to eliminate altogether the sale of patent flours. On Feb. 3 1918, the bakers were required to use 5% of substitute flour in all bread, and this amount was raised to 20% on Feb. 24 and on May 3 to 25 per cent. Rules were also promulgated early in 1918 requiring manufacturers of cake, breakfast cereals, macaroni and the like to limit their consumption of wheat flour to 70% of the amount they had used in 1917 for the same purposes. Since more than 50% of the flour consumed in the United States is used in home baking, it was necessary to require housewives as well as bakers to use substitutes for wheat flour. Regulations were accordingly issued, about Feb. 1 1918, requiring that no dealer or miller should sell wheat flour to an individual consumer without an equal amount of substitutes. The substitutes specified included all substitute flours, corn meal, corn grits, oatmeal and rice. Although this was not, strictly speaking, a rationing measure, it is estimated that it accomplished a saving of approximately 25% in the household consumption of wheat flour. Notwithstanding a shortage instead of a surplus at the beginning of the year 1918, the American people saved out of their own consumption sufficient wheat to send to the Allies, between Jan. 1 and the harvest, not merely the 75,000,000 bus. for which Lord Rhondha pleaded, but a total of 85,000,000 bushels.

The rationing measures described were withdrawn in Nov. 1918, and after that date there was no governmental limit upon the purchase for consumption of any food commodity in the United States. Although a sugar shortage developed there in 1919 as a result of the continuing world shortage, no revival of control over consumers' purchases was attempted in the United States. The Sugar Equalization Board, which had been continued in existence for distribution of the 1919 crop, revived, for a short time and to a limited extent, its control over distribution by directing to what sections of the country refiners should ship their product. The fact remains, however, that such rationing measures as the U.S. Government employed were in force only for a few months in 1918.

(W. C. M.)

**RAVEL, MAURICE** (1875– ), French musical composer, was born at Ciboure, France, March 7 1875, and received his musical education at the Paris conservatoire, under Fauré, Pessard and Bériot. His compositions include, besides songs, piano-forte music, and chamber music, the *Schéherazade* overture (1911), *Rhapsodie Espagnole* (1907), and the one-act opera *L'Heure Espagnole* (1907), first produced at Covent Garden in 1919.

**RAVENSTEIN, ERNST GEORG** (1834–1913), British geographer, of German origin, was born at Frankfort-on-Main on Dec. 30 1834, and was educated there. In 1852 he became a pupil of August Petermann, and came to England, where he served in the topographical department of the War Office from 1855 to 1872. As a geographer he was less of a traveller than a research student, and his studies led mainly in the direction of the practice and history of cartography. He compiled many original maps and atlases, bringing a fine critical faculty to bear

upon the data where these were not of the first order of scientific accuracy, as in his series of eastern equatorial Africa, scale 1:1,000,000 (1881-3), and of British East Africa, 1:500,000 (1889). One of his earliest writings was *The Russians on the Amur* (1861), but he was concerned mainly with the history of geography, as exemplified in his *Vasco da Gama's First Voyage* (1898) and *Martin Behaim, his Life and his Globe* (1908), as also in his history of cartography in the *E.B.* (see 17.633). He was an active member of the Royal Geographical Society and of the British Association, over the geographical section of which he presided in 1890, and in which he served as chairman of a committee which made a valuable enquiry into the climatology of Africa. He had also a particular interest in gymnastics, and published a handbook on them in 1867. He died at Hofheim in the Taunus, Germany, March 13 1913.

**RAWLINSON, HENRY SEYMOUR RAWLINSON, BARON** (1864- ), British general, was born Feb. 20 1864, son of Maj.-Gen. Sir H. Rawlinson, Bart. He joined the army in 1884, and a year later became A.D.C. to Sir F. Roberts in India on whose staff he served intermittently for some years. He took part in the Burma operations in 1886-7, and he was on the staff on the Nile in 1897-8, for which he was promoted brevet lieutenant-colonel; he had succeeded to the baronetcy in 1891. He went out to S. Africa on the staff in 1899, served through the defence of Ladysmith, and afterwards joined Lord Roberts and accompanied him to Pretoria and into the eastern Transvaal. Throughout the later stages of the war he commanded a column, and he was rewarded with a brevet colonelcy and the C.B. for his services. Then, after some months at the War Office, he became Commandant of the Staff College, passing on from there in 1906 to the charge of a brigade. He was promoted major-general in 1909 and commanded the 3rd Division from 1910 to May 1914.

He was at first employed at the War Office on the outbreak of the World War, but was in Oct. 1914 selected to command the IV. Army Corps that was being organized. He was in charge of the forces sent to assist Antwerp, and took part in the first battle of Ypres and in the Neuve Chapelle and the Loos offensives, being given the K.C.B. in 1915. He commanded the I. Army temporarily at the end of that year, was promoted lieutenant-general, and on the formation of a IV. Army was placed at its head. He commanded this during the battle of the Somme, achieving important successes, and was promoted general in recognition of his services. At the end of 1917 he was transferred temporarily to the command of the II. Army during Gen. Plumer's absence in Italy, and in Feb. and March 1918 he acted for some weeks as British representative on the Supreme War Council. But he was recalled from this to the field in April to resume command of the IV. Army before Amiens at a critical juncture. On Aug. 8 his troops in conjunction with the French attacked the enemy in this region and they gained a signal victory, which heralded the general advance of the Allies. His army played a prominent part a few weeks later in the storming of the Hindenburg line and in the subsequent victorious advance eastwards. On the final distribution of honours for the war he was raised to the peerage as Baron Rawlinson of Trent, received a grant of £30,000, and was given the G.C.B. In the latter part of 1919 he was sent to N. Russia to conduct the withdrawal of the Allies from Archangel and Murmansk, and on his return he commanded at Aldershot for a year. At the end of 1920 he went out to India as commander-in-chief.

**RAYLEIGH, JOHN WILLIAM STRUTT, 3RD BARON** (1842-1919), English physicist (see 22.933), died at Witham, Essex, June 30 1919. He was succeeded as 4th baron by his eldest son, ROBERT JOHN STRUTT (b. 1875), already so well-known as a physicist and F.R.S. that he is commonly cited as Strutt when references are made to his scientific papers.

**REA, SAMUEL** (1855- ), American railway official, was born at Hollidaysburg, Pa., Sept. 21 1855. In 1871 he joined the engineering corps of the Pennsylvania railway as chain and rod man, working on several branch lines. From 1875 to 1877 he was engaged, as assistant engineer, in the construction of the chain suspension bridge over the Monongahela river at Pitts-

burgh. He was next appointed assistant engineer for the Pittsburgh and Lake Erie, then under construction. He returned to the Pennsylvania lines in 1879, but ten years later joined the Baltimore and Ohio. For the latter road he was chief engineer for construction of the belt-line tunnel under Baltimore. In 1892 he was appointed an assistant to the president of the Pennsylvania railway and five years later first assistant. In 1899 he was elected fourth vice-president of the Pennsylvania, rising through the various grades to first vice-president in 1911, and when the numerical grades were discarded in 1912 was made vice-president. In 1913 he was elected president. He was also president at times of several other lines, including the Philadelphia, Baltimore and Washington; the West Jersey and Seashore; the Long Island; the Northern Central; and the Pittsburgh, Cincinnati, Chicago and St. Louis. He was in charge of the construction of the Pennsylvania station in New York City (completed in 1911) and the connecting tunnel under the Hudson river, as well as the New York connecting railway and Hell Gate bridge over the East river (opened in 1917). In 1917, after the United States entered the World War, he was appointed by the American Railway Association a member of the special commission on national defense of the Railroads War Board. He was also appointed director of the department of railroads, electric railways, highways, and waterways, of the division of transportation of the Committee of Public Safety of Pennsylvania. In 1917 he presented his private yacht to the U.S. Government for patrol duty in the Atlantic. In 1918, when the railways were taken over by the Government as a war measure, he was replaced as operating head of his road, but remained in charge of its corporate affairs. He was a member of the New York Chamber of Commerce, the American Society of Civil Engineers, the Institution of Civil Engineers of London, and the Society of Naval Architects and Marine Engineers. He was the author of *The Railways Terminating in London* (1888).

**READING, RUFUS DANIEL ISAACS, 1ST EARL OF** (1860- ), British lawyer and statesman, was born in London Oct. 10 1860, of a Jewish family. He was educated at University College school, and later at Brussels and Hanover, and after a brief experience of the London Stock Exchange he was called to the bar in 1887. He speedily earned the reputation of a brilliant lawyer, and in 1898 became a Q.C. In 1904 he entered the House of Commons as Liberal member for Reading, and in 1910 was made solicitor-general and knighted. The same year he became attorney-general, and in June 1912 was given a seat in the Cabinet—the first attorney-general to be so distinguished. In Oct. 1912, Sir Rufus Isaacs's name came under unfavourable discussion during the course of the enquiry into the Marconi contracts, but on the retirement of Lord Alverstone in 1913 he was appointed Lord Chief Justice of England. On the outbreak of the World War his advice on financial questions was of great value to the Government, and he was responsible for some of the most important measures immediately taken by the Treasury in connexion with the situation in the "City." Both at this time and later, his services in the sphere of national finance were, indeed, invaluable. In 1915 he went to the U.S.A. as head of the Anglo-French loan mission, earning golden opinions. He was raised to the peerage as Viscount Reading in 1916, and in 1917 again went as special envoy to America. On his return he was created Earl of Reading, and in 1917, on the retirement of Sir Cecil Spring-Rice, owing to ill-health, went to Washington for a brief period as high commissioner and special ambassador. At the beginning of 1921 he was appointed Viceroy of India in succession to Lord Chelmsford, and resigned the lord chief justiceship. Lord Reading married, in 1887, Alice, daughter of Albert Cohen. His only child, Gerald Rufus Isaacs, Viscount Erleigh (b. 1889), married in 1914 the daughter of Sir Alfred Mond.

**RED CROSS WORK.**—(1) **BRITISH.**—The British Red Cross organizations existing before 1905 were, in that year, amalgamated and formed into a new body called the British Red Cross Society. The immediate object of the society was preparation in time of peace for the ultimate work of rendering voluntary

aid to the sick and wounded in war. The War Office, which in the past had been somewhat embarrassed by casual offers of similar help from private individuals, undertook that, in the future, all such offers, other than the supply of certain personnel, should reach them only through the channel of the B.R.C.S., which accordingly began its task under powerful auspices. But it was not at first easy to interest the necessary numbers of people in proceedings depending for fruition on a contingency which most of them believed to be remote. The advance of science, also, together with modern ideas of humanity, had naturally resulted in the creation of an efficient army medical service, possessed of its own military hospitals and nurses, as well as complete equipment for the transport and treatment of wounded men. It was uncertain, therefore, what scope there would be for only partially trained helpers, even if there should be another great war in the future. The formation of the Territorial Force in 1908 provided a solution of the difficulty. Being a volunteer body called into existence for the purpose of home defence, its medical department was not such as would be self-sufficing in a campaign. The War Office accordingly invited the British Red Cross to apply itself to the formation of what are now known as Voluntary Aid Detachments, both of men and women, for service in connexion with the Territorial Force. The members of these detachments were to be prepared by instruction in first aid, sanitation, nursing, ambulance, cooking and other work, and to make provisional arrangements in respect of transport and temporary hospitals for the assistance of regular medical units during military operations in Great Britain. When war broke out in 1914, the B.R.C.S. and the Order of St. John, which was also engaged in organizing V.A.D.'s, had between them 2,374 detachments with a personnel of 70,352. Before the Armistice they numbered 4,083 with a personnel of 125,993. The original idea of the V.A.D. providing supplementary aid to the Territorial medical service was, owing to the exigencies of a European war, thrown into temporary abeyance. Their usefulness, however, was quickly adjusted to the necessities of the hour. They turned to excellent account the arrangements already made in accordance with the War Office scheme, and took a leading part in the transport and reception into auxiliary hospitals of the wounded.

But although the British Red Cross owed to the V.A.D. the advantage of having been able to enroll and educate voluntary workers in time of peace, its main object extended much farther afield. The root idea of the Red Cross is that whatever it can do to save the life or limb of a wounded soldier, or to alleviate his suffering, it is willing to do, without question, whenever and wherever its assistance can be usefully employed; and whatever can be provided to cheer or comfort him, in addition to what the taxpayer supplies, it will provide so long as its funds permit. On the other hand, the medical service of the army exists in order to do all that is reasonably necessary for its patients. That service may fail under stress, as may the army itself; but in principle it does not admit that voluntary aid is indispensable, except in so far as some of it may avoid the necessity for compulsory measures. No doubt, however, arises in connexion with additional comforts. Common sense draws the line between what a Government can be expected to give its wounded men, and what luxury, which must be left to spontaneous generosity on the part of the public acting through the Red Cross. The ostensible appeal of the British Red Cross was therefore for funds to enable the sick and wounded to be given comforts which they would not otherwise receive. But in practice a large part of Red Cross expenditure never strictly meets this description, and much but not all of it relies for defence on the ground that it has been the means of saving life. Thus, the Red Cross war library, which during the war provided over 5,000,000 books for hospitals, etc., and the 2,800 Red Cross work parties and depots, in so far as the articles they produced were not among those in army schedules, may be described as pure Red Cross efforts. But the ambulance launches sent to Mesopotamia for the transport of wounded, though they saved innumerable lives and their cost probably yielded better results, pound for pound,

than any other department of Red Cross work, were nearer the dividing line which separates the field of Red Cross activities from what should be army work. These launches alone carried 414,000 passengers and travelled 683,000 m., while at the various seats of war and in the British Isles Red Cross motor ambulance cars moved 10,000,000 sick and wounded cases. Yet, in fact, the transport of wounded, on which considerably more than £2,000,000 were expended by the Red Cross, was not strictly Red Cross work. It is the business of the army to clear up its own battle-fields at its own cost and take the wounded to hospital. Nevertheless, the enormous number of cases which the Red Cross was allowed to carry remains the best justification for the expenditure incurred until we know what would have happened had voluntary aid not been at hand. It is less easy to account for grants such as those made to the King George Hospital, a military establishment of 1,655 beds set up in the buildings of the Stationery Office, which was equipped by the Red Cross, and towards the expenses of which £154,000 were contributed, two-thirds of that sum being for payment of salaries, wages and ordinary expenses.

On the outbreak of war the B.R.C.S. appealed for funds, as did also the Order of St. John, which had rendered much service in the S. African War. The emergency was altogether exceptional, and the War Office soon broke away from its own regulation as to the sole agency of the B.R.C.S. in respect of voluntary assistance. In the result a joint war committee of the two organizations was formed, subscriptions were pooled, and this committee carried out all Red Cross war work undertaken in Great Britain with some exceptions. Scotland, which elected to proceed separately, raised over £2,000,000, thus providing for a fine independent effort. In addition the principal Dominions Red Cross societies sent commissions to the areas of war where their own contingents were serving, and made generous contributions to the work. Canada, Australia, S. Africa and Egypt were conspicuous examples. India was closely associated with the joint committee in connexion with Mesopotamia and E. Africa, and the American Red Cross gave valuable support. No voluntary collection in Great Britain had ever before reached the amount raised by the Red Cross during the war. Its success was very largely due to the generosity of *The Times*, which opened its columns freely to the advocacy of British Red Cross claims and the acknowledgment of subscriptions. *The Times* fund reached over £16,500,000 and covered many special efforts, such as the annual collections throughout the Empire, known as "Our Day." These produced for the four years in which they were held, over £8,500,000, of which more than five-eighths came from overseas. The farmers sent £1,000,000; the coal-owners and miners nearly £500,000; sales of pictures, jewels, etc., at Christie's amounted to £322,000; church collections to £283,000; and pearls given by ladies from their necklaces were sold for £94,000. Every class of society contributed either in money, work, or kind, and the sums received from individuals varied from 3d. to £25,000.

In addition to the cash which passed through *The Times* fund, gifts of stores to the value of £1,000,000 were made, and a very large unascertained sum was given locally through the auxiliary home hospitals above referred to. These latter, each of which was connected with one of the military centres, were set up in most of the principal towns throughout the country. Private houses, schools and suitable buildings of various kinds were converted into temporary wards, to which, in most instances, the minor cases were sent. They were, as a rule, served by V.A.D. members under a trained nursing staff and local medical men. In some a high degree of efficiency was reached, and to a few wounded were sent direct from the hospital ships. Rent and equipment were provided by subscriptions in the neighbourhood or private munificence, with, when necessary, grants from Red Cross headquarters; and the Government paid a capitation fee in respect of each patient, also affording through the country directors special facilities for rationed food supplies. It is estimated that over 3,200 auxiliary home hospitals were opened during the four years of the war. Their work received warm approval from the Army Council, who issued an inscribed scroll to each building as a permanent memorial of the patriotic purpose to which it had been devoted. That these institutions may claim to have afforded special comfort to wounded soldiers is indicated by the fact that the disciplinary measure most severely felt by refractory patients was their return to the military quarters from whence they came. Apart from the auxiliary home hospitals, a large sum was expended in equipping and maintaining hospitals abroad, special hospitals at home, and convalescent homes. Responsibility for the British Red Cross Society's hospital at Netley and the St. John Ambulance Brigade hospital at Etaples was undertaken by their respective associations. Mention should also be made of the British Red Cross Society's Star and Garter home at Richmond for totally disabled men, an institution intended to provide a harbour for those suffering from incurable spinal paralysis. In all, a sum exceeding

£5,000,000 was spent by the joint committee on hospitals and stores, excluding local expenditure on the auxiliary home hospitals. The stores department covered a great variety of items under general headings, such as textiles, provisions, tobacco, furniture, medical requirements, etc., and involved extensive business arrangements, with warehouses, buyers, and all the machinery of a large commercial establishment. Speed in delivery was a distinguishing feature, and the services of this department were on many occasions invited by the War Office. It was claimed with justice that no reasonable request which it was possible to comply with was ever refused.

A kindred department to the stores was the Central Prisoners of War Committee. The necessity for sending food to prisoners of war had resulted in various efforts which required co-ordination. The Government, as such, being prevented by Germany from supplying food to British prisoners of war, approved the formation of a committee under the Red Cross, which, by resolution of one of its international conferences, was entitled, and was consequently allowed by the enemy, to regard prisoners as coming within its duties. The committee administered a sum of over £4,000,000 and regularly dispatched parcels of bread, other food and clothing to the prison camps. Enquiries for wounded and missing, undertaken by the Red Cross from early in 1915 onwards, were also a much appreciated effort, resulting in over 384,000 reports being obtained at a total cost of less than 3s. 6d. each. Work for interned prisoners in Switzerland and Holland was another undertaking of high character, one of its chief objects being educational and industrial training. Much attention was bestowed by the Red Cross on the after-care of disabled men, both in connexion with accommodation for convalescents, and institutional treatment for patients suffering from neurasthenia, epilepsy, tuberculosis, paralysis and the results of wounds. It is obvious that medical or surgical treatment in such cases may be prolonged and yet not be inconsistent with some form of employment. The Government, realizing this, was prepared to maintain the patients, but difficulties arose on the question of capital outlay: "In any case," says the report of the joint committee, "as far as the Government was concerned, we were faced by delay in circumstances where promptitude was of vital importance to the success of the work. Being ourselves unhampered by restrictions other than the broad objects for which the public had subscribed to the Red Cross, and our funds being immediately available, we were able to obtain the sanction of the Joint Finance Committee for grants which met the necessities of the case. Thus, once again, was demonstrated one of the most valuable uses of such a fund as that administered by the Joint War Committee."

The report from which the foregoing extract is taken deals in detail with Red Cross activities in the various theatres of war, at all of which the joint committee was represented by a commissioner and staff suited to the circumstances. The most extensive work, of course, was that carried out in France and Belgium. There the first commission was sent in Aug. 1914, while the last of many proceeded to Vladivostok a fortnight before the Armistice in 1918. Some idea of the number of people employed by the joint committee will be gained from the fact that the total staff at home and abroad on Oct. 20 1918, was 9,234. Of these 1,353 worked at headquarters in London, 850 of whom were paid and 503 were honorary workers. It is only possible in this article to mention some of the efforts which were specially associated with the Red Cross during the war and have not already been alluded to. The supply of provisional limbs was a useful measure; invalid diet kitchens at Malta, Salonika and Egypt were a new and very successful experiment; and in Italy the ambulance units, among which may be mentioned one devoted to X-ray work, attained some remarkable results. Wherever it was possible to set up recreation rooms or to entertain the wounded, especially at Christmas time, the Red Cross undertook to do so; and at the conclusion of the war, after assisting in repatriation at Berlin and elsewhere, it continued, as it will continue for some years, to look after and help wounded men, particularly while they are waiting for final decisions as to pensions. Although the general direction of Red Cross business was in the hands of men, it is not too much to say that its outstanding feature was women's work. By hospital nursing and organization at home and abroad, motor-driving, restation attendance, and general service including the humblest domestic occupations, to which ladies turned their hands for long periods—British women established a lasting claim to national gratitude; and it may be said that the example they set did more to gain for them their present place in the constitution than several decades of propaganda.

At the end of the war, the joint committee was left with a considerable surplus, which approximated roughly to the amount received from the "Our Day" collection taken a few weeks before the Armistice. An Act of Parliament enabled such part of this balance as might not be required for the sick and wounded to be applied to kindred objects. A sum of £1,339,700 was given to civil hospitals and other institutions in England and Wales, and £544,300 to similar purposes in the dominions and colonies.

A heavy distribution of, for the most part, well-earned honours was made to Red Cross workers during and after the war, the chief criticism in connexion with which was that the higher grades allotted to the honorary and paid staff at headquarters in London were out of proportion to those recommended for commissioners and others

who had served for long periods abroad, often under trying conditions and sometimes in no small personal danger. On the whole it may safely be said that the Red Cross war fund was managed on sound business lines which gave general satisfaction to the subscribers, the Government, and the participants in its benefits, and reflected great credit on those who carried out the work.

Schemes for the Organization of Voluntary Aid in England and Wales, 1909 and 1910. Reports of the Joint War Committee and the Joint War Finance Committee of the British Red Cross Society and the Order of St. John of Jerusalem in England on voluntary aid rendered to sick and wounded at home and abroad and to British prisoners of war, with appendices (1914-9, H.M. Stationery Office). (J. D. P.)

(2) **UNITED STATES.**—The "American Association of the Red Cross" was organized in 1881, by the special efforts of Clara Barton (see 3,452) and with the approval of President Garfield and Secretary of State Blaine. Miss Barton was its first president. In 1905 the name was changed to National Red Cross, and the organization was incorporated and nationalized; the President of the United States became its president, and the War Department its auditor. By 1912, state relief boards operating under the National Relief Board of the Red Cross had been organized in practically all of the states in the Union as well as in the Philippine Is. and Porto Rico. In 1913 there were 60 chapters with about 12,000 members. In that year the association provided "disaster relief" in response to 13 calls in the United States and five from abroad. \$3,000,000 were used in relief operations, of which sum one and a third were contributed directly through the Red Cross. In the same year steps were taken to erect a national memorial building in Washington as a tribute to the heroic services, in connexion with the Sanitary Commission and other activities for the benefit of soldiers, rendered by women of the North and South in the Civil War. To an appropriation by Congress of \$400,000, as much more was added by private gifts, and the corner-stone of the building was laid on March 27 1915. The building was occupied as national headquarters early in 1917.

**World War Work.**—Early in the World War, before America's entry, the Red Cross, with the consent of the Government and in conformity with the treaty of Geneva, offered through the State Department the aid of its trained personnel and contributions of hospital supplies to every country involved in the war. The offer was accepted by all the belligerents with the exception of Belgium, which at first desired only supplies and did not ask for personnel until the spring of 1915. Japan, at first accepting, later declined assistance, as its own Red Cross was able to meet all demands, while Italy, when it entered the conflict, asked only for certain supplies. The Red Cross called the attention of the American people to the contributions made by European Red Cross societies during the Spanish-American War, and the President made a public appeal for funds. As a result, sufficient money was soon at the disposal of the Red Cross to undertake active aid to the various belligerents. Large quantities of hospital supplies and about 200 nurses were sent to Europe and distributed in England, Belgium, France, Germany, Austria, Serbia and Russia. Seventy-one physicians and surgeons were also sent, and a special sanitary commission of 43 doctors and nurses went to Siberia to fight the typhus plague there. The value of the relief supplies sent to Europe by the Red Cross before the United States entered the war exceeded \$1,500,000, of which about \$350,000 worth went to Germany and Austria. In the latter part of 1915, when the sanitary and general medical services of the belligerents had become sufficiently developed to make outside personnel aid unnecessary, the American surgeons and nurses were withdrawn from Europe.

In May 1917, a few weeks after the United States entered the war, President Wilson, as titular head of the American Red Cross, appointed a special Red Cross War Council of seven nationally known men, headed by Henry P. Davison of New York, to direct all the activities of the organization during the war. The first task of this War Council, besides effecting an expansion and elaborate reorganization, was that of obtaining

funds on a large scale to support the extensive work planned. It was decided to appeal at once to the people for a special war fund of \$100,000,000, and President Wilson designated the week of June 18-25 as "Red Cross Week" for the collection of money. Quotas were assigned to each state and city and a vigorous nation-wide campaign was begun. The result was a popular subscription of over \$114,000,000. The second great campaign undertaken by the War Council was a Christmas membership drive during the week of Dec. 17-24 1917. When the United States entered the war the Red Cross membership was about 500,000, comprised in about 500 chapters. By Nov. 1 1917 the membership had increased to 5,000,000, distributed among 3,287 chapters. The first aim of the special membership drive was for 5,000,000 further memberships, but when the campaign was actually launched the goal was set at 10,000,000. At the end of the drive week over 16,000,000 new members had been added to the organization. By the spring of 1918 it was found necessary to launch a new drive for funds, so extensive had been the war undertakings of the Red Cross. Again a nation-wide appeal was made, and during the week May 20-27, approximately \$170,000,000 was subscribed. These two great collections of 1917 and 1918, together with membership dues of about \$37,500,000 and special funds and supplies from various other sources, made up a grand total of a little more than \$400,000,000, of which about two-thirds was available for the needs of the national headquarters and one-third for the special needs of the 3,500 chapters. These special needs were such as purchase of materials to be made into relief articles, local canteen and home service, general operating expenses, etc. The undertakings of the American Red Cross during the war-time and armistice period can be classified under two heads: first, the relations of the Red Cross to the armed forces of the Government both at home and abroad, and, second, civilian relief abroad. With regard to the first category a paragraph in a report of the American Red Cross, prepared for the tenth International Red Cross Conference at Geneva on March 30 1921, sets out so admirably the manifold activities carried on that it may well be quoted. It is as follows: "The primary function of the Red Cross in war, of course, is to provide volunteer relief to the sick and wounded, and to serve as a medium of communication between the soldiers, sailors and marines and their families and the American people, but in the late war the American Red Cross activities for the fighting men covered a much wider field. From the time the American soldier entered the service until he had been demobilized, the Red Cross, at the request of the War Department, assisted him in many ways possible only to a large volunteer organization officially recognized. The American Red Cross recruited, organized and equipped hospitals and ambulance units, assisted in the care of the sick and wounded in emergencies, and mobilized nurses for the army and navy. The labour of volunteer Red Cross women provided the men in the service with knitted garments not a part of the army equipment, as well as an unlimited quantity of surgical dressings and supplemental medical supplies. Canteens established at many points in the home country and in the war zone provided the soldier *en route* with food, tobacco and other creature comforts. Home Service helped to maintain *moral* by rendering assistance in many forms to soldiers' and sailors' families. American fighters held prisoners in enemy camps, after being located through the International Red Cross, were supplied by the American Red Cross with food and other comforts. The sick and wounded behind our own lines were cheered and aided in their convalescence, the home-coming and demobilized troops were helped in readjusting themselves to civil life, and, finally, the graves of the fallen were photographed at the request of the War Department for the comfort of the home folks."

The details of the manner and extent of these various activities cannot be described here in detail. Place can be given to only a few special facts. Fifty Red Cross Base Hospital units, each consisting of 22 surgeons and physicians, 65 Red Cross nurses, and 152 Enlisted Reserve Corps men, were sent to England and France and one to Italy for duty with the American Expeditionary Forces. Forty ambulance companies of 124 trained men each were likewise

sent abroad. Over 23,000 trained nurses were mobilized, of whom nearly 20,000 saw active service, one-half of these in Europe. Sanitary service in America was carried on by 29 units of trained personnel assigned to districts in 16 states. A Woman's Volunteer Motor Corps of 11,000 members organized in 300 communities covered over 3,500,000 m. in their activities. Seven hundred canteens staffed by 55,000 women workers were operated in railway stations and camps. Ninety-two convalescent homes were built in the training and embarkation camps. One hundred and thirty canteens were established in France. Also, in France, the Red Cross maintained 24 military hospitals and 12 convalescent hospitals. Thirty-three canteens were established in Italy. Twenty-eight military hospitals and 82 canteens were established just behind the lines in that small part of Belgium never overrun by the Germans. A Home Service with 50,000 workers helped soldiers' families in many ways in America. Finally, 8,000,000 Red Cross women were engaged all through the war in producing comforts and hospital supplies for the American soldiers and sailors. Under the general category of "civilian relief abroad" is included the work done by the American Red Cross, from the time the United States entered the war up to 1921 when this work was still going on, in relieving the civilian populations of the war-ravaged regions of Europe. The distress during the war of the people of the Allied nations, especially in the devastated regions of Belgium, France, Italy, the Balkan States, Poland and Russia, seriously menaced the *moral* of those countries, so that this "civilian relief abroad" by the American Red Cross during the war period was of actual military assistance to the Allies. After the war this assistance, no less necessary, took on a more purely benevolent aspect and was extended in some measure to former enemy countries as well as to the Allies. The largest need and the largest response by the Red Cross was in France. A million and a half refugees from the 10 invaded French departments were scattered throughout other parts of the country. Besides, many Belgian refugees came into France. Disease, especially tuberculosis, threatened to become epidemic. The Red Cross undertook the task, for a time at an expense of \$1,000,000 a month, of housing, clothing, feeding and extending hospital and general medical aid to these civilians. This work was constantly done in association with national and local French organizations. Over 150 such organizations were aided. Sixty-seven hospitals and dispensaries, primarily for refugees, were operated by the Red Cross. Over 30,000 tuberculosis patients were directly reached and helped. A child-welfare campaign was also undertaken, partly of educational character. Special doctors and visiting nurses not only directly helped the children but organized instructional meetings and held special child clinics where modern methods were explained to nearly 300,000 French attendants. Perhaps the second largest item in civilian relief during the war was that of aid to Russia. A special commission was sent to Petrograd by way of Vladivostok, arriving in 1917, while Kerensky was in power, and provided 500,000 cans of condensed milk for children. An ambulance train of 125 cars was also sent to Russia, and \$1,500,000 was devoted to the assistance of Russian soldiers who were returning from the prison camps.

During the war the Red Cross lent assistance to 75 Belgian refugee colonies in free Belgium, France, Switzerland, Holland and England. In Italy 50 kitchens were maintained for needy civilians and direct financial assistance was given to the families of 326,000 Italian soldiers. In Rumania two hospitals and an orphanage were taken over and maintained, and in three districts 40,000 persons were fed daily. Special commissions went to Serbia and Greece and aided materially in caring for refugees and poor families in those countries. In 1918, at the height of the war activities, the American Red Cross had over 20,000,000 adult and 11,000,000 child (junior Red Cross) members comprised in over 3,500 chapters. Eight million of these members were listed as "war workers." The total revenues of the national headquarters and chapters together for the 20 months ending Feb. 28 1919 were \$400,178,000, of which \$272,676,000 was actually expended in war relief work in America and 25 foreign countries during the 20 months' period named, which covered all the time during which the United States was in the war plus the first three and a half months of the Armistice. Of this sum \$169,096,000 was expended by the national headquarters and \$103,580,000 by the various chapters. The former included \$28,978,000 for relief in America; \$57,207,000 in France; \$63,841,000 elsewhere overseas; \$4,660,000 for collections, enrolments, and publications; \$2,727,000 for operation of relief bureaux; \$5,530,000 for operation of bureaux handling relief supplies and transportation in America of these supplies; and \$4,360,000 for operation of administrative bureaux at national headquarters and divisional headquarters. The expenditures of the chapters included \$60,660,000 for materials purchased; \$8,700,000 for home service; \$3,070,000 for military hospitals and ambulances; \$2,320,000 for canteen service; \$1,680,000 for influenza relief; and \$7,490,000 for general operating expenses. The total resources (cash and supplies) of the national headquarters Feb. 28 1919 amounted to \$110,756,000, including unexpended appropriations of \$16,714,000, in addition the chapters had in hand a balance of \$33,460,000. A total of 101,000 tons of relief supplies had been sent overseas; 3,780 French and more than 1,500 Italian hospitals had been aided. The relief articles (surgical dressings, hospital garments and supplies, refugee garments, and various

articles for soldiers and sailors) produced by Red Cross volunteer workers during this time numbered over 370,000,000 of an estimated value of nearly \$100,000,000. Eleven million of these items were knitted articles given to soldiers and sailors in the United States.

*Post-war Work.*—On March 1 1919, the War Council dissolved and all authority and responsibilities were taken over by the Executive Committee with Dr. Livingston Farrand as chairman. The foreign commissions were gradually closed and withdrawn, although late in 1919 over 1,000 Red Cross workers still remained in Europe. The total membership after the roll-call of Nov. 1919 was about 10,000,000. After the Dec. 1920 roll-call it was about 7,000,000. Relief work was carried on after the war in Albania, Belgium, Bosnia and Herzegovina, Czechoslovakia, France, Great Britain, Greece, Germany, Italy, Montenegro, N. Russia, Palestine, Poland (where more than 100 workers were engaged), Serbia (where 30 doctors, 50 nurses and five dentists worked at various points), S. Russia, Switzerland (caring for American soldier prisoners coming from German prison camps), Siberia (where 600 workers fought against typhus, cholera and other epidemics), and western Russia and the Baltic states. During a part of 1920 operations still continued in most of these countries, but by the end of the year the list had been reduced to Poland, S. Russia, Czechoslovakia, Montenegro, Serbia, the Baltic states, Austria (Vienna), Hungary (Budapest) and Turkey (Constantinople). In Poland 258 hospitals with 26,123 beds were established in 1920. Thirty dispensaries and 207 orphanages were aided, clothing was distributed to over 80,000 children and 2,316 towns with a total population of more than 700,000 were given general relief. In Rumania six hospitals were operated, 322 soup kitchens maintained, and relief supplies provided for 219 schools and 232 orphanages. In western Russia and the Baltic states 300,000 civilian poor, 21,000 refugees and 2,500 war prisoners were helped. In Vienna 98 hospitals were aided. Similar work was done in Budapest. In Siberia the cargoes of 30 American relief ships, and part cargoes of 92 ships from other countries were distributed. Eighteen hospitals were operated and numerous sanitary trains organized and an average of seven articles of clothing was given to each of 387,500 women and 775,000 children. Late in 1920 it was decided to restrict further operations in Europe so far as possible strictly to medical care, and \$5,000,000 was appropriated for this work. Twenty child medical units were put into the field. In America the peace programme of the Red Cross in 1920 contained as its most notable features the further development of its nursing service. Enrolment in this service increased in 1920 from 35,426 to 36,705. The number of Red Cross public health nurses grew from 162 to 908 and the number of women and girls completing the Red Cross course in home hygiene and care of the sick increased during the year from 34,033 to 93,093. There were 57 major disasters in the United States in 1920 which required Red Cross relief. Altogether \$780,000 was expended in this relief. (V. L. K.)

**REDESDALE, ALGERNON BERTRAM FREEMAN-MITFORD,** BARON (1837-1916), British politician and writer (see 22,968), in 1906 accompanied Prince Arthur of Connaught on his mission to Japan to invest the Mikado with the Order of the Garter. In 1915 he published his memoirs. He died at Batsford Park, Glos., Aug. 17 1916. His eldest son was killed in action in May 1915, and he was succeeded as second baron by his second son, David Bertram Ogilvy Freeman-Mitford (b. 1877).

**REDMOND, JOHN EDWARD** (1851-1918), Irish politician (see 22,968\*), obtained for the first time a position of real power in Parliament after the first general election of 1910. After he had amalgamated the two Irish Nationalist parties under his own lead in 1900, he had never hitherto been able, owing to the large Unionist majority of 1900, and the independent Liberal majority of 1906, to hold that balance of power in the House of Commons which had proved such a formidable weapon in the hands first of O'Connell and afterwards of Parnell. But the great reduction of the Liberal forces in Jan. 1910 made it impossible that Mr. Asquith's Government should long continue unless it found favour in Mr. Redmond's eyes. The first use which he made of this new authority was to insist that Mr. Lloyd George's famous budget of 1909, on which the dissolution had turned, but which was in itself not very congenial to the Irish party, should be postponed till after the constitutional resolutions directed against the House of Lords—his one object being to remove the veto of the Upper House, which was the main barrier against Home Rule. This order of procedure was also demanded by the Labour party and by the Radicals; and the Government complied. But Redmond did not trust them completely, and pressed for an assurance that the Royal prerogative would be at the Prime Minister's disposal to overbear any rejection by the Lords of the veto resolutions. He regretted King Edward's

death as being a momentary "check to the onward march of the constitutional struggle," and he was impatient at the constitutional conference which was called early in the new reign in order to endeavour—vainly, as the result proved—to discover a solution by consent. He himself occupied the months of its session by a successful expedition to America to secure sympathy and funds. In spite of a harassing movement on his flank by a small party of Independent Nationalists who had Mr. O'Brien and Mr. Healy as their spokesmen, and who accused him of having sold the Irish vote to the Government, he subsequently conducted a strenuous campaign on behalf of the ministerial programme for the second general election of the year. He denounced the House of Lords as the special enemy of Ireland, and said that this was not only a Home Rule election, but the great Home Rule election. When the result of the polling had confirmed him in his tenure of the balance of Parliamentary power, he forwarded the progress of the Parliament bill in 1911 by the steady vote of his party rather than by speech. In the autumn he was regularly consulted on the details of the forthcoming Home Rule bill, and delivered speeches assuring the English that the Home Rule Parliament would be duly subordinate to the Imperial Parliament, and that the Protestants had nothing to fear from Roman Catholic domination, and assuring the Irish that they would find the provisions of the bill satisfactory. When the bill was introduced in April 1912, he welcomed it in the House on behalf of the Nationalists as a great and adequate measure. He disclaimed Separatism, and said that Irish Separatists, once numerous, were now very few, and would disappear when Home Rule was granted. He went over to Ireland and succeeded in almost silencing adverse Nationalist criticism of details, and procured an enthusiastic acceptance of the bill from a Nationalist convention. His speeches during the passage of the bill through Parliament were of a moderate character and accepted the measure as a final settlement; but, while professing goodwill towards Ulster, he resisted any attempt to take her out of the bill as a mutilation of Ireland. In token of the union of feeling between Nationalists and Liberals, he attended the autumn meeting of the National Liberal Federation at Nottingham in Nov. 1912, and spoke for the first time on the same platform as Mr. Asquith, saying that, on every great item of the Liberal programme, the Nationalists were sincerely with them. When, in the next year, these began to talk, in view of the determined attitude of Ulster, of a settlement by consent between parties, he was very slow to agree and was criticised by the Independent Nationalists for his unconciliatory attitude. He professed himself ready to discuss further safeguards; but he would not go into a conference at which Home Rule would be "put into the melting pot"; Ireland, he said, was a unit, and the two-nations theory an abomination. In a speech at Newcastle-upon-Tyne on Nov. 14, he denounced the passionate opposition of the Unionists and Ulster as "a gigantic game of bluff and blackmail." He would pay a large price for settlement by consent; but it must be consistent with national self-government for Ireland. He constantly insisted that the bill would, under the Parliament Act, automatically become law in 1914. But, in deference to the general feeling, he said in the debate on the Address in that year that he would consider in the broadest and friendliest spirit any proposals for an agreed settlement that the Government might make, though he protested against the idea of an Amending bill. When Mr. Asquith proposed the scheme of provisional exclusion, by county option, for six years, he treated this as the extreme limit of concession, and consequently this was the proposal which the Government embodied in their Amending bill. He absolutely refused to consider the total exclusion of Ulster. He had difficulties with the extremists in Ireland that spring and summer. The enrolment of the Ulster Volunteers had suggested the idea of similar formations in the other three provinces to defend the Nationalist idea; and under the fostering of leaders like Casement and of the rising Sinn Féin organization, these forces had reached large numbers—over 100,000 by the spring of 1914. Their growth had been discouraged by Mr. Redmond and his colleagues;

\* These figures indicate the volume and page number of the previous article.

but he felt it necessary now to obtain control, and, after a somewhat sharp struggle with the extremists, succeeded in doing so in June. At the end of July he took part, in spite of Nationalist criticism, in the abortive Buckingham Palace Conference.

Then came the World War, and in the debate succeeding Sir E. Grey's famous declaration on bank holiday, Aug. 3, Redmond created a profound sensation by a speech in which he declared that the events of recent years had completely altered the Nationalist feeling towards Great Britain. The Government, he said, might withdraw its troops from Ireland, whose coasts would be defended by her own sons, Nationalist Volunteers joining with Ulster Volunteers in the task. This generous attitude was met by the decision of the Government to pass the Home Rule bill into law, suspending its operation till after the war. Redmond took an active part in promoting recruiting in Ireland. He stood on the platform in Dublin Mansion House on Sept. 25 by the side of the Prime Minister and the Lord Lieutenant, and said that Ireland would feel bound in honour to take her place beside the other autonomous portions of the King's dominions. "You have kept faith with Ireland," he said; "Ireland will keep faith with you." Unfortunately, owing partly to the anti-recruiting agitation promoted by Sinn Féin and other extremists, and partly to red tape at the War Office, his efforts were only moderately successful. But he constantly opposed the application of conscription in any shape to Ireland, and in consequence neither of the military service bills of the spring of 1916 applied to that country. He had refused Mr. Asquith's request for his help in office in the Coalition Government of June 1915; and the fact that he stood out, while Sir E. Carson was included, no doubt intensified the smouldering dissatisfaction in southern Ireland, which broke into a blaze in the Dublin Rebellion of Easter 1916. This was a stunning blow to Redmond, who had not realized the growing strength and virulence of the Sinn Féin movement. He expressed in the House of Commons his detestation of the crime, and lent his assistance to the attempt that was made by the Government in the summer through Mr. Lloyd George to arrange an agreed settlement of the whole Irish question. At first it looked as if the negotiations would be successful, on the basis of bringing the Home Rule Act into immediate operation, while excluding the six Ulster counties by an Amending bill which should cover all the period of the war, and a short interval after it. The consent was obtained of all Irish parties, except the southern Unionists; but certain modifications which the Unionists in the Cabinet demanded were treated by the Nationalists as amounting to a breach of faith; and Redmond announced his intention of criticising ministers for their procrastination not only with regard to Ireland but also with regard to the whole conduct of the war. The negotiations having failed, and the Government having restored the ordinary civil administration of Ireland, with Mr. Duke, K.C., a Unionist, as Chief Secretary, Redmond treated this as a fresh outrage on Ireland; and on Oct. 18 he moved a resolution charging ministers with maintaining a system of government in Ireland inconsistent with the principles for which the Allies were fighting in Europe. The result, he said, was that Irish regiments could not be kept up to their full strength, and that his efforts to aid recruiting had been nullified. The motion was, of course, rejected by a large majority. He criticised Mr. Lloyd George's administration in March 1917 on similar lines, and threatened a return by his party to the old obstructionist opposition. In May, however, the Prime Minister suggested among other alternatives that an Irish convention should be assembled for the purpose of producing a scheme of Irish self-government. To this Redmond agreed; and in the convention he played a prominent and conciliatory part, making in particular a favourable impression on the southern Unionists. During its sittings, however, his health failed. He died of heart failure in London on March 6 1918.

In private life, John Redmond was much liked among his friends, but he never went much into society. He was happily married to an Australian lady, Miss Dalton, by whom he had 2 sons and two daughters.

His younger brother, WILLIAM HOEY KEARNEY REDMOND (1861-1917), intended, as a young man, to adopt the army as his profession, and in 1881 he was a lieutenant in the co. Wexford militia battalion of the Royal Irish Regiment. But he resigned his commission to take part in the Land League movement, was imprisoned as a "suspect" in Kilmainham, and went to Australia with his brother to raise funds for the Nationalist agitation. He was returned for Wexford borough in 1883, and sat in Parliament, though for different constituencies, from that time till his death. He was of an ardent and ebullient temper, which resulted in his spending three months in Wexford gaol in 1888 for inciting to resistance to the sheriff, on the occasion of an eviction, and in many agitated scenes at different times in the House of Commons, where, however, he was personally very popular. Like his brother, in the Nationalist split he adhered to Parnell, and also like his brother, on the outbreak of the World War he instantly recognized the duty of Ireland to fling herself into it on the side of the Allies. Though 53 years old, he joined at once the Irish Division, receiving a commission in the Royal Irish Regiment. He was promoted major for services at the front and mentioned in despatches. In his intervals of service he made two thrilling speeches in the House of Commons—one in Dec. 1916, in which he advocated a new Ireland built up out of the war, and declared that Nationalists and Ulstermen came together in the trenches and were friends, and that if they were brought together on the floor of an assembly in Ireland they would be friends too; the other in March 1917, when he besought the House to let the dead past bury its dead, and to make a new start between England and Ireland. He died of wounds in France on June 7 1917.

**REDWOOD, SIR BOVERTON, BART.** (1846-1919), British chemist, was born in London April 26 1846. He was educated at University College school, London, and by the Pharmaceutical Society, specialized in the study of petroleum and became in 1869 secretary to the Petroleum Association. In this connexion he gave evidence before a select committee of the House of Lords, and his investigations throughout Europe and America qualified him to be the adviser of the Government as to the best use of petrol and oil fuel both before and during the World War. He founded the Institution of Petroleum Technologists and became its first president. He was knighted in 1905 and created a baronet in 1911. He died in London June 4 1919.

**REHAN, ADA** (1860-1916), American actress (*see* 23.48), died in New York City Jan. 8 1916.

**REID, SIR GEORGE** (1841-1913), British painter (*see* 23.50), died at Oakhill, Som., Feb. 9 1913.

**REID, SIR GEORGE HOUSTOUN** (1845-1918), Australian statesman, was born at Johnstone, Renfrewshire, Feb. 25 1845. His father, a Presbyterian minister, emigrated to Australia seven years later, and the boy was therefore Australian by education though not by birth. At the age of 13 he became a junior clerk in a business house in Sydney, but later entered the N.S.W. civil service and began to read for the bar, being finally called in 1879. Politics attracted him more than law, and in 1880 he was elected member for E. Sydney, together with Sir Henry Parkes but above him in the poll. He stood as a free trader, a policy to which he adhered throughout his political career, and with one short break (1884-5) he represented E. Sydney in the N.S.W. Legislature until 1901 when he was elected its representative in the Federal Parliament. He first held office in N.S.W. for a brief period in 1883-4 as Minister of Public Instruction. In 1894 he became its Premier and during his term of office (1894-9) introduced reforms into the civil service and represented the Colony at Queen Victoria's Diamond Jubilee. He did much to promote Federation and from 1901-9 led the free-trade party in the Federal Parliament, becoming Premier for a short period (1904-5) but being for the most part leader of the Opposition. When the Act to constitute an Australian High Commissionership was passed in 1909 Sir George Reid became the first High Commissioner and was created K.C.M.G. He represented his country in London in genial fashion until 1916, and at the end of his term of office

stood for the British House of Commons and was elected for the St. George's Hanover Square division of London Jan. 1916. He was created G.C.M.G. in 1911 and G.C.B. in 1916. He published *My Reminiscences* (1917), as well as *Five Free Trade Essays* (1875), and other economic papers. He died suddenly in London, Sept. 12 1918.

**REID, WHITELAW** (1837-1912), American journalist and diplomatist (see 23.52), died in London Dec. 15 1912. His last public address was delivered before the students of the University College of Wales, Aberystwyth, on "Thomas Jefferson." In 1912 appeared *The Scot in America* and the *Ulster Scot* and posthumously, in 1913, *American and English Studies*.

See Royal Cortissoz, *The Life of Whitelaw Reid* (1921).

**REINACH, JOSEPH** (1856-1921), French author and politician (see 23.55), was not reflected to the Chamber of Deputies in 1914. During the World War his series of articles, "Les Commentaires de Polybe," in the *Figaro*, were remarkable for their clear vision. He died April 18 1921.

**REJANE, GABRIELLE** [CHARLOTTE RÉJU] (1857-1920), French actress (see 23.58), died in Paris June 14 1920. During the World War she visited England and appeared at the Court theatre, London, in a patriotic play, *Alsace*, and at the Coliseum in *The Bel*, when she played the part of a Frenchwoman visiting the English battle-zone. She was made Chevalier of the Legion of Honour for her war services.

**RELATIVITY**.—The progress of physical science during the decade 1910-20 was specially remarkable for the definite emergence into general public discussion of the principle of Relativity, as expounded by Prof. Albert Einstein, professor of Physics in the Kaiser Wilhelm Institut, Berlin. Its meaning and its history as part of present-day physical theory are discussed below.

*Introduction*.—The primary aim of the investigator in pure science is the discovery of natural laws. As a secondary and hardly less important aim, he tries to invent a mechanism which shall account for the laws already known. The secondary aim is forced upon him partly by the constitution of the human mind; our intellects, unsatisfied with a mere accumulation of facts, impel us ever to search for the causes underlying the facts: *Vere scire est per causas scire*. But to the working scientist the discovery of a mechanism has an additional and more practical value. When he has found a mechanism which will account for certain laws, he can proceed to examine the complete set of laws which the mechanism demands. If his mechanism corresponds with sufficient closeness to reality he may in this way be led to the discovery of new natural laws. On the other hand, the new laws deduced from the supposed mechanism may be false. If the falsity of the new laws is not at once revealed science may for a time be led into wrong paths. When more accurate experimenting or observation discloses that the laws are not true, a recasting of ideas becomes necessary, and the branch of science concerned may experience a time of revolution followed by a period of rapid growth.

An obvious illustration of these general statements is provided by the history of astronomy. The laws of the motions of the planets, as observed from the earth, were tolerably well known to the Greeks. They had also evolved an explanatory mechanism, starting from the metaphysical premise that the paths of the planets must necessarily be circles. The earth was the centre of the universe and round this revolved spheres to which the planets were attached. To explain the retrograde motion of the outer planets, these were supposed attached to secondary spheres revolving about points on the primary spheres which in turn revolved about the earth. This mechanism of cycles and epicycles held the field as an explanation of planetary motion for eighteen centuries. Finally the observations of Tycho Brahe provided a test which revealed the falsity of the whole structure. The position of Mars was found to differ from that required by the mechanism of epicycles by an amount as great as eight minutes of arc. "Out of these eight minutes," said Kepler, "we will construct a new theory that will explain the motions of all the planets."

The history of the succeeding century of astronomy need not be recapitulated here (see 2.811). The earth yielded its place as the centre of the universe, and the structure of cycles and epicycles crumbled away. The laws of planetary motion were determined with a precision which for the time appeared to be final. The mechanism underlying these laws was supposed to be a "force" of gravitation. This force was supposed to act between every pair of particles in the universe, its intensity varying directly as the product of the masses of the particles and inversely as the square of the distance separating them—the famous law of Newton.

In science, history repeats itself. Recent years have provided a further instance of the general processes we have been considering. Under the Newtonian mechanism every planet would describe a perfect ellipse about the sun as focus, and these elliptic orbits would repeat themselves indefinitely except in so far as they were disturbed by the gravitational forces arising from the other planets. But, after allowing for these disturbing influences, Leverrier found that the orbit of the planet Mercury was rotating in its own plane at the rate of 43 seconds a century. Various attempts have been made to reconcile this observed motion with the Newtonian mechanism. The gravitational forces arising from the known planets were demonstrably unable to produce the motion in question, but it was possible that Mercury's orbit was being disturbed by matter so far unknown to us. Investigations were made as to the disturbance to be expected from various hypothetical gravitating masses—a planet, or a ring of planets, between Mercury and the sun, a ring of planets outside the orbit of Mercury, a belt of matter extended in a flattened disc in a plane through the sun's centre, an oblateness, greater than that suggested by the shape of the sun's surface, in the arrangement of the internal layers of the sun's mass. In every case the mass required to produce the observed disturbance in the motion of Mercury would have also produced disturbances not observed in the motions of the other planets. The solution of the problem came only with the theory of relativity. Just as Tycho's eight minutes of arc, in the hands of Kepler and Newton, revolutionized mediaeval conceptions of the mechanism of the universe, so Leverrier's 43 seconds of arc, in the hands of Einstein, has revolutionized our 19th-century conceptions, not only of purely astronomical mechanism, but also of the nature of time and space and of the fundamental ideas of science. The history of this revolution is in effect the history of the theory of relativity. It falls naturally into two chapters, the first narrating the building of an earlier physical theory of relativity, and the second dealing with its extension to gravitation.

*The Physical Theory of Relativity*.—The earliest successful attempt to formulate the laws governing the general motion of matter is found in Newton's laws. The first law states that—

"Every body perseveres in its state of rest or of uniform motion in a right line unless it is compelled to change that state by forces impressed thereon."

In this law no distinction is made between rest and uniform motion in a straight line, and the same is true of the remaining laws. Hence follows the remarkable property to which Newton draws explicit attention in his fifth corollary to the laws of motion:—

"The motions of bodies included in a given space are the same among themselves, whether that space is at rest, or moves uniformly forwards in a right line without any circular motion."

As a concrete application of this principle, Newton instances "the experiment of a ship, where all motions happen after the same manner whether the ship is at rest or is carried uniformly forward in a right line." Just as a passenger on a ship in a still sea could not determine, from the behaviour of bodies inside the ship, whether the ship was at rest or moving uniformly forward, so we cannot determine from the behaviour of bodies on our earth whether the earth is at rest or not. We believe the earth to be moving round the sun with a speed of about 30 km. a second, so that there can be no question of the earth being permanently at rest, but we are unable to determine whether

it is at rest at any specified point of its orbit, or, in the probable event of its not being at rest, what its absolute velocity may be. There is no more reason for thinking the sun, than the earth, to be at rest. Newton wrote as follows:—

"It is possible that in the remote regions of the fixed stars, or perhaps far beyond them, there may be some body absolutely at rest, but impossible to know, from the positions of bodies to one another in our regions, whether any of these do keep the same position to that remote body. It follows that absolute rest cannot be determined from the position of bodies in our regions."

The above quotations are all from the first book of the *Principia Mathematica*. Previous to them all Newton writes: "I have no regard in this place to a medium, if any such there is, that freely pervades the interstices between the parts of bodies." The two centuries which elapsed after the publication of the *Principia* witnessed a steady growth of the belief in the reality of such an all-pervading medium. It was called the aether, and by the end of these two centuries (1887) it was almost universally believed that light and all electromagnetic phenomena were evidence of actions taking place in this aether. Light from the most distant stars was supposed to be transmitted to us in the form of wave motions in the aether, and we could see the stars only because the sea of aether between us and these stars was unbroken. It had been proved that if this sea of aether existed it must be at rest, for the alternative hypothesis that the aether was dragged about by ponderable bodies in their motions had been shown to be incompatible with the observed phenomenon of astronomical aberration and other facts of nature (see 1.292). On this view it was no longer necessary to go to Newton's "remote regions of the fixed stars, or perhaps far beyond them," to find absolute rest. A standard of absolute rest was provided by the aether which filled our laboratories and pervaded all bodies. Owing to our motion it would appear to be rushing past us, although without encountering any hindrance—"like the wind through a grove of trees," to borrow the simile of Thomas Young. The determination of the absolute velocity of the earth was reduced to the problem of measuring the velocity of an aether current flowing past us and through us.

In this same year (1887) the first experimental determination of this velocity was attempted by the Chicago physicist A. A. Michelson. The velocity of light was known to be, in round numbers, 300,000 km. a second, a velocity which was believed to represent the rate of progress of wave motion through the aether. If the earth were moving through the aether with a velocity of 1,000 km. a second, the velocity of light relative to a terrestrial observer ought to be only 299,000 km. a second when the light was sent in exactly the direction of the earth's motion through the aether, but would be 301,000 km. a second if the light was sent in the opposite direction. In more general terms, if the earth were moving through the aether, the velocity of light, as measured by a terrestrial observer, would depend on the direction of the light, and the extent of this dependence would give a measure of the earth's velocity. The velocity of light along a single straight course does not permit of direct experimental determination, but the same property of dependence on direction ought to be true, although to a less extent, of the average to-and-fro velocity of a beam of light sent along any path and then reflected back along the same path.

It was through this property that Michelson attempted to measure the earth's velocity through the aether.

The apparatus was simple in principle. A circular table ABCD was arranged so as to be capable of slow rotation about its centre O. Light sent along CO was divided up at O into two beams which were made to travel along perpendicular radii OA, OB. The arms OA, OB were made as equal as possible and mirrors were placed at A and B to reflect the beams of light back to O. An extremely slight difference in the times of the total paths of the two beams from O back to O. There would in any case be a difference owing to the necessarily imperfect equalization of the lengths of the arms OA, OB, but if the earth is moving through the aether in some direction OP, and if the table is made to rotate slowly about O, then this difference ought itself to vary on account of the earth's motion through the aether. Michelson, and afterwards Michelson and Morley in collaboration, attempted to estimate the amount of this variation.

No variation whatsoever could be detected, although their final apparatus was so sensitive that the variation produced by a velocity through the aether of even 1 km. a second ought to have shown itself quite clearly.

Thus to the question "What is our velocity through the aether?" Nature appeared to give the answer "None." It was never suggested that this answer should be accepted as final; it would have brought us back to a geocentric universe. Clearly either the question had been wrongly framed or the answer wrongly interpreted. It was pointed out in 1893 by Fitzgerald, and again, independently, in 1895, by Lorentz, that the null result of the Michelson-Morley experiment could be explained if it could be supposed that motion through the aether altered the linear dimensions of bodies.

FIG. 1.

FIG. 2.

To be explicit, it was found that the experiment would invariably and of necessity give a null result if it was supposed that every body moving through the aether with a velocity  $u$  was contracted

in the direction of its motion in the ratio  $\sqrt{1 - \frac{u^2}{c^2}}$ ,  $c$  being the velocity of light. The supposition that such a contraction occurred was not only permissible—it was almost demanded by electrical theory. For Lorentz had already shown that if matter were a purely electrical structure, the constituent parts would of necessity readjust their relative positions when set in motion through the aether and the final position of equilibrium would be one showing precisely the contraction just mentioned.

On this view, there was no *prima-facie* necessity to abandon the attempt to measure the earth's velocity through the aether. The answer to the problem had merely been pushed one stage farther back, and it now became necessary only to measure the shrinkage of matter produced by motion. It was obvious from the first that no direct material measurement could disclose the amount of this shrinkage, since any measuring rod would shrink in exactly the same ratio as the length to be measured; but optical and electrical methods appeared to be available. Experiments to this end were devised and performed by Rayleigh, Brace, Trouton and Noble, Trouton and Rankine and others. In every case a null result was obtained. It appeared then that if the earth moved through the aether this motion was concealed by a universal shrinkage of matter, and this shrinkage was in turn concealed by some other agency or agencies whose wit, so far, appeared to be greater than that of man.

At this time the word "conspiracy" found its way into the technical language of science. There was supposed to be a conspiracy on the part of the various agencies of nature to prevent man from measuring his velocity of motion in space. If this motion produced a direct effect  $x$  on any phenomenon, the other agencies of nature seemed to be in league to produce a countervailing effect  $-x$ . A long train of experiments had not revealed, as was intended, our velocity through the aether; they had merely created a conviction that it was beyond the power of man to measure this velocity. The conspiracy, if such there was, appeared to have been perfectly organized.

A perfectly organized conspiracy of this kind differs only in name from a law of nature. To the inventor who tries to devise a perpetual-motion machine it may well appear that the forces of nature have joined in a conspiracy to prevent his machine from working, but wider knowledge shows that he is in conflict not with a conspiracy, but with a law of nature—the conservation of energy. In 1905 Einstein, crystallizing an idea which must

have been vaguely present in many minds, propounded the hypothesis that the apparent conspiracy might be in effect a law of nature. He suggested, tentatively, that there might be a true law to the effect that "it is of necessity impossible to determine absolute motion by any experiment whatever." This hypothetical law may again be put in the equivalent form: "The phenomena of nature will be the same to two observers who move with any uniform velocity whatever relative to one another." This may be called the hypothesis of relativity.

The hypothesis in itself was not of a sensational character. Indeed, from the quotations which have already been given from Newton's works, it appears probable that Newton himself would have accepted the hypothesis without hesitation: he might even have regarded it as superfluous. The true significance of the hypothesis can only be understood by a reference to the scientific history of the two centuries which had elapsed since Newton. The Newtonian view that absolute rest was to be found only "in the remote regions of the fixed stars, or perhaps far beyond them," had given place to a belief that absolute rest was to be found all around us in an aether which permeated all bodies. What was striking about the hypothesis was its implication—either that we could not measure the velocity relative to ourselves of a medium which surrounded us on all sides, or else that no such medium existed.

The hypothesis demanded detailed and exhaustive examination. It was for the mathematician to test whether the hypothesis was in opposition to known and established laws of physics, and to this task Einstein, Lorentz and others set themselves. If a single firmly established law proved to be in opposition to the hypothesis, then of course the hypothesis would require to be abandoned. It was unlikely that such an event would occur among the well-established laws, for if it did, the phenomena governed by that law would enable direct measurement to be made of the earth's velocity through the aether, a measurement which had so far eluded all attempts of experimenters. It was among the more obscure and less well-established laws, if anywhere, that discrepancies were to be looked for.

It is impossible here to give a complete account of the many tests to which the relativity hypothesis has been subjected. The result of all can be summed up in one concise and quite general statement:—Wherever the hypothesis of relativity has appeared to be in conflict with known or suspected natural laws, further experiment, where possible, has, without a single exception, shown the laws to be erroneous, and has moreover shown the alternative laws suggested by the hypothesis of relativity to be accurate. It is only in somewhat exceptional cases that the hypothesis of relativity of itself suffices to determine fully the form of a natural law; these cases constitute the most striking triumphs of the theory. As instances may be mentioned the determination of the law connecting the mass of an electron with its velocity; of the law expressing the velocity of light through a transparent medium in motion (Fizeau's water-tube experiment); and of the formulae for the magnetic forces on moving dielectric media (experiments of Eichenwald and H. A. Wilson).<sup>1</sup>

Before passing on from the general statement which has been made, particular mention must be made of one special case. A natural law which was at an early stage seen to be in conflict with the hypothesis of relativity was Newton's famous law of gravitation—namely, that every particle of matter attracts every other particle with a force proportional to the product of the two masses, and to the inverse square of their distance apart. Either, then, Newton's great law had to be abandoned, or else the hypothesis of relativity had to be discarded, in which case it would immediately become possible, in theory at least, to determine the earth's velocity through space by gravitational means. It is the choice between these two alternatives that has led to the most surprising developments of the theory of relativity; and to these we shall return later.

<sup>1</sup> For references to the original papers dealing with these and other tests of the hypothesis of relativity see Cunningham, *The Principle of Relativity*, or J. H. Jeans, *Mathematical Theory of Electricity and Magnetism* (4th ed.).

*Space and Time.*—The hypothesis of relativity, as has already been explained, postulates that the phenomena of nature will be the same to any two observers who move relative to one another with any uniform velocity whatever. The hypothesis has been so amply tested as regards all optical and electromagnetic phenomena that no doubt is felt, or can rationally be felt, as to its truth with respect to these phenomena. The hypothesis can be examined and developed in two opposite directions. We may, on the one hand, proceed from the general hypothesis to the detailed laws implied in it; this has already been done, with completely satisfactory results as regards confirmation of the hypothesis. Or we may regard the hypothesis of relativity as being itself a detailed law and attempt to generalize upward to something still wider. It is this possibility which must for the moment claim our attention.

In 1905 Einstein examined in full the consequences of the hypothesis that one simple optical phenomenon—namely, the transmission of a ray of light in free space—was, in accordance with the hypothesis of relativity, independent of the velocity of the observer. If an aether existed, and provided a fixed framework of reference, then light set free at any instant would obviously travel with a velocity which would appear to an observer at rest in this aether to be the same in all directions, and the wave front at any instant would be a sphere having the observer as centre. On the hypothesis of relativity the phenomenon of light transmission must remain unaffected by the motion of the observer, so that the light must appear to a moving observer also, to travel with a uniform velocity in all directions, and thus to the moving observer also the wave front must appear to be a sphere of which he will be the centre. It is, however, quite obvious that the same spherical wave front cannot appear to each of two observers who have moved some distance apart to be centred round himself, unless the use either of the common conceptions of science or of the ordinary words of language is greatly changed. In fig. 2 it is not possible in ordinary language that both O and P should at the same instant be at the centre of the sphere A B C. The change to which Einstein was forced is one which has an intimate bearing upon our fundamental conceptions of the nature of space and time; this change it will be necessary to explain in some detail.

Suppose that two observatories, say Greenwich and Paris, wish to synchronize their clocks, with a view to, let us say, an exact determination of their longitude difference. Paris will send out a wireless signal at exact midnight as shown by the Paris clock, and Greenwich will note the time shown by the Greenwich clock at the instant of receipt of the signal. Greenwich will not, however, adjust their clock so as to show exact midnight when the signal is received; a correction of about .001 second must be made to allow for the time occupied by the signal in traversing the distance from Paris to Greenwich. To turn to mathematical symbols, if  $t_0$  is the time at which a signal is sent out from one station, the time of receipt at a second station is taken to be  $t_0 + \frac{x}{c}$ , where  $x$  is their distance apart, and  $c$  is the velocity of light. This represents the ordinary practice of astronomers, but it is clear that if the earth is travelling through a fixed aether with a velocity  $u$  in the direction of the line joining the two observatories, the velocity of transmission of the signal relative to the two observatories will not be  $c$  but  $c+u$ , and the time of receipt at the second station will be  $t_0 + \frac{x}{c+u}$ . Thus it appears that it is impossible to synchronize two clocks unless we know the value of  $u$ , and that the ordinary practice of astronomers will not, as they expect, synchronize their clocks, but set them at an interval apart equal to

$$x \left( \frac{1}{c} - \frac{1}{c+u} \right)$$

which may, to an approximation, be put equal to  $\frac{ux}{c^2}$ .

According to the hypothesis of relativity, it is impossible ever to determine the value of  $u$ , and so is impossible ever truly

to synchronize two clocks. Moreover, according to this hypothesis, the phenomena of nature go on just the same whatever the value of  $u$ , so that the want of synchrony cannot in any way show itself—in fact, if it did, it would immediately become possible to measure the effect and so arrange for true synchrony.

As the earth moves in its orbit, the value of  $u$  changes, so that its value in the spring, for instance, will be different from its value in the autumn. One pair of astronomers may attempt to synchronize a pair of clocks in the spring, but their synchronization will appear faulty to a second pair who repeat the determination in the autumn. There will, so to speak, be one synchrony for the spring and another for the autumn, and neither pair of astronomers will be able to claim that their results are more accurate than those of their colleagues. More generally we may say that different conceptions of synchrony will correspond to different velocities of translation.

These elementary considerations bring us to the heart of the problem which we illustrated diagrammatically in fig. 2. The observer at O in the diagram will have one conception of simultaneity, while the second observer who moves from O to P will, on account of his different velocity, have a different conception of simultaneity. The instants at which the wave front of the light signal from O reaches the points A, B, C in the diagram will be deemed to be simultaneous by the observer who remains at O, but the observer who moves from O to P will quite unconsciously have different ideas as to simultaneity. At instants which he regards as simultaneous the wave front will have some form other than that of the sphere ABC surrounding O. If the hypothesis of relativity is to be true in its application to the transmission of light signals, this wave front must be a sphere having P as its centre.

Einstein examined mathematically the conditions that this should be possible. Unfortunately a precise statement of his conclusions can only be given in mathematical language.

The observer who is supposed to remain at O in fig. 2 may be supposed to make exact observations and to record these observations in mathematical terms. To fix the positions of points in space he will map out a "frame of reference" consisting of three orthogonal axes, and use Cartesian coördinates  $x, y, z$ , to specify the projections along these axes of the radius from the origin to any given point. He will also use a time coördinate  $t$  which may be supposed to specify the time which has lapsed since a given instant, as measured by a clock in his possession. Any observations he may make on the transmission of light signals can be recorded in the form of equations between the four coördinates  $x, y, z, t$ . For instance, the circumstance that light travels from the origin with the same velocity  $c$  in all directions will be expressed by the equation (of the wave front):—

$$x^2 + y^2 + z^2 - c^2 t^2 = 0, \quad \dots \quad (1)$$

The second observer who moves from O to P will also construct a frame of reference, and we can simplify the problem by supposing that his axes are parallel to those already selected by the first observer. His coördinates, to distinguish them from those used by the first observer, may be denoted by the accented letters  $x', y', z', t'$ . If his observations also are to show light always to travel with the same velocity  $c$  in all directions, the equation of the wave front, as observed by him, must be:—

$$x'^2 + y'^2 + z'^2 - c'^2 t'^2 = 0, \quad \dots \quad (2)$$

A 19th-century mathematician would have insisted that  $x, y, z, t$  must be connected with  $x', y', z', t'$  by the simple relations:—

$$\left. \begin{aligned} x' &= x - ut \\ y' &= y \\ z' &= z \\ t' &= t \end{aligned} \right\} \quad \dots \quad (A)$$

but it is obvious that if these relations hold, then equation (1) cannot transform into equation (2). Einstein finds that equation (1) will transform into equation (2) provided the coördinates  $x, y, z, t$  of the first observer are connected with the coördinates  $x', y', z', t'$  of the second observer by the equations:—

$$\left. \begin{aligned} x' &= \beta (x - ut) \\ y' &= y \\ z' &= z \\ t' &= \beta \left( t - \frac{ux}{c^2} \right) \end{aligned} \right\} \quad \dots \quad (B)$$

where  $\beta$  stands for  $\left(1 - \frac{u^2}{c^2}\right)^{-\frac{1}{2}}$

To form some idea of the physical meaning of these equations, it will be advantageous to consider the simple case in which the first observer is at rest in the aether while the second moves through the aether with velocity  $u$ . The points of difference between equations (B) and (A) then admit of simple explanation. The factor  $\beta$  in the first of equations (B) is simply, according to the suggestion of Fitzgerald and Lorentz already mentioned, the factor according to which all lengths parallel to the axis of  $x$  must be adjusted on account of motion through the aether with velocity  $u$ . The moving observer must correct his lengths by this factor, and he must correct his times by the same factor in order that the velocity of propagation of light along the axis of  $x$  may still have the same velocity  $c$ ; this explains this presence of the multiplier  $\beta$  in the last of equations (B). The one remaining difference between the two sets of equations, namely the replacement of  $t$  in (A) by  $t - \frac{ux}{c^2}$  in (B), represents exactly the

want of synchrony which, as we have already seen, is to be expected in the observations of two observers whose velocity differs by a velocity  $u$ .

Although the equations admit of simple illustration by considering the case in which one observer is at rest in a supposed aether, it will be understood that the equations are more general than the illustration. They are in no way concerned with the possibility of an observer being at rest in an aether, or indeed with the existence of an aether at all. Their general interpretation is this: If one observer O, having any motion whatever, finds, as a matter of observation, that light for him travels uniformly in all directions with a constant velocity  $c$ , then a second observer P, moving relative to O with a constant velocity  $u$  along the axis of  $x$ , will find, as a matter of observation, that light, for him also, travels uniformly in all directions with the same constant velocity  $c$ , provided he uses, for his observations, coördinates which are connected with the coördinates of O by equations (B).

This is the meaning that was attached to the equations by Einstein in 1905, but the equations had been familiar to mathematicians before this date. They had in fact been discovered by Lorentz in 1895 as expressing the condition that all electromagnetic phenomena, including of course the propagation of light, should be the same for an observer moving through the aether with velocity  $u$  as for an observer at rest in the aether. For this reason the transformation of coördinates specified by these equations is universally spoken of as a "Lorentz transformation." What Einstein introduced in 1905 was not a new system of equations but a new interpretation of old equations. The two observers who used the coördinates  $x, y, z, t$  and  $x', y', z', t'$  had been regarded by Lorentz as being one at rest in an aether and one in motion with a velocity  $u$ ; for Einstein they were observers moving with any velocities whatever subject to their relative velocity being  $u$ . Lorentz had regarded  $t$  as the true time and  $t'$  as an artificial time. If the observer could be persuaded to measure time in this artificial way, setting his clocks wrong to begin with and then making them gain or lose permanently, the effect of his supposed artificiality would just counterbalance the effects of his motion through the aether. With Einstein came the conception that both times,  $t$  and  $t'$ , had precisely equal rights to be regarded as the true time. The measure  $t'$  is precisely that which would be adopted naturally by any set of observers, or race of men, who disregarded their steady motion through space; their adoption of it would be above criticism if, as Einstein suggested, their motion through space had no influence on material phenomena, and it represents, as we have seen, the usual practice of astronomers in comparing time at different places. From this point of view,

neither measure of time is more accurate or more logical than the other. There are as many ways of measuring time as there are observers, and all are right.

The investigator who is trying to discover laws of nature will, in general, require to measure either directly or indirectly both time and space. If, to take a simple case, he is studying the motion of a single particle, he will measure out the position of the particle at definite instants as determined by his clock. He may specify the position of the particle at any instant by three measurements in space—for instance, he may say that two seconds after his particle started it was 6 ft. to the E. of the point from which it started, 9 ft. to the N. and 12 ft. vertically upward. The mathematician would express this by taking axes  $x$ ,  $y$ ,  $z$  to the E., to the N. and vertically upwards, and saying that at time  $t=2$  the particle had coördinates  $x=6$ ,  $y=9$ ,  $z=12$ . Or he might, putting his time coördinate  $t$  on the same footing as the space coördinates  $x$ ,  $y$ ,  $z$ , simply say that  $x=6$ ,  $y=9$ ,  $z=12$ ,  $t=2$  represented one position of the particle. A complete set of readings of this type, each consisting of values of four coördinates, would give the complete history of the motion of the particle.

Such sets of simultaneous measurements form the common material of investigations in both pure and applied science. For instance, the engineer may measure the extension of a sample of steel corresponding to different loads; the electrician may measure the amount of light given by an electric filament corresponding to different amounts of current passed through it. In each of these cases there are only two quantities to be measured simultaneously, and an investigator can conveniently represent the result of the whole series of his measurements in graphical form; a single reading is represented by a point whose distances from two fixed perpendicular lines represent the quantities measured, and the curve obtained by joining these single points will give all the information contained in the whole set of readings.

We have seen that, in studying the motion of a particle in space, four sets of quantities must be measured, so that the results obtained cannot be plotted graphically on a piece of paper. Their proper representation demands a four-dimensional space, in which  $x$ ,  $y$ ,  $z$  and  $t$  are taken as coördinates. The practical importance of such graphical representation is *nil*, since it is impossible to construct a four-dimensional graph, but its theoretical importance to the theory of relativity is immense. For if the hypothesis of relativity is true, then the four-dimensional graphs of any natural event constructed by all observers, no matter what their relative motions, will be identical. The influence of their motion will be shown only in that the axes of  $x$ ,  $y$ ,  $z$  and  $t$  will be different for different observers, and the relations between these sets of axes will be those given by the foregoing equations (B).

The importance of this conception can hardly be overestimated, and it may be well to consider it further with the help of an illustrative example. Imagine a number of aeroplanes flying over England, and, in order to eliminate one of the three directions in space—the vertical—let us limit them to fly always at the same height, say 1,000 ft. above sea-level. Imagine a number of similar plates of glass prepared, each marked faintly with an outline map of England and with lines of latitude and longitude. Suppose that at 12 h. o.m. G.M.T. a plate is taken and the position of each aeroplane marked by a thick black dot. At 12 h. 1 m. let a second plate be taken and similarly marked, and let this be done every minute for an hour. The 60 plates so marked will constitute a record of the motion of each aeroplane within this hour. If, now, we place the plates in order, one above the other, on a horizontal table, the mass of glass so formed will present a graphical representation, in three dimensions, of the motions of all the aeroplanes. In this graph the two horizontal coördinates represent motions in any two rectangular directions over England, say E. and N., while the third coördinate—the vertical—represents time. The individual black dots which represent the positions of any one aeroplane will form a dotted curve, and this curve gives a graphical representation of the

motion of the particular aeroplane. Our rectangle of glass contains the history, for one hour, of all the aeroplanes in graphical form.

To represent the motion of particles in the whole world of space a four-dimensional graph is required. The four-dimensional space in which it is constructed may, following the usual terminology, be spoken of as a four-dimensional continuum. The history of any particle in the universe—just as that of any aeroplane flying over England—will be represented by a continuous line in the continuum, and this is called the “world line” of the particle. If the hypothesis of relativity is true the same continuum and the same world lines will represent the history of the particles of the universe equally well for all observers, the influence of their motions being shown only through their choosing different axes in the continuum for their axes of space and time. Thus the continuum must be thought of as something real and objective, but the choice of axes is subjective and will vary with the observer, the relation between different choices being expressed mathematically by our equations (B), the equations of the Lorentz transformation. An inspection of these equations shows that the sets of axes chosen by different observers have different orientations in the continuum, so that what one observer describes as a pure space interval will appear to another to be a mixture of time and space.

The instant of time and point in space at which any event occurs can be fixed by a single point in the continuum, so that the interval between two events will be represented by a finite line. The events and the interval between them are absolute, but the interval will be split up into time and space in different ways by different observers. The interval between any two events, such as the great fire of London and the outburst on the star Nova Persei, may be measured by one set of observers as so many years and so many millions of miles, but another set of observers may divide the interval quite differently. For instance a terrestrial astronomer may reckon that the outburst on Nova Persei occurred a century before the great fire of London, but an astronomer on the Nova may reckon with equal accuracy that the great fire occurred a century before the outburst on the Nova. A third astronomer may insist that the events were simultaneous. All will be equally right, although none will be right in an absolute sense. At this stage we may notice one respect in which our pile of glass plates failed to represent the true continuum. The mass of glass was stratified into different plates which represent different times for one particular observer. To obtain a section which would represent what an observer in motion relative to this first observer could regard as simultaneous positions of the aeroplanes, we should have to cut the mass of glass on the slant. The continuum is more closely represented by our plates of glass if they are annealed into a solid mass from which all trace of the original stratification is made to disappear. All observers, no matter what their motion, are then equally free to cut a section to represent their individual ideas of simultaneity.

Thus space and time fade into subjective conceptions, just as subjective as right hand or left hand, front and behind, are in ordinary life. The continuum alone is objective and may be thought of as containing an objective record of the motion of every particle of the universe. The curve in which this record is embodied is spoken of as the world line of the particle in question. To use the words of Minkowski: “Space in itself and time in itself sink to mere shadows, and only a kind of union of the two retains an independent existence.”

*Gravitation and Relativity.*—Since all the phenomena of light and of electromagnetism are believed, on almost incontrovertible evidence, to be in accordance with the hypothesis of relativity, it is necessarily impossible to determine absolute velocity by optical or gravitational means. On the other hand, as we have already mentioned, the Newtonian law of gravitation is readily seen to be inconsistent with the hypothesis of relativity. Three alternatives are open:—

(i.) The Newtonian law may be true, in which case it must be possible to determine absolute velocity by gravitational means.

(ii.) The Newtonian law may be untrue in its original form, but may become true when amended so as to conform to the relativity hypothesis.

(iii.) Neither of the foregoing possibilities may be true.

Alternative (i.) was explored by Sir Oliver Lodge, who, assuming the exact truth of the Newtonian law of gravitation, deduced that the observed motion of the perihelion of Mercury could be accounted for if the sun were moving through space with a velocity of about 70 km. a second in a certain direction. This investigation had to be abandoned when it was shown by Eddington that a similar discussion of the motions of the other planets would lead to vastly different values for the sun's velocity. Alternative (ii.) was explored by Einstein and others, but was found to lead to a motion of the perihelion of Mercury equal only to one-sixth part of that actually observed.

Alternative (iii.) remained with its innumerable possibilities. Einstein commenced his attack on the problem by eliminating all possibilities which did not conform to two general principles. The first of these was the principle of relativity. Inasmuch as all physical phenomena except gravitation were believed to conform to this principle, it was natural to try, as a working hypothesis, the effect of assuming gravitation also to conform. The second principle was the so-called principle of equivalence, and this demands a word of explanation.

To our children we explain that an apple falls to the ground because a force of gravitation inherent in the earth's mass impels the apple towards the centre of the earth. Most schoolboys know that this is not quite the whole story; the path of the apple is more accurately determined by supposing the apple to be acted on simultaneously by two forces—a gravitational force of attraction towards the earth's centre and the centrifugal force arising from the earth's rotation. It is only because the earth's rotation is comparatively slow that the conception of an attraction towards the earth's centre gives a tolerably plausible account of the fall of the apple. If the earth rotated at 17 times its present rate objects would not fall, even approximately, towards the earth's centre; they would fall always parallel to the earth's axis, and the inhabitants of the northern hemisphere might explain this as arising from a force of repulsion inherent in the pole star. If the earth rotated many times faster even than this, bodies would fall always perpendicularly away from the earth's axis, and this might be interpreted as arising from a gravitational repulsion residing in the earth's axis.

These illustrations show that it is easy to confuse acceleration arising from the earth's rotation with gravitational attraction. We may go further and say that it is impossible to distinguish between the effects of gravitational attraction and the effects of acceleration of any kind whatever. Every aeroplanist knows this to his sorrow; it is inherently impossible to devise any instrument which shall show the direction of the vertical in an aeroplane, since an acceleration of the aeroplane produces on any instrument whatever, effects which are indistinguishable from those of gravity. From such considerations Einstein was led to his principle of equivalence, which may be enunciated as follows:—

"A gravitational field of force at any point of space is in every way equivalent to an artificial field of force resulting from acceleration, so that no experiment can possibly distinguish between them."

Guided by these two principles—relativity and equivalence—Einstein was led to the view that all gravitational "fields of force" must be illusions. The apparent "force" arises solely from acceleration and there is no other kind of gravitational force at all. In this statement, as in the statement of the principle of equivalence above, the word acceleration is used in its widest sense. Acceleration results not only from change in the amount of a velocity, but from a change in its direction also. For instance a motor-cyclist riding in a circle at a uniform speed of 60 miles an hour will be the subject of an acceleration towards the centre of the circle. He knows that the apparent force so produced is just as real in its effects as gravitation, and to save himself from falling as a result of its influence he must incline the direction of his machine to the vertical.

It is clear that the acceleration or curvature of path which figures as gravitation cannot be an acceleration or curvature in ordinary three-dimensional space. Before the apple starts to fall from the tree there is neither acceleration nor curvature, and yet the apple is undoubtedly acted on by gravitation. Moreover, this three-dimensional space is, as we have seen, different for different observers—it is a subjective and not an objective conception, and the gravitation resulting from such a curvature could not conform to the relativity condition. Einstein was accordingly led to suppose that gravitation arose from curvature in the four-dimensional space, or continuum, in which time formed the fourth dimension. This continuum, as has been seen, is objective and if the path of the particle can also be made objective, the resulting gravitation will conform to the relativity principle. The path of the particle in the continuum is, however, simply its "world line," which we have already had under discussion. This world line is determined by natural laws, and if these are to be objective the specification of the world line must also be objective. There is, however, only one specification of world lines in the continuum which is objective in the sense that the same specification will give the same world lines to observers moving with different velocities. It is that every world line must be so drawn as to represent the shortest path between any two points on it. Mathematically, lines which satisfy this condition are known as *geodesics*. Thus Einstein was led to suppose that world lines must be geodesics in the four-dimensional continuum.

Consider for a moment a page of this volume as presenting a two dimensional analogy of the continuum. The shortest distance between any two points is of course the straight line joining them, so that the geodesics are simply straight lines. These possess no curvature of path and if they formed a true analogy to the geodesics in the continuum there could clearly be no explanation of gravitation of the type we have been contemplating. There is, however, another type of two-dimensional surface. It is represented by the surface of a solid body such as a sphere—say the earth. On the earth's surface the geodesics are the great circles; every mariner or aeronaut who desires to sail the shortest course between two points sails along a great circle. To take a definite instance, the shortest course from Panama to Ceylon is not along the parallel of lat. (about 9° N.) which joins them—the aeronaut wishing to fly the shortest course between the two countries will fly N.E. from Panama, he will pass over England and finally reach Ceylon from the north-west. The reader may rapidly verify this by stretching a thread tightly over the surface of an ordinary geographical globe. Let him now trace out the course on an ordinary Mercator chart, and it will be found to appear very curved indeed—the course of the aeronaut will look surprisingly like that of a comet describing an orbit under the attraction of a sun situated somewhere near the middle of the Sahara.

The reader who performs these simple experiments will understand how Einstein was led to suppose that gravitation could be explained by a curvature inherent in the continuum. The world lines of particles are geodesics but the space itself, so to speak, provides the curvature. The curvature of path is thrust upon the particle by the nature of the continuum, but we, who until recently have been unaware even of the existence of the continuum, have been tempted to ascribe it to the action of a special agency which we have invented *ad hoc* and called "gravitation." According to Einstein, it is no more accurate to say that the earth attracts the moon than to say that the pockets of an uneven billiard table repel the balls.

This train of thought may seem artificial. If so, the reason is that we have not been able to explore the other possibilities which have branched off our main line of thought. In point of fact, Einstein found himself practically limited to the conclusion we have stated. Not only so, but the actual type and degree of curvature in the continuum prove to be uniquely fixed in terms of the masses of the gravitating bodies. Thus Einstein, knowing the mass of the sun, found himself in a position to predict absolutely what the motion of the perihelion of Mercury ought

to be. It was found to be  $42.9''$  a century, a figure which agreed with observation to well within the limits of error of these observations. The motions of the other planets, as predicted by the theory of relativity, have also been found to agree with those observed to within the errors of observation. This latter test, however, is not a very stringent one, since the departures from the motion predicted by the Newtonian law are too small to admit of very precise measurement.

Einstein's theory requires us to suppose that the world line of a ray of light also shall be a geodesic in the continuum. In a gravitational field the curvature of the continuum will impose a twist on the path of a ray of light. Einstein found in particular that a ray of light which comes from a distant star and passes near the edge of the sun on its journey ought to be bent, in its passage past the sun, by an angle which should be  $1.75''$  if the ray just grazes the sun, and would be less in proportion to the inverse distance from the centre of the sun for other rays. The observatories of Greenwich and Cambridge dispatched expeditions to test this prediction at the eclipse of 1919. It was found that the stars which appeared near to the sun at the instant of eclipse showed an appreciable displacement, as compared with their normal positions, of the type required by Einstein's theory. Exact measurement confirmed that the displacement varied approximately as the inverse distance from the sun, and that the displacement at the limb was sensibly equal to Einstein's predicted value of  $1.75''$ . The Cambridge observers, hampered by cloudy weather, obtained for this quantity the value  $1.61'' \pm 0.30''$ . The Greenwich observers obtained a value of  $1.98'' \pm 0.12''$ , but it has since been pointed out by Prof. H. N. Russell that their photographs indicate a horizontal and vertical scale difference of the order of 1 part in 12,000, almost certainly due to a distortion of the coelostat mirror under the sun's rays, and if the measures are corrected for this the result is brought much closer to the theoretical prediction.

The theory makes one further prediction which admits of experimental test. The atoms of any element, say calcium, may be supposed to be formed according to a definite specification, the terms of which depend neither on the velocity of a particular observer nor on his position relative to the gravitational fields of the universe. It can be deduced that the light received from a calcium atom situated in the intense gravitational field near the sun's surface ought to be of slower period, and therefore of redder colour, than the similar light emitted by terrestrial atoms. To be more precise; the Fraunhofer lines in the solar spectrum ought to show a displacement to the red; this displacement ought to be homologous, and should be of amount  $0.008 \text{ \AA}$  units at the cyanogen band  $\lambda \text{ 3883}$  at which observations have been chiefly made. Attempts to test this prediction led to strangely discordant results. All observers agreed in finding some effect of the kind predicted, but its amount was always less than the predicted amount, varying from almost *nil* (St. John, 1917) to nearly the full amount to be expected (Evershed, 1918; Grebe and Bachem, 1919). In 1921 the position with regard to this test still remained one of great uncertainty and confusion.

It will have been seen that the restricted physical theory of relativity introduced a revolution into the foundations of scientific thought by destroying the objectivity of time and space. The gravitational theory has effected a hardly less important revolution by destroying our belief in the reality of gravitation as a "force." The physicist has, however, to deal with other "forces" besides those of gravitation, and the question inevitably arises as to whether these too must be regarded as illusions, arising only from our faulty interpretation of the special metrical properties of the continuum. Prof. H. Weyl has pointed out that the continuum imagined by Einstein, and found to be adequate to explain gravitational phenomena, is not, in respect of its metrical properties, the most general type of continuum imaginable. A further generalization is possible and the new curvatures introduced must of necessity introduce new apparent forces other than gravitational. Weyl's investigation shows that these new forces would have exactly the properties of the electric and magnetic forces with which we

are familiar. Indeed, the predicted forces coincide so completely with known electromagnetic forces that no experimental test of Weyl's theory is possible. Had there been the slightest divergence between the forces predicted by Weyl and those predicted by ordinary electromagnetic theory, experiment could have been asked to decide between the two, but no such divergence exists. It may, however, be said that Weyl's theory makes it highly probable that all forces reduce to nothing more than our subjective interpretations of special properties of the continuum in which we live our lives.

Finally a thought may be given to the position, under the new conceptions introduced by the theory of relativity, of the electromagnetic aether. At one stage in the history of science there was a tendency to fill space with aethers, to the extent almost of one aether for every set of phenomena requiring explanation. That stage passed, and by the end of the 19th century only one aether received serious consideration, the so-called electromagnetic aether of Faraday and Maxwell. This aether gave a plausible mechanical explanation of electrostatic phenomena, although it was more than doubtful whether it could account for the electromagnetic phenomena from which it took its name, and it was comparatively certain that it could not account for gravitation. It gave, however, a satisfactory explanation of the propagation of waves of light—they were simply waves in the aether and travelled with an absolute velocity  $c$  determined once and for all by the structure of the aether. On this view it was quite certain that an observer moving through the aether with a velocity  $u$  would measure the velocity of light travelling in the same direction as himself as  $c-u$ . Relativity teaches that this velocity is always precisely  $c$ , and this in itself disposes of the aether of Faraday and Maxwell. Whether any new aether will be devised to replace it remains to be seen, but none appears to be necessary. Any aether which can be imagined would appear to depend upon an objective separation of time and space. Relativity does not deny that such an objective separation may, in the last resort, really exist, but it shows that no material phenomena are concerned with such a separation. By a very slight turn of thought, the primary postulate of relativity may be expressed in the form that the material world goes on as though no aether existed.

To the relativist the essential background to the picture of the universe is not the varying agitation of a sea of aether in a three-dimensional space but a tangle of world lines in a four-dimensional space. Moreover, it is only the intersection of the world lines that are important. An intersection at a point in the continuum represents an event, while the part of a world line which is free from intersections represents the mere uneventful existence of a particle or a pulse of light. And so, since our whole knowledge of the universe is made up of events, it comes about that the tangle of world lines may be distorted and bent to any degree we please; so long as the order of the intersections is not altered, it will still represent the same universe. And so the last function of the aether, that of providing a scale of absolute measurements in space, becomes a superfluity. To the physicist who urges that space measurements without an underlying aether become meaningless, the relativist can reply that time-measurements without an underlying "time-aether" are equally meaningless. A "time-aether" has never been regarded as a necessity, and the relativist feels that the "space-aether" has no greater claim to retention.

(J. H. JE.)

**RENEVIER, EUGÈNE** (1831–1906), Swiss geologist (*see* 23.98), died at Lausanne May 4 1906.

**RENNENKAMPF, PAUL** (1854–1918), Russian general, was born in 1854 and entered the army in 1873. On passing out of the Academy of the General Staff in 1882, he was appointed to the General Staff. From 1895 to 1899 he commanded a regiment and in 1900 he was promoted to the rank of general. In the war with China in 1900 he distinguished himself by his resolute action when commanding a column in Manchuria. In the war with Japan 1904–5 he commanded first a Cossack division, and later large forces of all arms, and again won distinction by his energy. From 1905 to 1913 he was a corps

commander and in 1913 he was appointed to command the troops of the Vilna Military District. At the beginning of military operations in Aug. 1914 he commanded the I. Army which invaded Eastern Prussia. His inaction during the battle of Tannenberg, where the neighbouring army of Samsonov was destroyed Aug. 26-29, was a bitter disappointment, and, by the masses of the people, he was even accused of treachery. Personally brave, daring in small actions, Rennenkampf, as an army commander, showed himself in the strategic sphere alternately rash and timid, owing to his inability to grasp the situation as a whole. At the beginning of 1915 he was recalled from his duties of army commander, and later, under the pressure of public indignation, he was dismissed from the service. In 1918 he was killed by the Bolsheviks.

**RENNER, KARL** (1870- ), Austrian politician, was born on Dec. 14 1870, the son of a peasant, at Unter-Tannowitz, Moravia. He studied law at the university of Vienna, occupying himself especially with questions of administration, and early attached himself to the Social Democratic party. He became an official in the library of the *Reichsrat*, and under the pseudonyms of "Synopticus" and "Rudolf Springer" showed a fertile literary activity, especially in connexion with the problems of the Austrian State, whose existence he justified on geographical, economic and political grounds. On the nationality question he upheld the so-called "personal autonomy," on the basis of which the super-national state should develop, and thereby influenced the programme and tactics of the Social Democratic party in dealing with it. As a theorist he was reckoned as one of the leaders of Neo-Marxism. He had been a deputy since 1907 and after the revolution of Oct. 1918 he became state chancellor of the republic of Austria, headed the Austrian peace delegation at St. Germain, and took over, after Otto Baucr's retirement, the Ministry of Foreign Affairs, which he conducted from the time of the retirement of the Coalition Cabinet in the summer of 1920 until the new elections in Oct. 1920. His principal works are:—*Grundlagen und Entwicklungsziele der oesterreichischen-ungarischen Monarchie* (1906); *Der Kampf der oesterreichischen Nationen um den Staat; Marxismus, Krieg und Internationale*.

**RENOIR, AUGUSTE** (1841-1919), French painter (see 23.101), died on the Riviera Dec. 3 1919.

**REPARATION COMMISSION:** see PEACE CONFERENCE; also 31.123 and 246.

**REPIN, ILJA JEFIMOVICH** (1844-1918), Russian painter (see 23.105), died at Knokkala, on the Finnish frontier, July 17 1918.

**REPPLIER, AGNES** (1858- ), American writer, was born in Philadelphia April 1 1858. She was of French extraction and was educated at the Sacred Heart Convent at Torresdale, near Philadelphia. She was one of America's chief representatives of the discursive essay, displaying wide reading and apt quotation. Her writings contain much sound literary criticism as well as caustic comments on contemporary life. These characteristics were already apparent in the first essay which she contributed to the *Atlantic Monthly* (April 1886), entitled "Children, Past and Present." In 1902 the university of Pennsylvania conferred upon her the degree of Litt.D. She was the author of *Books and Men* (1888); *Essays in Miniature* (1892); *Essays in Idleness* (1893); *Philadelphia—the Place and the People* (1898); *Compromises* (1904); *In our Convent Days* (1905); *Americans and Others* (1912); *Counter-Currents* (1915).

**RESZKE, EDOUARD DE** (1855-1917), operatic singer (see 23.201), died at Garnek, Poland, May 29 1917.

**RÉVILLE, ALBERT** (1826-1906), French Protestant theologian (see 23.224), died in Paris Oct. 25 1906. His son, JEAN RÉVILLE (b. 1854), died in 1908.

**REYER, ERNEST** (1823-1909), French musical composer (see 23.225), died at Lavandou-sur-Huyères Jan. 15 1909.

**REYNOLDS, OSBORNE** (1842-1912), British engineer, was born at Belfast in 1842. He was educated at Dedham grammar school and at Cambridge, and in 1868 became professor of engineering at Owens College, Manchester, holding that post

for nearly 40 years. He was elected F.R.S. in 1877. He was the author of over 70 papers on mechanics and physics published in the transactions of learned societies, notably *Sub-Mechanics of the Universe*, issued by the Royal Society, whose gold medal he won in 1888. (For his work see 3.581; 5.64; 8.783; 14.61; 22.806; 25.444; 28.428.) He died at Watchet, Som., Feb. 21 1912.

**REYNOLDS, STEPHEN** (1881-1919), English author, was born at Devizes May 16 1881. Educated at Manchester University and the École des Mines at Paris, he became sub-editor of an Anglo-French review in 1902 and the following year began an association with the Woolley brothers, fishermen of Sidmouth, which lasted for some years. He thus familiarized himself with fishing and the fisherman's point of view so far as to become a recognised authority on the subject and a medium of communication between fishermen and the Government. He was a member of the committee of inquiry into Devon and Cornwall Fisheries (1912), and of the departmental committee on Inshore Fisheries (1913), and in that year he was appointed adviser on Inshore Fisheries to the Development Commission. In 1914 he became also resident inspector of fisheries for the S.W. area. His publications included *A Poor Man's House* (1908); *Alongshore* (1910); *The Lower Deck, the Navy and the Nation* (1912); as well as a novel, *The Holy Mountain*, (1909) and a volume of tales. He died at Sidmouth Feb. 14 1919.

**RHODE ISLAND** (see 23.248).—The pop. of the state in 1920 was 604,397; in 1910, 542,610; an increase for the decade of 61,787, or 11.4 per cent. Rhode Island was still in 1920 the most densely populated state, having 566.4 inhabitants to the sq. m. (1910, 508.5). Every Federal census since 1790 has shown an increase in density, and at a rate faster than that of the United States as a whole.

The percentages of urban and rural pop. were in 1920: urban, 97.5%; rural, 2.5%; in 1910: urban, 96.7%; rural, 3.3%. The following are the cities of Rhode Island having a pop. of over 20,000 in 1920 and their percentage of increase in the decade 1910-20:—

	1920	1910	Increase per cent
Providence . . .	237,595	224,326	5.9
Pawtucket . . .	64,248	51,622	24.5
Woonsocket . . .	43,496	38,125	14.1
Newport . . .	30,255	27,149	11.4
Cranston . . .	29,407	21,107	39.3
Central Falls . .	24,174	22,754	6.2
East Providence .	21,793	15,808	37.9

The proportion of native-born in 1915 (state enumeration) was 68.8%; of foreign-born, 31.2%. The foreign-born whites numbered in 1920, 173,366, a decrease of 2.6% from 178,025 in 1910. During the 10 years there has been a steady change in the proportions of the various foreign elements in the population. Up to 1910 the largest foreign-born element was Irish. In 1920 the Irish were numerically inferior to the British and English-Canadian, the Italian, and the French-Canadian. There has been a remarkable increase in the number of Italian, Portuguese and Polish immigrants, and a noticeable influx of Armenians and Syrians. "Foreign stock," i.e. foreign-born and native-born of foreign parents, constituted, in 1915, 63.3% of the whole population.

**Agriculture.**—There has been a decline in farm acreage of 29.3% in 30 years to 331,600 ac. in 1920, and an even greater decline, 51.2%, in improved acreage to 132,855 ac. in 1920. The number of farms has fallen from 5,292 in 1910 to 4,083 in 1920. On the other hand there has been a rise in both the aggregate and the average value of farms, and in the value of crops (value of land and improvements, 1900, \$26,989,189; 1920, \$33,636,766; value of crops, 1909, \$2,986,816; 1919, \$5,340,378).

**Fisheries.**—Fishing has, on the whole, declined in relative importance. The shell-fish industry suffered severe loss, owing to the pollution of the Providence river and the upper waters of Narragansett Bay. From 1907 to 1920 the leased oyster grounds declined from 21,000 to 7,000 ac.; the state rentals, from \$136,000 to \$40,000; and the output during the oyster season from 10,000 gal. daily to 2,000 gallons. In 1920 the Commissioners of Shell Fisheries reported: "The Providence river has been practically destroyed as a suitable place for the production or growth of shell-fish as food," the result of contamination.

**Manufactures.**—Rhode Island is preëminently a manufacturing state. In 1914 it ranked 19th among the states in the value of its manufactures. The number of persons engaged in manufacturing and mechanical pursuits nearly doubled in 20 years (1900, 101,162; 1910, 156,898; 1920, 196,205). The number of factories increased from 1,678 in 1900 to 2,829 in 1919; the capital invested in manu-

facturing from \$183,784,587 in 1900 to \$304,595,000 in 1914; and the value of all manufactured products from \$184,074,378 in 1900 to \$346,962,500 in 1916. Wages paid to factory employees in 1914 totalled \$58,784,000; value added to products by manufacture, \$116,930,000. Children under 16 years employed in factories numbered, in 1920, 7,243, of whom nearly 5,000 were in textile mills. The effect of the World War upon child labour in Rhode Island may be seen from the following statistics: in 1915 children under 16 years constituted 3.16% of all the factory operatives; in 1918, 4.44%; in 1919, 3.96%; in 1920, 3.69%. Textiles still held in 1920 the first place among the manufactures of the state, employing 83,204 persons. From 1910 to 1920, woollen and worsted mills increased in number from 88 to 103 (with 463,342 spindles and 9,304 looms); in employees, from 24,924 to 29,500; in value of products, from \$74,600,000 to \$90,000,000. Cotton mills increased in number from 106 to 130 (with 2,595,395 spindles); in employees, from 28,786 to 37,382; and in value of products, from \$50,313,000 to \$67,500,000. Over 7,000 were persons employed in bleaching and finishing, 6,000 in the manufacture of hosiery and knit goods, and nearly 3,000 in the manufacture of hosiery and knit goods. The combined value of the products of these factories exceeded \$20,000,000. Webbing and braid were also produced in large quantities; and in recent years tire fabrics have become an increasingly important article of manufacture. Third among the industries of Rhode Island in 1920 were the machinery and metal trades, with 25,197 employees, and products valued at \$45,000,000. In the manufacture of jewelry and silverware Rhode Island ranked first among the states. In 1914 the value of the jewelry produced was more than one-fourth of the total for the United States. The number of persons employed in making jewelry, silversmithing, reducing and refining gold and silver in 1920 was 1,052, in 322 establishments; and the value of the product was estimated at \$37,500,000.

**Transportation.**—The railway mileage within the state in 1920 was 209.49 m., electric and street railways, 351.5 miles. The construction of a branch of the Grand Trunk Railway system from Palmer, Mass., to Providence was projected in 1910; but work was suspended in Nov. 1912, and has not been resumed. Considerable sums have been spent by the Federal Government for the deepening of the channel of Narragansett Bay, for harbour improvement at Providence, Newport, Westerly and Pawtucket, and for the construction of harbours of refuge at Block I. and Pt. Judith. The foreign imports of the customs district of Rhode Island amounted in 1920 to \$8,252,046. Foreign and domestic commerce passing through Narragansett Bay in 1914 amounted to \$320,195,277.

**Finance.**—The position of the state, Dec. 31 1920, was: assessed valuation, \$98,061,741; rateable wealth, \$1,745,715,365 (about \$2,890 per capita); receipts, \$6,909,172; expenditures, \$6,187,173; bonded debt, \$10,832,000; sinking fund, \$1,631,917. June 30 1920 there were in Rhode Island three state banks, 17 national banks, 13 trust companies, 15 savings banks, and 10 other institutions for savings and loans; with total resources of \$416,339,951. From June 30 1918 to June 30 1920 the assets of the state banks increased 47%; of the trust companies, 21%; of the savings banks, 20%; and of the national banks, 11%. Deposits in the savings banks, June 30 1920, were \$113,200,366, an average of \$630 per account. The average savings deposit in 1918 (\$82.95) was the largest in any state.

**Charitable and Penal Institutions.**—In 1917 the Board of Control and Supply and the Board of Charities and Corrections were superseded by a State Penal and Charitable Commission. The number of the inmates in the institutions under the supervision of the Commission was, in 1919, 3,241 (468 less than in 1918); and the amount expended was \$1,189,956. The budget for 1921 called for \$1,562,394, to which should be added about \$21,000 in aid of various private charitable organizations.

**Education.**—The total school population (age 5 to 15) in 1920 was 123,705, of whom 106,142, or 85.5%, were in school. There were 83,525 in public schools; 20,690 in parochial schools; and 1,927 in private schools. The total expenditure for education in 1920 was \$4,493,772, of which \$999,850 was contributed by the state, the remainder by the towns. In addition to its expenditure for primary and secondary instruction and for normal training, the state annually votes modest subsidies for the R.I. State College; the R.I. School of Design; the R.I. College of Pharmacy; the R.I. Historical Society; the Newport Historical Society; and about 70 public libraries, with over 700,000 volumes. In April 1920 the name of the State Normal school was changed to the R.I. College of Education. The enrolment of the institution in 1920-1 was 774 students and 57 instructors; state appropriation, \$86,000. The state also maintains observation and training courses in various schools, and likewise makes an annual grant of \$5,000 to Brown University in support of graduate courses in education. The R.I. State College at Kingston had, in 1920-1, 345 students and 55 instructors, an income of \$168,000, and buildings valued at \$500,000. The R.I. School of Design, Providence, has doubled in size since 1910; the number of students has increased from 923 to 1,856; instructors from 50 to 108; funds from \$186,310 to \$2,849,322; buildings from \$220,000 to \$650,000. Its museum is considered the most valuable in New England, outside of Boston. Providence College (Roman Catholic) was chartered in 1917, and opened for instruction in 1919, under the direction of the Dominican Order. In 1920, \$200,000 was raised for buildings. The

enrolment in 1920-1 (two classes) was 163 students; faculty, fourteen. Brown University, the oldest (founded 1764) and largest academic institution in the state, from 1911 to 1921 increased its faculty from 85 to 107; its students from 944 to 1,367 (plus 881 in extension courses); funds from \$3,758,926 to \$6,600,000, with about \$1,750,000 of endowment subscriptions still to be paid in; volumes in the library from 180,000 to 270,000. The Arnold Biological Laboratory and Metcalf Hall have been added to the buildings; and a new Chemical Laboratory and a Hall of Modern Languages were in 1921 about to be erected. Providence is unusually rich in libraries. Among the most important collections are those of the Providence Public Library, 230,000 vol.; the Providence Athenaeum, 95,000; the R.I. Historical Society, 50,000; the Annmary Brown Memorial (founded by Gen. Rush C. Hawkins), containing a rare collection of incunabula; and the Shepley collection on R.I. history, 25,000 volumes.

**History.**—The political history of the state from 1910 to 1920 was comparatively uneventful. In 1911 an amendment to the constitution provided for biennial election of the state officers and Legislature. In 1909 the number of representatives in the Lower House was fixed at 100; but repeated attempts to reform the Senate and institute representation according to population have uniformly been defeated. The city of Providence, with 40% of the population of the state, has but one member in a Senate of thirty-nine. The property qualification for the full municipal franchise is still in force. In 1912 the number of Congressional districts was increased from two to three. But under a new apportionment on the basis of the census of 1920 the state would stand to lose a seat, unless the National House of Representatives is enlarged. The presidential vote of the state was cast in 1912 for Wilson, Democrat; in 1916 for Hughes, Republican (though at the same time a Democratic U.S. Senator was elected); in 1920 for Harding, Republican. Rhode Island ratified the Nineteenth (Woman Suffrage) Amendment to the Federal Constitution; but, with Connecticut and New Jersey, failed to ratify the Eighteenth (Prohibition) Amendment. In 1920 the state brought suit in the U.S. Supreme Court to test the validity of the Amendment and of the Volstead Act. The suit was dismissed. For the service in the World War Rhode Island furnished 28,817 men. The National Guard in 1918 numbered 4,625 officers and men. Subscriptions to Liberty and Victory loans amounted to \$209,444,110.

The governors since 1910, all Republicans, were: Aram J. Pothier, 1909-14; R. Livingston Beekman, 1915-20; Emery J. San Souci, 1921-.

**BIBLIOGRAPHY.**—H. M. Chapin, *Bibliography of Rhode Island* (1914); *Cartography of Rhode Island* (1915); *Documentary History of Rhode Island* (2 vols., 1916, 1919); *Rhode Island in the Colonial Wars* (1918); T. W. Bicknell, editor, *History of the State of Rhode Island and Providence Plantations* (1920); *The Story of Dr. John Clarke* (1915); A. B. Strickland, Roger Williams, *Prophet and Pioneer of Soul-Liberty* (1919); R.I. Historical Society, *R.I. Historical Collections*, issued quarterly; Massachusetts Historical Society, *Commerce of Rhode Island 1726-1800*; Charles Carroll, *Public Education in Rhode Island* (1919). (T. C.)

**RHODES, JAMES FORD** (1848- ), American historian (see 23.257), was awarded in 1910 the gold medal of the National Institute of Arts and Letters. He published in 1913 *Lectures on the American Civil War* (delivered at Oxford in 1912); in 1917 *History of the Civil War*; and in 1919 *History of the United States from Hayes to McKinley*, being the eighth volume of his *History of the United States*, of which the first appeared in 1893 and the seventh in 1906.

**RHODESIA** (see 23.259).—The three divisions of which this territory had consisted were reduced in 1911 to two by the amalgamation of North-Eastern and North-Western Rhodesia, thenceforward known as Northern Rhodesia simply. The Zambezi is the line of division between Southern and Northern Rhodesia, and whereas geographically and in its political developments Southern Rhodesia is part of South Africa, Northern Rhodesia belongs geographically to Central Africa, it is not "a white man's country" and its political future is not necessarily the same as that of Southern Rhodesia. The administration of the two regions was kept distinct, and in the present article this distinction is preserved wherever necessary. In 1921 Rhodesia was still governed by the British South Africa (Chartered) Co., but measures were in progress to terminate its rule.

**Inhabitants.**—At the census of May 3 1921 the white inhabitants of Southern Rhodesia numbered 33,621,<sup>1</sup> compared with 23,606 in 1911 and 12,596 in 1904. In 1921 males numbered 18,987 and females 14,634. The increase per cent. in the male pop. in the 10 years was 21.87, that of the female pop. 82.23. The natives in 1921 numbered 845,593, compared with 744,559 in 1911 and 591,493 in 1904. Asiatics in 1921 numbered 1,250 and the coloured pop. 1,997. Salisbury and Bulawayo, the chief towns, had in 1921 a white pop. of 5,654 and 6,830 respectively. Gwelo (white pop. 1,148) and Umtali (white pop. 1,874) were made municipalities in 1914, and Gatooma was made a municipality in 1917. All these places have most of the amenities of European towns.

In Northern Rhodesia the white in 1911 numbered about 1,500, and in May 1921 3,585, of whom 2,223 were males and 1,362 females. A considerable proportion of the white residents are officials and missionaries and their families. The native pop. in 1920 was estimated at 928,000.

**Communication.**—Little was done during 1910-21 to extend communication in Rhodesia itself, but from Sakania on the Rhodesian-Belgian Congo frontier the railway was continued through Katanga with the result that the valuable mineral output of that region was carried over the Rhodesian lines. The completion of the line from Zeerust (Transvaal) to Mafeking (Cape province) shortened the distance between Rhodesian stations and Johannesburg by 250 miles and enabled Durban to compete for the Rhodesian trade. On the completion in 1913 of the line through the northern Transvaal to the Limpopo at Messina, proposals were made to bridge the gap left—some 130 m.—between the Union railways and the West Nicholson branch of the Rhodesian system. As the bridging of the gap would place Lourenço Marques as closely in touch with Bulawayo as is Beira (its existing port), there was much opposition from interested parties to the building of the line and construction had not begun in 1921. Among other projects the most important was the so-called Sinoia-Kafue cut-off, to give Salisbury and Beira a much shorter line to Northern Rhodesia and Katanga. The line in 1921 had been built as far as Sinoia only. In south-eastern Rhodesia the branch line from Gwelo had been extended to Victoria.

There was a good deal of road-making, the largest piece of work being the cutting of a road—100 m. long—through the bush from Broken Hill to Lake Tanganyika. This was done for military reasons during the campaign in German East Africa. In 1919 aerodromes were made at Bulawayo and other stations on the Cairo-Cape route.

For the year ended Sept. 30 1919 the report of the Rhodesian Railways Ltd. showed that the gross revenue was £1,058,000; expenditure £568,000 and net earnings £490,000. For the year ended Sept. 30 1910 the corresponding figures were £789,990, £362,000 and £427,000 respectively. The gross revenue of the Beira-Salisbury and Kalomo-Broken Hill sections of the Mashonaland Railway Co. for 1918-9 was £647,000; expenditure £367,000 and net earnings £280,000, compared with £502,000, £184,000 and £317,000 respectively in the year ended Sept. 30 1910.

**Agriculture.**—At the end of 1919 the area under crops, excluding vegetable gardens and land cultivated by the natives for their own benefit, in Southern Rhodesia was 215,276 ac., of which 177,470 ac. were under maize. In 1911 the area under crops was 132,105 acres. The production of wheat increased in Mashonaland, the quantity produced in 1919 (13,432 bags) being double the amount of the output five years previously. Tobacco became one of the principal crops, the production of leaf in 1919-20 being about 2,500,000 pounds. Cotton-growing had not got beyond the experimental stage in 1921. The citrus industry made headway and considerable quantities of oranges, etc., are now exported. Over 6,000 boxes were shipped to the United Kingdom in 1920.

The Mazoe dam, which has an effective storage capacity in a normal season, after allowing for evaporation, of 4,000,000,000 gal., was completed in March 1920. This dam enables sufficient water to be stored for the irrigation of 6,000 ac. with 2½ ft. per annum.

Cattle-breeding in the decade 1911-21 became one of the leading industries of Rhodesia. By the importation of pedigree bulls the native breed was steadily improved. In 1919 29,510 head of cattle was exported by rail or on the hoof to the cold-storage works in the Union or to Portuguese East Africa and the Belgian Congo. By the end of 1919 the number of cattle owned by Europeans (673,431) exceeded the number belonging to the natives. In 1910 the total (European and native owned) was 371,000. The Liebig Co. acquired extensive ranching areas.

In Northern Rhodesia maize and tobacco are the principal crops; wheat was grown under irrigation. Experimental work in the cultivation of wheat and other cereals, fodder plants, fruit and forest trees, fibres and in the investigation of plant diseases was carried on at the Chilanga estate of the B. S. A. Company. Orange-growing was started and a small quantity of cotton grown in the Fort Jameson district adjoining Nyasaland. Large areas of wild rubber exist. Cattle ranching became popular, a good market being found in Katanga for slaughter beasts. Except for the settlement at Fort Jameson, the white residents are mostly concentrated along the railway line from the Victoria Falls to Katanga.

**Mining.**—Gold is now found in a large variety of formations,

including quartz, schists, granite, sandstones, banded ironstones, conglomerates and dolomite.<sup>2</sup> The value of the output steadily increased from £2,566,000 in 1910 to £3,895,000 in 1916, when the yield in ounces was 930,356. The effects of the World War, increased working costs and labour difficulties then brought about a decline and the value of the output had fallen in 1919 to £2,499,000. In 1920 the value of the output went up to £3,056,000, though the yield measured by weight (552,497 oz.) was 40,725 oz. less than in 1919, the rise in value being due to the premiums obtained on sales of gold in 1920. The silver output reached its highest level (£211,989 oz.) in 1917 and this was also the case with coal (£84,954 tons) and copper (£3,911 tons). The largest output of chrome iron ore (88,871 tons) was in 1916. After the end of the World War production was considerably reduced. Asbestos is becoming an important industry, the chief mines being in the Bulawayo and Victoria districts. The output rose from 55 tons in 1908 to 18,823 tons in 1920. Valuable mica deposits are being worked in the Sinoia district, the output in 1920 being 97 tons. Small shipments realized up to £600 per ton. Arsenic (1920, 437 tons) and tungsten (1920, 17 tons) are worked. The output and value of the principal minerals of Southern Rhodesia in 1920 were as follows:—Gold £52,497 oz. (£3,056,549); silver 158,982 oz. (£58,178); copper 3,109 tons (£333,111); chrome iron 60,269 tons (£245,378); coal 578,492 tons (£252,000); asbestos 18,823 tons (£459,572). The total value of mineral production in Southern Rhodesia up to the end of 1920 was £5,164,325.

**Northern Rhodesia.**—The chief mining centres in Northern Rhodesia are Broken Hill (lead and zinc) and Bwana Mkubwa, near the Congo border (copper). The mineral production in 1920 was as follows, the figures for 1916 being given in parentheses for purposes of comparison:—Gold 569 oz. (719 oz.), value £2,998 (£2,980); silver 5,583 oz. (8,777 oz.), value £706 (£877); copper 145 tons (1,298 tons), value £7,601 (£39,362); lead 16,345 tons (1,392 tons), value £335,000 (£25,121). Up to Dec. 31 1913 13,156 tons of zinc ore, valued at £84,577, had been produced. Mining for this ore then ceased. The total value of the mineral production of the northern territory to Dec. 31 1920 was £1,534,000.

**Commerce.**—Bacon-making, oil-crushing and soap-making, cheese-making and meat-canning, in addition to creameries and tobacco factories and flour-mills, are established. The following table shows the value of the imports and exports of Southern Rhodesia (exclusive of specie and goods reexported) in 1910, 1915 and 1919.

	Imports	Exports
1910 . . . . .	£2,786,000	£2,812,000
1915 . . . . .	2,499,000	4,536,000
1919 . . . . .	4,500,000	4,432,000

In Northern Rhodesia the value of imports increased from £168,000 in 1911 to £424,000 in 1919. Exports in 1911 were valued at £107,000 and in 1919 at £452,000.

**Revenue.**—For the year ended March 31 1911 the revenue of Southern Rhodesia was £773,000 and expenditure £752,000. In 1918-9 the revenue amounted to £961,000 and the expenditure was £858,000. The chief items on the revenue side of the account were: customs duty £298,000; native tax £238,000; posts and telegraphs £100,000; stamps and licences £59,000; income-tax and excess-profits tax £60,000. For the year ending March 31 1920 the revenue was £1,031,000, the expenditure £1,061,000.

The revenue of Northern Rhodesia for the year ended March 31 1912 was £116,000, expenditure being £190,000. In 1919-20 the revenue was £169,000 and expenditure £260,000. Native tax produced (1918-9) £83,000 and customs duty £36,000.

**Education.**—In Southern Rhodesia in 1919 public expenditure on education was £125,000, the sum of £39,000 being received from fees. At the end of that year there were 77 public schools open, with 4,775 pupils. There are schools of domestic science at Bulawayo and Salisbury. There were 670 native schools, with 38,284 pupils, conducted by missionary bodies, receiving grants in aid.

In Northern Rhodesia in March 1920 European children attending Government schools numbered 222. The Administration established boarding-houses at three centres.

**Native Affairs.**—No radical change was made in the system of native administration in Southern Rhodesia during 1910-21. The office of Secretary of Native Affairs was filled by the administrator and in each district a commissioner was appointed to direct and protect the natives. The conduct of the white settlers and of the Chartered Co. towards the natives was the subject of strict scrutiny.

<sup>2</sup> The Geological Survey of Southern Rhodesia showed that the majority of the productive gold-mines do not lie in the "schist belt," as previously supposed, but occur in a peculiar granite mass, known as the Mont d'Or granite. Important chrome iron-ore deposits occur in a mass of serpentine and talc-schist, which is related to the Mont d'Or granite in structure and probably in origin. The two masses together, according to the Director of the Geological Survey, Mr. H. B. Maufe (formerly of the Geological Survey of the United Kingdom), constitute an important plutonic complex, which had remained unrecognized until then. The result of the mapping by the Survey was to give a view of the nature of the mineral field totally different from that generally held.

<sup>1</sup> The figures for 1921 are the unaudited return.

Cases of grave injustice had occurred in the earlier history of the territory and in the period under review further charges were brought against the Company in connexion with the rearrangement of the reserves. Settlers complained that certain lands in native reserves were not being beneficially used by them; the natives made similar complaints. In 1914 a commission under the chairmanship of Mr. (afterwards Sir) R. T. Coryndon, then resident commissioner of Swaziland, was appointed by the Colonial Office to inspect and report upon the reserves. The commission concluded its sittings at the end of 1915. It recommended that 5,610,595 ac. should be assigned as additional reserves or extensions to existing reserves, but that 6,673,055 ac. then included within the reserves were not required for that purpose. The total reserve area recommended was 19,428,691 ac., a net reduction of 1,062,460 acres. The Imperial Government decided to accept these recommendations in their entirety in 1917. There was, however, owing to war conditions, delay in adopting the commission's recommendations and attacks were made on the Company's native administration during the greater part of 1919. A Parliamentary White Paper issued in Feb. 1920 contained correspondence between the Aborigines' Protection Society and the Colonial Office on the subject. The charges against the Company were replied to by Lord Buxton (then high commissioner) at Salisbury in Aug. 1919, and by Col. Amery (Under Secretary for the Colonies) in the House of Commons in March 1920. Col. Amery said:—"I believe this House can with confidence endorse the very high testimony of Lord Buxton to the native administration of Rhodesia and the attitude of the civil population generally towards the natives. It is a model, not only in Africa, but for any part of the world where you have the very difficult problem of the white settler living side by side with the native." An Order in Council was passed giving sanction to the Coryndon commission's recommendations. The changes it recommended were gradually carried out and gave rise to little friction. Lord Milner (then Colonial Secretary) set forth in an official despatch that the settlement reached was regarded as final, not only as to the present, but also the future requirements of the natives. To ensure their security of tenure the reserves were vested in the high commissioner for South Africa and would be inalienable save for certain limited purposes and only in exchange for other land.

In Aug. 1921 Prince Arthur of Connaught (the new high commissioner) visited Rhodesia and received a deputation of Matabele. He told them that the decision as to the reserves must stand and that their desire to have a son of Lobengula recognized as paramount chief could not be granted. "You cannot go back," said the Prince; "you must go forward."

The general condition of the natives of Southern Rhodesia had distinctly improved between 1910 and 1920, and their value as an asset of the country became generally recognized. They were not only producers on their own account, but considerable purchasers of European goods. They paid an annual poll-tax of £1—the only levy made upon them by the administration. In 1911 several ordinances designed to secure better housing, feeding and medical supervision of native labourers outside the reserves came into effect. Steps were also taken to provide agricultural and industrial training, and to cope with cattle disease in the native reserves.

Vaccination and medical examination of natives applying for domestic service was made compulsory and the Bulawayo municipality introduced by-laws providing for a standard of housing accommodation for native servants.

Sleeping sickness along the Congo border of Northern Rhodesia necessitated precautions being taken to prevent its southward extension. Some cases of the disease occurred in the Loangwa valley, but they appeared to be sporadic.

*History.*—The outstanding feature of the history of the territory in the period 1910–21 was the steady growth of political consciousness on the part of the white residents of Southern Rhodesia. The framers of the constitution of the Union of South Africa left open the door for the adhesion to it of Rhodesia. The ultimate joining of Rhodesia to the Union was taken for granted by most South Africans, but the actual formation of the Union in 1910 seemed to have a contrary effect. It appeared to give a distinct stimulus to the already nascent desire of the Southern Rhodesians for independent self-government. A distinct advance in that direction was made in May 1911, when, by Order in Council, the elected members were given a majority of the seats in the Legislative Council, provision being made for safeguarding the interests of the British South Africa Company.

The legal position at that time was that the British South Africa Co. exercised under its charter sovereign rights subject only to such control as was exercised by the Colonial Office through the high commissioner for South Africa and a Resident in Rhodesia. While the Company's administrative expenditure was by this time slightly exceeded by the revenue, there was no means of making good the heavy losses incurred in opening up the country save by the sale of unalienated lands. Of their

ownership of the land and of their rights of disposal the Company entertained no doubt and this fact had much influence upon the attitude of the directors. Sir Starr Jameson, on resigning towards the close of 1912 his leadership of the Unionist party in the South African Parliament, became president of the Chartered Co. and retained that position until his death in Nov. 1917.<sup>1</sup> The administrator in Southern Rhodesia was Sir William H. Milton, a man of great experience and tact in his dealings both with the white residents and the natives. After over 16 years' service in the territory Sir W. H. Milton resigned in Oct. 1914 and was succeeded by Mr. (afterwards Sir) Drummond Chaplin. But while the administrator and his executive could do much to make the machinery of government work smoothly, there was no power, locally, to shape policy. Disputes arose between the Company and the settlers, who desired a still larger share in the administration. The controversy became acute in view of the fact that in Oct. 1914, under the terms upon which the charter was originally granted, the Crown would have the right to revise its terms with regard to administration. Sir Starr Jameson, Mr. Rochfort Maguire and other representatives of the Chartered Co. visited Rhodesia in 1913, when a further increase was announced in the numbers of elected members of the Legislative Council. As to the financial position the directors said that, as "the land and minerals belonged to the Company," no debt in respect to past deficits would be placed on the country when the Company relinquished its administration. Mr. Maguire described the Company's proposals as a means for bridging the period antecedent to self-government, the ideal towards which, he claimed, the Company was working. In accordance with the promise given, a redistribution ordinance was passed, the elected members being increased to 12, while the number nominated by the Company was fixed at six. At the general election in March 1914 11 of the 12 elected members returned were pledged to support the maintenance—for the time being—of the Company's administration, but, the Council declared, its continuance should not affect the right "at any time" thereafter to the institution of self-government.

The Council in April 1914 definitely challenged the right of the Chartered Co. to the ownership of unalienated lands. The question had been raised in 1908, but was then allowed to drop. It was now recognized as essential that the matter should be settled before the political status of Rhodesia was altered. On behalf of the Rhodesians (*i.e.* the white settlers) it was claimed that the Chartered Co.'s power to deal with the land was only a delegated right granted by the Crown, and secondly, that if the Company had acquired ownership rights such rights were vested in it "as an administrative and public asset only"; that as a trading body the Company had no title to the land or its revenues. Consequently it was contended that, on the Company ceasing to exercise administrative rights, all unalienated lands should go as public domain to the Government which succeeded it. In July 1914 the claim of the Legislative Council was referred to the judicial committee of the Privy Council for adjudication.

In the meantime it was decided that the Crown should not exercise its right to vary the terms of the charter, which therefore, in virtue of the original provisions, would legally continue unaltered for ten years from Oct. 29 1914. The directors of the Company intimated, however, that they would offer no objection to the earlier establishment of responsible (*i.e.* self) government should it be deemed necessary and had the concurrence of the British Government. A supplemental charter giving effect to this agreement was issued on March 13 1915.

Meanwhile the outbreak of the World War for a time forced the constitutional question into the background. But the war itself had an important bearing on the political question. The party which desired the indefinite continuance of Chartered Co. rule had nearly disappeared, but an influential party had advocated, as the alternative to self-government, joining the Union of South Africa. This party lost ground as Rhodesians

<sup>1</sup> After Sir Starr Jameson's death Mr. Philip Lyttelton Gell acted as chairman of the board of directors and in Oct. 1920 was appointed president of the Company.

saw what was happening in the Union. The growth of separatist and republican sentiment among the Dutch population, evidenced by the increasing support gained by Gen. Hertzog and particularly the rebellion of 1914, inevitably influenced the political orientation of the almost solid British population of Rhodesia. Disinclination to be swallowed up in the Union and dislike of the introduction of bi-lingualism—a necessary result of Rhodesia becoming a province of the Union—were strongly reinforced by real if perhaps exaggerated fears as to the strength of the Dutch nationalist movement. It was possibly due in part to these developments that a proposal put forward by the Company in 1915 for the amalgamation of Northern and Southern Rhodesia secured (in 1917) a majority in the Legislative Council, though it was not proceeded with.

After an exhaustive inquiry the judicial committee of the Privy Council gave its decision as to the ownership of unalienated lands on July 29 1918. It had had before it not only the claims of the Crown and of the Chartered Co. but those of the natives, whose case was put forward without much evidence that it was being pressed by the natives themselves. The judicial committee reported in favour of the Crown. While, however, it decided that the Company could not claim ownership of unalienated land in Southern Rhodesia, it held that it was entitled to be reimbursed for expenses and outlays of administration in current or past years, and that while it continued to administer Southern Rhodesia it was entitled to apply the proceeds of any sale of land towards the reduction of such expenditure. The Company's exclusive rights to all minerals in the country were confirmed and grants or sales of land made by it were finally legalized.

The next step was to ascertain the amount which would be due to the Company in accordance with the judicial committee's report should the administration of Southern Rhodesia by the Company cease. At the request of the Chartered Co. a royal commission, of which Lord Cave was chairman, was appointed in July 1919 to ascertain the amount which would have been due to it for its administrative expenses if its governing powers had ceased on March 31 1918. The claim filed by the Company was in round figures for £8,000,000 plus interest on the accumulated deficits. The Cave commission took evidence in Rhodesia and its award was issued in Jan. 1920. The commission rejected the Company's claim for interest and fixed the amount due to the Company at £4,435,000, subject to deductions (1) in respect of the value of lands appropriated by the Company for commercial purposes, and (2) the proceeds or value of lands and rights alienated by the Company for considerations other than cash, but plus the value of the public works which might be taken over by its administrative successor, estimated at £830,000.

In the interval the campaign for the grant of self-government had been renewed vigorously in Southern Rhodesia. In view of a coming general election the Legislative Council in May 1919 passed a resolution asking the Colonial office publicly to state what proof of fitness "financially and in other respects" would be considered sufficient to justify the grant of responsible government. Lord Milner (then Colonial Secretary) replied in Aug. that he could not regard the territory in its then stage of development as equal to the financial burden of responsible government, and as there appeared to be no great desire for the inclusion of the territory in the Union he advised that matters should be left as they were until the situation became clearer. This reply caused a good deal of dissatisfaction amongst the advocates of responsible government in Rhodesia. The strength of the movement was shown at the general election in May 1920, when the responsible government party secured 12 of the 13 elective seats in the Legislative Council. The 13th member advocated representative government, a half-measure which Lord Milner had considered impracticable.<sup>1</sup> Owing to the suc-

cesses gained by the Dutch Nationalists at the general election in the Union a few months earlier, opinion in Rhodesia, which, in view of the discouraging attitude of the Colonial Office towards responsible government, had tended to consider more favourably entry into the Union, swung round completely.

The new Legislative Council, at its first meeting in May 1920, passed a resolution praying the Imperial Government to establish responsible government and affirming that—

"The record of the people of Southern Rhodesia establishes that they are capable of fulfilling in the interests of all the inhabitants thereof, irrespective of race, the duties of self-government, and are equally as able to bear the responsibility thereof as other peoples of the Empire to whom the rights of self-government have been granted in the past."

Lord Milner, in a despatch dated Dec. 22 1920, again urged delay. "In principle" he favoured the Rhodesian demand and the Chartered Co. was willing, he said, to be relieved of its responsibilities, but, chiefly on the ground of finance, he proposed that the Company's rule should continue till after the next general election, which in the ordinary course would be held early in 1923. If Rhodesia was then still in the same mind, responsible government could be brought into force not later than Oct. 1924. The elected members of the Legislative Council strongly traversed Lord Milner's arguments and in the end the Colonial Office sought the advice of still another committee.

This committee, of which Lord Buxton, lately governor-general of the Union and high commissioner, was chairman, was appointed on March 7 1921. It acted with promptitude and reported on April 12 following. The electors having so recently expressed their views in favour of the abstract principle of self-government, no advantage would be gained (the committee stated) by another vote on the principle. It recommended therefore that a scheme for responsible government should be drawn up in detail and that by means of a referendum the opinion of the electors on such a definite scheme should be ascertained. If the electors accepted the scheme a proclamation or Order in Council should issue annexing Southern Rhodesia to the dominions of the British Crown and that annexation should be followed by letters patent setting up responsible government. The draft of the constitution, it was suggested, should be drawn up by the Colonial Office in consultation with the elected members of the Legislative Council. Two special provisions were proposed:—

(1) That with regard to the natives the existing authority and control by the high commissioner should be retained; and (2) that control of unalienated land should be exercised through the high commissioner on the advice of a specially created land board. This unalienated land would be charged with the payment of the sums to which the Chartered Co. was entitled under the Cave award.

Many objections might be and were raised to the proposed manner of dealing with the land question, but the elected members of the Legislative Council, under the leadership of Sir Charles Coghlan, accepted the recommendations of the Buxton committee, and Rhodesian delegates were appointed to confer with the Colonial Office.

Meanwhile the general election in the Union in Feb. 1921 had resulted in the defeat of the Dutch Nationalists (though not in any diminution of their voting strength), and it was arranged that, before any irrevocable step was taken, the Rhodesian delegates should consult with Gen. Smuts, the Prime Minister of the Union, as to the alternative plan of Rhodesia becoming a province of the Union. The conference with Gen. Smuts was held at Cape Town in Sept. 1921, before the delegation left for England. It was made clear that if the Rhodesians had changed their minds and desired admission to the Union they would be welcomed, but that the Union would require the ownership of the unalienated lands.

The influenza epidemic of 1918 took a heavy toll of the natives of Rhodesia; the death-roll was estimated at fully 30,000.

A national tribute was paid to Sir Starr Jameson on May 22 1920, when his body, brought from England, where it had been temporarily interred, was given a last resting-place close to the grave of Cecil Rhodes at the World's View in the Matoppo Hills.

<sup>1</sup>The following is an analysis of the returns, one member being elected unopposed. Votes for responsible government 4,663; for representative government 420; for joining the Union of South Africa 814; for continuance of Chartered Co. s rule 868; total poll (out of 11,098 electors) 6,765.

Survivors of the pioneers Jameson had led into Mashonaland in 1890 were present, and Matabele and Mashona indunas.

*Rhodesia's Part in the World War.*—The Rhodesian frontiers in 1914 touched German protectorates both on the west and east. The Caprivi "Finger" of German S.W. Africa came up to the Zambezi, west of the Victoria Falls. It was occupied by the Rhodesian forces with little difficulty. On the east a more serious situation was presented, as the Germans, in comparatively strong force, entered Rhodesian territory between Lakes Tanganyika and Nyasa. Aided by and giving aid to the troops of the Belgian Congo, Rhodesian volunteers and the British South Africa police rendered excellent service and held their own against the Germans. Subsequently Rhodesians played a notable part in Gen. Northey's offensive. A small Matabele contingent took part in the fighting, and a combatant battalion was raised from the natives of Northern Rhodesia.

From the first the Rhodesians were not content with the defence of their own territory. A regiment (1st Rhodesian) was raised for service in the 1914 rebellion and in the campaign in S.W. Africa, and early in 1915 another regiment (2nd Rhodesian) was sent to British East Africa, where it gained a deservedly great reputation. Many Rhodesians also enlisted in the British army. Altogether 6,859 Rhodesians (Europeans) were on active service during the war, a number much more than half the adult male population. Rhodesian natives engaged as combatants in E. Africa numbered 2,721, and in addition there were 40,732 "first-line" carriers. Some 152,000 other carriers were engaged on war service in Northern Rhodesia alone.

In the last days of the war (Nov. 2 1918) Gen. von Lettow Vorbeck, with all that was left of the German forces, turning westwards from his pursuers, entered Northern Rhodesia and had reached the Chambezi near Kasama on the day the Armistice was signed in Europe. It was in Rhodesia, therefore, that the last act in the war was played, von Lettow surrendering to the magistrate at Kasama on Nov. 14.

*Northern Rhodesia.*—The amalgamation of North-Eastern and North-Western Rhodesia was carried into effect on Aug. 17 1911, when Mr. (afterwards Sir) Lawrence Wallace was appointed administrator, a post he held for nearly ten years.<sup>1</sup> The defence of the territory, which had been shared with Nyasaland, had been taken over entirely by the Rhodesian authorities a short time before the amalgamation was carried through. The number of British settlers gradually increased and missionaries did valuable work in training the natives and introducing higher standards among them. The proposal of the Chartered Co. to amalgamate Northern and Southern Rhodesia has already been referred to; the project was dropped. The war, which deeply affected Northern Rhodesia, at first caused marked depression, which was removed by the military expenditure in 1916-7, while the building of the Katanga railway and the mining activity in Katanga brought about a revival. An elective, but purely advisory, council was established in July 1913.

The Chartered Co. was faced with much the same difficulties in Northern as in Southern Rhodesia, nor in the north did revenue meet administrative expenditure. Up to March 31 1919 the deficit was placed at over £1,250,000. As in Southern Rhodesia, the Company claimed the land and minerals and the repayment of administrative deficits, and, equally, the white settlers claimed a greater share in the government, notably control of finance. The consideration of these questions was remitted to the Buxton committee, which in its second report, dated April 29 1921, advised that the legality or otherwise of the Company's claims should be settled by the Privy Council before the future status of Northern Rhodesia was decided. Meanwhile the immediate creation of a legislative council was recommended.

*Barotseland* (see 3,424).—Barotseland, the S.W. part of Northern Rhodesia, continued to be a native reserve in which Europeans, other than the officials of the Chartered Co. and missionaries and traders approved by the paramount chief, were not allowed to settle. The paramount chief in the exercise of his authority is aided by a *ngambella* (prime minister) and a *kolla* (council); he has no jurisdiction over Europeans. Relations between the Barotse and the Company were satisfactory, and missionary enterprise prospered. Distinct interest in education was shown; in 1912 there were 413 scholars at the Barotse national school, 251 being boarders. Lewanika (see 16,519), who had placed his country under British protection and who won and retained the reputation of an enlightened ruler, died in 1916. He was succeeded by his eldest son Yeta III. (formerly known as Litia). Lealui, the native capital, and Mongu, the residence of the

chief British officials, are both on the Zambezi and seven miles distant from one another.

A list of parliamentary papers relating to Rhodesia is given in the *Colonial Office List*, published annually in London, and annual reports are issued by the British South Africa Company. See also C. Gouldsbury and H. Sheane, *The Great Plateau of Northern Rhodesia* (1911); A. Darter, *The Pioneers of Mashonaland* (1914); the *Report of the Rhodesia Resources Committee* (1921); H. Rolin, *Les lois et l'administration de la Rhodésie* (1913); J. H. Harris, *The Chartered Millions* (1920); and A. S. and G. G. Brown, *The South and East African Year Book and Guide* (annually).

**RHONDDA, DAVID ALFRED THOMAS, VISCOUNT** (1856-1918), British colliery owner and Food Controller in the World War, was a Welshman, born March 26 1856 in Aberdare, grandson of a Monmouthshire yeoman farmer, and son of a Merthyr grocer. His father had prospered in his trade, and in later life enriched himself by speculations in coal. Young Thomas was sent to Clifton College, and afterwards to Caius College, Cambridge, where he graduated as a *senior optime* in the mathematical tripos in 1880, and immediately joined his father in the coal business. He threw himself with great energy and ability both into that and into local Liberal politics; and was so successful in both spheres that he was returned to Parliament for Merthyr in 1888. His extraordinary commercial gifts, his insight, his foresight, and the sympathy which he brought to bear on the conditions of life in the mining industry, soon made him a prominent, and eventually the leading, figure in the industrial world of S. Wales. "D.A." as he was always called, by his initials, in his own part of the country, endeared himself to the miners by becoming their champion in the 'nineties against the undercutting of prices by middlemen, and by the generous wages which he paid in the collieries under his control; and though in subsequent years he sometimes had differences with the men, he always retained their respect. His business combinations brought him great wealth and culminated in the Cambrian super-combine, which produced some six million tons of steam coal a year. Other important undertakings in which he took a leading share were the Ebbw Vale Steel, Iron and Coal Co., the Rhymney Iron Co., and the Taff Vale Railway Company. So extensive were the ramifications of his interests that, when he accepted office in 1916, the number of directorships from which he retired was no fewer than forty. He had much longer to wait for success in the political than in the commercial field. Though he sat in the House of Commons for Merthyr for 22 years and afterwards for some months for Cardiff, no use was made by the political chiefs of his party of his great capacities for public service, and he therefore retired from Parliament in 1910.

The outbreak of the World War gave him his opportunity. He rendered substantial help to Mr. Lloyd George both at the Exchequer and in the office of munitions, by organizing British industrial resources for war. He took a lead in "capturing German trade," carrying through, for instance, the acquisition of the Sanatogen business. He went to America to complete important war contracts for the Government, and on his return was saved, with his daughter, Lady Mackworth, from the sinking of the "Lusitania." He went back to America almost immediately, and spent seven months there at his own expense, expediting the output of munitions, and regulating and systematizing the prices charged. He was created a baron, as Lord Rhondda, for his services in Jan. 1916; and it was natural that, when Mr. Lloyd George, in forming his ministry in the following Dec., made up his mind to introduce captains of industry into office, he should turn at once to his old ally, who became president of the Local Government Board. His principal business in this post was to prepare for the establishment of the Ministry of Health. Before this was effected he accepted, in June 1917, at the Prime Minister's pressing request, the onerous burden of the Food Controllorship, vacated by Lord Devonport. He was no respecter of persons, and immediately took strong steps to put an end to the speculation in the necessities of life which was becoming a public scandal. Then he

<sup>1</sup> On the retirement of Sir L. Wallace (1920), Sir D. Chaplin, the administrator of S. Rhodesia, took charge of N. Rhodesia also.

gradually fixed prices and brought supplies under control, in regard to almost all articles of food except vegetables. Thus he eliminated profiteering in food-stuffs. He also carried through a great decentralization in the administration of his office. But he will be mainly remembered as the author of the system of compulsory food rationing, which was carried out with absolute fairness and impartiality, putting an end to the queues waiting at butchers' and bakers' shops that had rendered the house-keeper's life a burden. As Food Controller, Lord Rhondda ran the biggest trading organization that the world had ever seen. The turnover of his Ministry, apart from the work of the wheat and sugar commissions, amounted to 1,200 millions sterling; with them 2,733 millions sterling. Supplies never failed, and in spite of the German submarine menace there was no hunger in the United Kingdom. His strenuous labours affected his health, and in April 1918 he tendered his resignation; but his work was so invaluable that pressure was put upon him to remain, and he was created a viscount. But the strain was too great. He was attacked by pneumonia and died on July 3. Tributes to his work and to the public loss sustained by his death were paid in both Houses of Parliament.

He married Sybil Margaret Haig, a cousin of Lord Haig, who survived him. They had one child, a daughter, who married Sir Humphrey Mackworth, and who succeeded to the viscounty of Rhondda under a special remainder. (G. E. B.)

**RHYS, SIR JOHN** (1840-1915), British archaeologist and Celtic scholar, was born in Cardiganshire, the son of a yeoman farmer, and educated at the Bangor Normal College and Jesus College, Oxford. In 1877 he was elected professor of Celtic at Oxford, the first occupant of the newly created chair, and he held that post till his death. In 1895 he became principal of Jesus College. He was Hibbert lecturer in 1886, Rhind lecturer in archaeology at Edinburgh in 1899 and president of the anthropological section of the British Association in 1900. He also served on several royal commissions and was knighted in 1907. He died at Oxford Dec. 16 1915. His published works include *Lectures on Welsh Philology* (1877); *Celtic Britain* (1882, last ed. 1904); *Celtic Heathendom* (1886); *Studies in the Arthurian Legend* (1891); *Celtic Folk-lore* (1901); as well as editions of Welsh texts (with J. G. Evans); *The Welsh People* (with D. B. Jones, 1900), and numerous other papers and studies of Celtic inscriptions and literature. For his work on the Arthurian legend see 12,309, 321, 669.

**RIAZ PASHA** (c.1835-1911), Egyptian statesman (see 23,281), died June 18 1911.

**RIBOT, ALEXANDRE FÉLIX JOSEPH** (1842- ), French statesman (see 23,285). On Jan. 3 1909 M. Ribot was elected a member of the French Senate, and in Feb. of the following year was offered, but refused, the Ministry for Foreign Affairs in the Monis Cabinet. After the formation of M. Poincaré's Government on Jan. 14 1912 he took the place of M. Léon Bourgeois as president of the committee appointed to deal with the Franco-German treaty, the necessity for the ratification of which he demonstrated. In 1913 he was an unsuccessful candidate for the presidency of the Republic, and on the fall of M. Barthou's Government was invited by President Poincaré to form a Cabinet, but refused. In 1914 he became, with M. Jean Dupuy, leader of the Left Republican group which refused to accept the decisions of the Radical Socialist congress at Pau in Oct. 1913. On June 9 1914 he became prime minister and Minister of Justice, but his Government was bitterly assailed by the Radical Socialists as well as other groups, and only lasted one day.

With the outbreak of the World War M. Ribot's great reputation as an expert in finance and foreign affairs brought him effectively into office. On Aug. 27 1914 he became Minister of Finance in M. Viviani's Ministry of National Defence, an office which he retained when, on Oct. 28 1915, M. Briand succeeded M. Viviani as prime minister. On Feb. 7 1916 he visited London and held a conference with the Chancellor of the Exchequer at the Treasury. When Briand reconstituted his Cabinet, in Dec. 1916, Ribot retained the portfolio of Finance. On the fall of the Briand Ministry (March 17 1917) President Poincaré again

called upon M. Ribot to form a Government, and this time he consented, himself taking the portfolio of Foreign Affairs in addition to the premiership (March 19). In the statement of his policy made to the Chamber on March 21 he declared this to be "to recover the provinces torn from us in the past, to obtain the reparations and guarantees due to France, and to prepare a durable peace based on respect for the rights and liberty of peoples." On July 31, in a reply to the German Chancellor Michaelis, he admitted that in 1917 an agreement had been made with the Tsar to erect the German territories on the left bank of the Rhine into an autonomous state, but denied that there had been any question of their annexation to France. His Government resigned office on Sept. 7; but he accepted the Ministry of Foreign Affairs in the Painlevé Cabinet constituted six days later. He resigned office finally on Oct. 16, owing to the violent criticism of his refusal to fall into the "trap" of the German peace offers.

**RIBOT, THÉODOLE ARMAND** (1839-1916), French psychologist (see 23,286), died in 1916.

**RICHARDS, THEODORE WILLIAM** (1868- ), American chemist, son of the artist William Trost Richards (see 23,299), was born at Germantown, Pa., Jan. 31 1868. He was educated at home, at Haverford College (S.B. 1885), Harvard (A.B. 1886; Ph.D. 1888), Göttingen, Leipzig and the Dresden Technical School. After passing through the various grades of promotion he was appointed professor of chemistry at Harvard in 1901 and was made director of the Wolcott Gibbs Memorial Laboratory in 1912. He was best known for his researches on atomic weights, of which he revised over a score, including that of radioactive lead. The results were generally accepted and for his contributions he received the Nobel Prize in Chemistry in 1914. He also gave much time to physicochemical investigation, especially concerning electrochemistry and chemical thermodynamics, piezochemistry and surface tension. Of these his contributions to atomic compressibility, to the relation between the change of heat capacity and the change of free and total energy, and to the thermodynamics of amalgams have perhaps been the most noteworthy. In 1907 he was Harvard exchange professor at Berlin, and in 1908 Lowell lecturer. He was president of the American Chemical Society (1914), the American Association for the Advancement of Science (1917) and the American Academy of Arts and Sciences (1919). He was a member of the National Academy of Sciences and of most of the European academies. He received hon. degrees from Yale, Harvard, Haverford, Pittsburgh, Clark, Pennsylvania, Oxford, Manchester, Christiania, Prague and Berlin. He was awarded the Davy (1910), Faraday (1911), Willard Gibbs (1912), and Franklin (1916) medals. He was made a member of the National Research Council in 1916.

**RICHBOROUGH**, a port on the left bank of the mouth of the Stour river, Kent, England,  $1\frac{1}{4}$  m. N. of Sandwich, created by the Government during the World War as a base for the expedition of *matériel* to the armies in France and Flanders. The port was planned in June 1916, primarily to relieve Dover of this class of transport. The site chosen consisted of an expanse of marshland through which the Stour flowed as an insignificant stream. The work of construction was under the control of the Inland Waterways and Docks Section of the Royal Engineers, and involved the reclamation of a large tract of swampy foreshore, the widening and deepening of the waterway, the construction of a wharf and jetty nearly a mile in length equipped with powerful cranes and of docks for the building and repair of certain kinds of craft, the erection of acres of hutments and store-sheds, and the laying of some 50 m. of railway sidings. The work was rapidly pushed forward, the workers at one time numbering 20,000; and eventually a self-contained cantonment arose, having its own postal, police, lighting and other services.

The base was operated in a comparatively small way at first but developed into an undertaking of gigantic proportions. At the outset, steamers and barges were used to convey the war material across, until the French ports became congested; then special barges were introduced to take goods direct into the

French canals and thence as close to the firing line as possible. In 1917, speed of transport of material becoming extremely urgent, it was decided to establish a train-ferry service; it came into operation at the end of that year, and the hoisting of cargoes by cranes into barges was largely superseded. Three ferries plied incessantly between Richborough and Calais and Dunkirk, connecting railhead in England with railhead in France. In all, 4,000 barge loads of ammunition, 17,818 guns and limbers, and over 1½ million tons of other stores were sent across.

The ferries, specially designed and built at the works of Sir W. G. Armstrong, Whitworth & Co. of Elswick, were of 363 ft. overall length, 61 ft. beam and 3,654 tons displacement. Four lines of rails on deck gave accommodation for 54 ten-ton wagons carrying an average load of 900 tons. A lifting bridge at the wharf-end, which the ferry approached stern on, enabled accurate connection of rails at all states of the tide, the process of embarking a train requiring ordinarily not more than 15 minutes.

For the protection of the base, a monitor was stationed in Pegwell Bay, and searchlights and heavy and anti-aircraft guns were mounted at many points. Repeated air-raids took place in the vicinity and there were several bombardments from the sea, but Richborough itself was never seriously damaged, the low-lying, featureless character of the marshland probably affording its best protection, more especially at night.

For a year after the Armistice, Richborough continued to deal with vast quantities of material returned from the western front. After the sale and disposal of the surplus military stores and equipment, the port, with the remaining equipment and the fleet of ferries and barges, was sold by the Disposal Board for £1,407,000 (plus the cost up to £40,000 of acquiring the land by the Government) to the Queenborough Development Co., who thus acquired 1,500 ac. of land including 250 ac. that were reclaimed from the swampy foreshore. In 1921, the company proposed to work Richborough as a barge and train-ferry port, ancillary to Queenborough, both centres to serve the requirements of a comprehensive scheme of industrial development in the surrounding districts including the Kent coal-fields.

**RICHMOND, SIR WILLIAM BLAKE** (1842-1921), English painter (see 23,307), died at Hammersmith Feb. 11 1921.

**RICHTER, HANS** (1834-1916), Hungarian musical conductor (see 23,312), died at Bayreuth Dec. 5 1916.

**RIKETTIS, CHARLES** (1866- ), English artist, was born at Geneva Oct. 2 1866, and was educated in France. In 1889 he became joint editor with Charles Shannon of the *Dial*. In 1896 he founded the Vale press, the output of which was a series of beautifully designed and printed books. Of his pictures, "The Plague" (1911) is in the Luxembourg at Paris, and "Don Juan" (1916) in the National Gallery of British Art. He published *The Prado and its Masterpieces* (1903), *Titian* (1906) and *Pages on Art* (1913).

**RICOTTI-MAGNANI, CESARE** (1822-1917), Italian general (see 23,316), died at Novara Aug. 4 1917.

**RIDDELL, GEORGE ALLARDICE RIDDELL, 1ST BARON** (1865- ), British newspaper proprietor, was born in London May 25 1865 and educated privately. He became a solicitor in 1888 and settled in practice at Cardiff. There he acquired an interest in the *Western Mail*, and he eventually turned his energies mainly to newspaper management. He went to London and obtained control over the Sunday paper, the *News of the World*, which he developed on popular lines, so that it obtained a huge circulation during the first decade of the 20th century and made its proprietor a very wealthy man. He gradually extended his newspaper connexions, becoming a director also of George Newnes Ltd., Country Life Ltd., and C. Arthur Pearson Ltd., etc. By the year 1909, when he received a knighthood, he had become one of the most influential personalities in the London press, and he took an active part in giving a more efficient organization to various forms of press work, by way of collective action between proprietors themselves and their organs. He was a prominent member of the Newspaper Proprietors' Association at the outbreak of the World War, and owing to his intimate relations with Mr. Lloyd George he gradually became the principal *liaison* between the Press and the Government so far as all matters of publicity were concerned. In this capacity he

represented the British Press at the Peace Conference in 1919 and at all the important Allied conferences subsequently. He was created a baronet in 1918, and raised to the peerage as Baron Riddell of Walton Heath in 1920.

**RIDGEWAY, SIR WILLIAM** (1853- ), British archaeologist, was born in Ireland Aug. 6 1853 and educated at Portarlington, Trinity College, Dublin, and at Caius College, Cambridge, where he was fifth in the classical tripos. In 1880 he was elected fellow of Caius College, Cambridge, and in 1883 became professor of Greek at Queen's College, Cork. In 1892 he returned to Cambridge as professor of archaeology and in 1907 became also Brereton reader in classics. He was made a fellow of the British Academy, and president of the Royal Anthropological Institute (1908-9). He was knighted in 1919. Amongst his publications are *The Origin of Metallic Currency and Weight Standards* (1892); *The Early Age of Greece* (1901); *The Origin and Influence of the Thoroughbred Horse* (1907); *Who were the Romans?* (1907); *The Oldest Irish Epic* (1907), etc. His views on early Greek civilization are described in 12.442; those on the origin of the Romans in 23.616, and those on the horse in 13.717.

**RIFLES AND LIGHT MACHINE-GUNS** (see 23,325 and 17.237).—Since 1910 there have been few important changes in the design of the military bolt-action rifle. The adoption by many countries of the pointed bullet in lieu of the round-nosed (see 23,328) has led to some strengthening of parts so as to withstand increased chamber pressures. Modifications in the patterns of sights used have also been made here and there.<sup>1</sup> The military rifle had practically reached its zenith before 1914, and the opening of the World War found all armies equipped with rifles of practically equal merit. With the exception that the French continued to use the tube-magazine Lebel rifle and the British and Americans had adopted a shorter barrel than the rest, it might be said that the military rifles of the world were not only equal in merit but similar in design.

This initial equivalence of the opposed rifles continued throughout the war period. Further changes of detail were made. Special rifles were sometimes brought into use for snipers, and fittings were added to the standard service rifle to adapt it as a grenade-thrower and as a sniper's weapon to be used from a deep trench. A heavy single-loader was designed in Germany as an anti-tank weapon, and many changes were made in the ammunition. But the rifle itself, the rifle of the average infantryman, was practically the same at the end of the war as it had been for the past 15 years, or, setting aside the change of bullet type, for twenty-five. The German army of 1918 carried the 1898 rifle, the French the Lebel model 1886-93, the Italians the Mannlicher-Carcano of 1891. The Russian three-line (.3-in.) rifle of 1900 was only a modification of the earlier Moussin and Nagant models. The most modern patterns were the British and the American, and these were characterized by having a relatively short barrel, experience in the S. African War having brought "snap shooting" and the consequent need of handiness into relief. Otherwise the elements and their functions were the same, and the dimensions of the same order, in all rifles except the French.

This standstill of progress, in a time when the design of every other kind of weapon was developing at an unprecedented rate, is very remarkable and indicates clearly enough that the military rifle of the conventional type had reached its zenith. As a type, it was not capable of much further development. Designers had already by 1914 produced the first practical models of automatic and semi-automatic arms. Governments were unwilling to re-arm their troops and re-stock their armouries with new models of an obsolescent class. Even the French, whose rifle was not only the oldest but also possessed a type of magazine long discarded by others, made no attempt to replace it by a weapon of the class of the British and American rifles. When war came, all Powers were waiting on events.

In the war itself the machine-gun proper very soon and decisively asserted itself, driving the simple rifle into the back-

<sup>1</sup> For further information see AMMUNITION and SIGHTS.

ground. Further, trench warfare took unforeseen shapes. Grenades, trench mortars, bombs and man-to-man weapons, even clubs and daggers, became normal infantry arms in minor and subordinate combats, while in the battle proper it was the artillery and the machine-gun rather than the firing-line of rifle-armed infantry that governed the issue both in attack and in defence. Thus when, from the latter part of 1916 onwards, the "break-through," with its sequel of free infantry fighting in the background of the broken-through trench systems, became the ideal of tactics, the main infantry weapon was inevitably the machine-gun in some form. And thereupon the machine-gun of the pre-war and early war period began to develop on two distinct lines—the heavy machine-gun with its own rôle and characteristics (see MACHINE-GUN), and the light machine-gun or infantry machine-gun. When this evolution set in, the machine-rifle or automatic rifle (some forms of which were already in use as machine-guns, especially with aircraft) was more or less ready to take up the place allotted to it by tactics.

The light machine-gun or machine-rifle—"infantry machine-gun" is a better designation than either for the class as a whole—is differentiated from the heavy machine-gun, technically and tactically, by being: (a) portable by one man; (b) unprovided with a mounting in the proper sense; (c) as inconspicuous in action or movement as an ordinary rifle; and (d) limited for various reasons to short bursts of fire. On the other side, as against the rifle, it possesses: (a) fire power with which no hand-operated weapon can compete, which indeed is equivalent for some moments at a time to that of the machine-gun proper; (b) an accuracy that, while less than that of the heavy type, is greater than that of the rifle, owing to the absence of trigger jerk and disturbance of the firer by recoil and to the fact that a muzzle support is (usually) provided; (c) ease and certainty in the matter of fire control, a mechanical organ in the hands of one man being far more manageable in the confusion of battle than a squad of extended riflemen. These advantages it gains, of course, at the expense of being more cumbersome, more delicate in mechanism and more expensive than the rifle, and it requires a fuller ammunition supply, or may do so. Further, it lacks one of the characteristics of the old infantry firearm—it cannot serve as the haft of a bayonet, and thus the infantryman ceases, at least for the time being, to be self-sufficing, and infantry organization at its lowest level returns to the 17th-century form, in which a fire element and a shock element are combined in the tactical group rather than in the individual soldier.

The characteristics of automatic rifle and light machine-gun fire, which thus become the most important element of infantry tactics, are briefly as follows. (For convenience, the term "automatic rifle" will be applied to the lighter and that of "light machine-gun" to the heavier members of the class under consideration. The definition by weight adopted in the following article fixes the frontier between the automatic rifle and the light machine-gun at about 20 lb.)

The trajectory of an individual round, whether fired from a rifle, an automatic rifle, a light machine-gun or a heavy machine-gun, is the same for the same ammunition and barrel characteristics, though its relation to the object aimed at will vary to some extent according to steadiness of man or mounting, smoothness or shock of recoil and other factors. On the other hand, the cone or sheaf of fire formed by a group of rounds will be denser with the automatic rifle and denser still with the light machine-gun than it is with a number of rifles representing the same volume of fire per unit time. The grouping of shots is densest of all in the case of the heavy machine-gun fired from a steady mounting.

In proportion, therefore, as the steadiness in position, due to man, ground or mounting, enables an automatic rifle or light machine-gun to group its shots more and more closely, these weapons tend to acquire more and more of the peculiar tactical powers of the heavy machine-gun—the ability: (a) to support close-fighting infantry groups by overhead or acute flanking fire; (b) to pour a direct and intense fire into small but dangerous posts of the enemy, such as machine-gun nests; (c) to enfilade

enemy trenches and harass bridge approaches, cross-roads, and other points of very small area by day or night. It may be admitted at once that no existing light machine-gun and, *a fortiori*, no automatic rifle, is fully capable of (a) and (c), and in particular of overhead fire or fire through intervals between moving or fighting bodies of friendly troops without endangering them. However, in (b) the light machine-gun is ballistically scarcely inferior to the heavy machine-gun. This is its true function, which it performs as a rule better than the heavy, because its mobility allows of a closer approach, easier observation and freer choice of position. The automatic rifle also possesses this power in some measure, but the light weapon of the future to be evolved from the two types must, before unity of type is acceptable, be made quite as capable of performing this tactical service as is the light machine-gun of to-day. At present the automatic rifle seems to be looked upon in some quarters as a weapon to be used normally as a semi-automatic, firing perhaps 50 or 60 rounds where the bolt-action rifle would deliver 10 and to that extent economizing men, reducing confusion, and minimizing casualties in the firing line, but in the last analysis always a rifle in the tactical sense. Its automatic power is reserved for special emergencies, just as, at the beginning of the evolution of the magazine rifle, the magazine was regarded as a reserve of fire power added to a single-loader.

Considering, next, volume of fire, we can safely say that for practical purposes all automatic rifles and light machine-guns have or can be made to have the same rapidity of fire as the heavy machine-gun. The rapidity is purely a function of the design. Whether recoil-operated or gas-operated, the cycle of operations is gone through as fast as the mechanism can take up the motive impulse. On the other hand, the possibility of maintaining the automatic rate for long without damaging the mechanism depends on (a) the solidity of the working parts; and (b) the capacity of the barrel to resist overheating. In both respects the light machine-gun and the automatic rifle are definitely inferior to the heavy. Solidity of working parts and the incorporation in the design of cooling devices both involve deadweight, and it is the designer's first object to eliminate deadweight. In the automatic rifle not only are weights of parts limited but cooling devices are omitted altogether.<sup>1</sup> The possibility of automatic continuous fire is therefore definitely sacrificed. In light machine-guns, on the other hand, the working parts are not greatly different in solidity from those of heavy machine-guns, and some form of cooling device—radiator, circulator or both—is invariably fitted. The extra weight translates itself into greater power of sustained fire. With a positive cooling system, such as the water-jacket of the German L.M.G.08/15, the volume of fire from a light machine-gun is practically equal to that of a heavy, if tactical conditions allow of equal ammunition supply to each. Even the air-cooled guns are capable of delivering many hundred rounds without a pause other than those for changing magazines or belts. It is true that the development of full fire power for several minutes continuously is exceptional and even very exceptional, and it is a matter of opinion how much importance should be attached to this factor relatively to others in the arm of the future. But it seems clear, in any event, that the infantry machine-gun which constitutes the backbone of the attack or the defence ought to possess, at least at the shorter ranges, that power of focussing a storm of bullets on the enemy's machine-gun group, nest, or other centre of effort as soon as it is located. Otherwise the attack or counter-attack must wait for the heavy machine-guns to come well up, or at least to wait till exact information as to the target and the situation has been communicated to them.

This line of reasoning would exclude the automatic rifle altogether but for certain other considerations. The blotting-out by destruction or neutralization of well or strongly posted enemy groups in key positions is not the only function of the infantry machine-gun. It prepares by its fire every local advance of the groups of its own side, whether against or past important hostile nuclei or against simple parties of infantry using fortuitous

<sup>1</sup> Except in the Chauchat, which is on the border line as to weight.

cover, which constitute the rest of the hostile "line." It is the latter which is the average, though not the decisive, incident in mobile warfare, especially when, as in 1918, the principle is to "drive a nail where it will go." In these average incidents sustained fire is the rare exception—German light machine-gun squads in the spring offensive of 1918, for instance, seem to have found that 2,000 rounds daily per L.M.G. sufficed—and mobility is of supreme importance as the machine-guns must push along as fast as the rest of the infantry, and, indeed, get ahead of it in many cases. This is a strong, and indeed the principal, argument in favour of the automatic rifle of less than 20 lb. weight, as against the light machine-gun of 20-40.

In sum, therefore, the light machine-gun, by reason of its greater weight and steadiness, can deliver a fire of greater accuracy and more sustained intensity than the automatic rifle, and so can perform functions for which the heavy machine-gun would otherwise have to be called in. The automatic rifle, on the other hand, possesses a greater mobility than does the light machine-gun and can for a few moments at a time develop a fire power practically as heavy. In four-fifths of a day's work in battle, then, it is as useful as, or more useful than, the light machine-gun. But the last fifth, often more important than the rest put together, it cannot undertake with much hope of success. Both have the disadvantage that they must be fed with ammunition in very difficult conditions. They must, therefore, be squad weapons and not personal weapons, and there is a tendency for the squad to group itself about the gun and so to reveal itself for what it is. Both, on the other hand, have the advantage that very few of these squads are needed, as compared with rifle-armed infantry, to attack or defend a given front.

On the whole, it seems probable that a type of the future, evolved from both, will take the form, not of the lightened machine-gun, but of the automatic rifle provided with increased magazine capacity, a cooling device, and a mount sufficiently steady, with the weight of the gun, to give a bullet grouping at short ranges as close as that of the heavy machine-gun at longer.

The rise of the light machine-gun to importance as the main weapon of the infantry battle has been followed by another development of some interest, viz. a change of principle in what may be called the personal armament of the infantry soldier. Hitherto self-sufficing, but now become a member of a gun detachment, he has felt the need of possessing some handy weapon of his own which would give him intense fire power in emergencies. The same is the case with the artilleryman and, in the present day, with many specialists such as range-takers, observers and others, who have to work in the front line but are not armed with the normal battle weapon. For these, first an increase in the capacity of the pistol magazine was tried, and later an altogether new class of weapon was designed—the machine-pistol, which is a fully automatic arm of the carbine or long pistol kind, capable of firing pistol ammunition as fast as a heavy machine-gun fires rifle calibre ammunition. Such weapons may also usefully replace the light machine-gun itself in certain conditions, e.g. bush or mountain warfare. Some examples of this new class of arm are described below.

As to whether the semi-automatic rifle—that is, the military rifle fitted with self-loading mechanism but fired by the trigger shot for shot—will become a universal infantry weapon, opinions differ. On the whole, it seems unlikely that it will do so. On the one hand, for group action the light machine-gun or perfected automatic rifle is definitely superior in accuracy, volume, and control of fire to an equivalent number of semi-automatic rifles in individual hands, whatever the discipline and team work of the individuals. On the other hand, as a personal armament for fighting at close quarters the new machine-pistol is superior in intensity of fire and at least equal in handiness. The semi-automatic rifle may develop as a weapon for sniping and skirmishing, and as the soldier's personal armament in theatres of war where the country is very open and troops are required to do a good deal of individual patrolling and stalking. Of these services, however, all except sniping can be performed by the machine-pistol; and, in sum, the semi-automatic rifle

seems likely as a military arm to become a sniper's rifle pure and simple—the military analogue of the sporting rifle, for which the semi-automatic principle is already well established.

Speculation as to the nature of the cavalry firearm of the future is now difficult, depending as it does on the tactical question of how far dispersion will be carried in the dismounted fire fight. (C. F. A.)

#### PRACTICAL DEVELOPMENTS

The improvement of the rifle has been confined mainly to the development of auto-loading, or semi-automatic, rifles for both military and sporting purposes, and the development of the automatic or machine-rifle for military purposes.

The semi-automatic shoulder-rifle has become an efficient and reliable weapon for sporting purposes, but no military weapon of this type has been adopted by any of the leading powers to replace the bolt-action shoulder-rifle, although some fairly successful weapons have been produced. The principal difficulty in the way of perfection of an arm of this type is the weight limitation. The present bolt-action rifles are considered by many designers to be as light as is consistent with the pressures obtained with modern powders, and the automatic action can only be obtained through additional parts, and consequently additional weight. Successful automatic rifles of 12-20 lb. weight have indeed been produced. Such rifles are somewhat less heavy than the light machine-gun, the latter being defined as an automatic, rifle-calibre weapon, with a tripod as muzzle support weighing from 20 to 30 lb. complete, and it is possible that further developments in the type may lead to its superseding the light machine-gun as above defined.

*Bolt-Action Military Rifles.*—It has already been noted that no important progress was made in the design of the bolt-action rifle during the World War. Quite apart from the manufacturing difficulties attending upon an alteration of model in the midst of a great crisis, and setting aside also the changes in the tactical relations of rifle, gun and machine-gun in the war, the rifles used by the various belligerents were so nearly equivalent that no one possessed any advantage over the rest which could not be compensated for by slightly better training or slightly higher moral on the other side. And not only was the invention of necessity wanting, but also the conventional type of rifle had reached a point of development beyond which it was difficult to see possibilities of radical improvement.

Substantially, then, the rifles in use at the end of the war were the same as those in use at its beginning, and this is the less surprising as many peace-time criticisms levelled at one or another model proved to be useless, or practically unimportant, in war. Thus, rifles looked upon as obsolete revealed unsuspected good qualities in the severe test of war service, and modern rifles failed to show the superiority expected. The German Mauser had been popularly credited with being the best military shoulder arm; while the British short Lee-Enfield had been severely criticized on the score of its weak body and poorly designed bolt. Yet, under service conditions, the performance of the latter was excellent; the simple action, good balance, and rapidity with which it could be worked compensating for the superior ballistic qualities of the German arm. Similarly, the French Lebel, one of the oldest service rifles (1886-93), has been looked upon as being outclassed by modern arms, it being the only military rifle with a tubular magazine; yet this rifle with the "Balle D" cartridge has greater velocity and greater striking power at ranges in excess of 800 yd. than the American Springfield, which has 360 f.s. greater initial velocity. In only one instance, apparently, did a rifle prove so unsuitable that it was withdrawn from use. The Ross rifle, the original arm of the Canadian forces, while a good sporting and target rifle, proved unsatisfactory in the mud and dirt of trench fighting.

Another factor which tended to stabilize the rifle in its existing form was the interchangeability of rifle and machine-gun ammunition. Before the war there was a distinct tendency towards reducing the calibre of the rifle and employing a lighter bullet, in order to obtain flatness of trajectory at ranges within about 800 yards. But the modern light-weight high-velocity bullet

loses its velocity very rapidly, which renders it less suitable than a heavier bullet for employment in machine-gun work, where effectiveness at long range is required. So long, therefore, as the ammunition of rifles and machine-guns remains interchangeable it is probable that no further reductions of calibre and bullet weight will take place. At the same time, the development of the heavy machine-gun itself may quite possibly call for not merely the retention of the present common calibre but an actual increase of calibre beyond what is admissible for the rifle. The principle of interchangeable ammunition has recently been questioned by some experts who would prefer that each class of weapon should be free to develop along its own lines; and already experiments have been carried out in the United States, not indeed with two calibre, but with two bullet weights, a bullet of 180 grains being designed for the machine-gun (and for occasional use for special purposes in the rifle) while the old bullet of 150 grains is retained for the shoulder weapon.

The only new model service bolt-action rifle produced by belligerents during the war on a large scale was the British rifle, .303, pattern 1914, which was later adapted to .30 U.S. ammunition and manufactured for the United States; about 2,500,000 rifles of this type being produced in that country during the eighteen months preceding the Armistice.

*British Rifles of the War Period.*—Before the war, the British service rifle, the short Lee-Enfield of .303-in. calibre, had been subjected to a good deal of criticism, and the War Office, after much experimenting with various types of cartridges, found that it was not possible to obtain as high a velocity with this rifle as was desired. An improvement was effected, however, in the adoption of the Mark VII. ammunition, the pointed bullet of which weighs 174 grains instead of 215 grains as in the Mark VI., the muzzle velocity being 2,440 f.s., with a chamber pressure of 45,000 lb. This ammunition, however, did not give the ballistic qualities desired and the design of a new rifle was taken up. A rifle was finally evolved with a bore .276 in. in diameter, and chambered for a rimless cartridge, giving a muzzle velocity of about 2,800 f.s., and a chamber pressure of 51,000 lb., and it is probable that this model would have been further perfected and adopted but for the beginning of the war. Military considerations then prevented its adoption in its original form, and it was modified to take the existing Mark VII. .303 ammunition, and manufactured in the United States as the "British Rifle, Pattern 1914." The short magazine Lee-Enfield with Mark VII. ammunition, however, remained the standard British arm throughout the war; though the new rifle was also used.

Upon the entrance of the United States into the conflict, as a number of American factories were equipped to manufacture this rifle, it was again modified to accommodate the U.S. service ammunition and used as a substitute for the calibre .30, model of 1903 (Springfield), under the name of the "U.S. Rifle Model of 1917." As chambered and bored for the U.S. ammunition, the rifle had approximately the same ballistic qualities as the Springfield. The British and American models of this rifle are the same in their essential features, except that the latter has not the long-range (dial and aperture) sights of British rifles. A remarkable feature common to both rifles is the position of the rear sight between two protecting lugs on the bridge of the receiver. This position of the rear sight gives a distance from back sight and fore sight of 31.76 in., that is, almost exactly over the trigger instead of in the customary position, a hand's breadth or more in front of the magazine. Further details will be found in the article SIGHTS. The length of the rifle overall is 46.3 inches. The weight without bayonet is 9 lb., 3 oz.; the sword bayonet is about 22 in. long (blade 17 in.) and weighs 15 oz. The magazine holds five cartridges which are loaded from a clip. The bore has five grooves, left-hand uniform twist, one turn in 10 inches.

The action of this rifle is as follows (figs. 1 and 2). The cycle of operations is assumed to start with the extraction of a fired cartridge case. The bolt handle is raised and the cocking piece forced to the rear in the bolt by the half-cocking cam. This also withdraws the striker into the bolt. When the locking lugs on the bolt are clear the extracting cams on the bolt and receiver engage and the continued

rotation of the bolt retracts the latter and loosens and partly withdraws the cartridge case (primary extraction), the extractor and sleeve being prevented from turning by the receiver. When the limit of the turning movement in the bolt is reached, it is drawn to the rear, withdrawing the empty cartridge case; during this movement the cocking piece rides over the sear nose and depresses it; the safety stud rises in the clearance cut in the bolt. When the cocking piece clears the sear nose, the sear spring returns the sear to normal position. The slotted locking lug (left hand) of the bolt now reaches the ejector, the latter protruding in the slot sufficiently to strike the rear of the empty case and eject it to the right. After a further slight backward movement the bolt lug comes in contact with the bolt stop, preventing further movement. If the magazine is now empty the follower rises and its rib prevents the closing of the bolt. If not, the magazine spring has pushed another cartridge up and into the path of the bolt, the forward movement of which forces it forward and up over the cartridge ramp.

During the early part of the closing movement of the bolt, the ejector is pushed outward by the bolt. Later, the sear notch in the cocking piece engages the sear nose, and is arrested. The bolt then slides forward over the striker, further compressing the main spring.

When the rotation of the bolt by the handle begins, the locking lugs engage the locking cams, and force the bolt home, seating the cartridge, and further compressing the main spring. The rotation of the bolt restores the half cocking cam, so that it is out of the path of fall of the cocking-piece lug.

The bolt is now locked, the mainspring is fully compressed, and the cocking piece is held by the sear nose.

When the trigger is squeezed, the bearing of the trigger first acts on the bearing of the receiver, slowly depressing the sear nose. Then the heel of the trigger engages the receiver, and completes the depression of the sear nose, which ends in the release of the cocking piece by the sear nose. The striker is then acted upon by the mainspring, and, striking the primer of the cartridge, detonates the same.

FIGS. 1 and 2.—British Rifle (Pattern '14) U.S. Model of 1917.

During the depression of the sear nose, the safety stud rises through the hole in the bottom of the well and enters the interlock slot in the bolt. If the bolt is not fully locked, the interlock slot will not register with the safety stud, and the trigger cannot be pulled.

*United States.*—When the United States entered the war its standard rifle was the "U.S. Rifle, Model of 1903" (Springfield). There were only about 600,000 of these on hand, and very limited possibilities of immediate expansion. To obviate delay, therefore, it was decided, as above mentioned, to adopt the British Pattern '14 rifle which had been manufactured in the United States in large quantities. This rifle, modified as previously noted, was used very successfully by a large portion of the U.S. troops; only the regular army and part of the National Guard continuing to use the Springfield. The Springfield, however, is still (1921) the official arm, the 1917 rifles having been withdrawn after the Armistice.

*Other Nations.*—The Lebel magazine rifle, calibre 8 mm., model of 1886-93, is still the standard arm of the French infantry. The magazine is tubular, lies under the barrel, and holds eight cartridges which are loaded singly. The carbine, model of 1890, and the rifle, model of 1907-15, were also used to a considerable extent. These are magazine rifles, having a one-piece stock and a bolt with a turning head. They are loaded with a charger containing three cartridges. A box magazine was later designed for these rifles, increasing the capacity to five cartridges. Several

other types were used by the French, many of the old single-loading "Gras" rifles of the 1874 model being adapted.<sup>1</sup>

Mauser rifles in different calibres were used by *Germany, Turkey, China, Portugal, Serbia and Brazil*.<sup>2</sup> The Japanese "Arisaka," or "38th Year," also has a Mauser action. Many of these rifles were purchased from Japan by Russia early in the World War and also by Great Britain for training purposes. It was reported that since the Armistice Japan has increased the calibre both in new rifles and in the existing stock from 6.5 mm. (256) to 7 mm., the reason given for the change being that the 6.5-mm. bullet is too small to develop sufficient wounding power. This calibre is used by several other nations and is the smallest used in military rifles. The change is interesting, since the tendency had been towards reduction of calibre.

The standard arm of the Russian infantry is the "Three line" magazine rifle, 7.62-mm. (.3-in.) calibre. A new type of ammunition has been adopted for this rifle, having a pointed bullet weighing 148 grains and giving 2,820 f.s. velocity with 50,000 lb. pressure. The Russian Government also bought large quantities of Winchester, model of 1895, magazine rifles of the same calibre, the only lever-action magazine-rifle used in the war.

*Austria-Hungary* used the 8-mm. Mannlicher, "Straight Pull" rifle, model 1895, and carbine. Mannlicher type rifles were also used by *Italy, Bulgaria, Rumania and Greece*. The *Belgians* used the magazine rifle, calibre 7.65 mm., model of 1889, which has a Mauser action. The latest ammunition for this rifle has a pointed bullet weighing 154 grains with a velocity of about 2,740 f.s. The *Swiss* Schmidt-Rubin rifle has been redesigned to chamber a new rimless cartridge having a 170-grain streamline bullet with a velocity of 2,660 f.s.

#### SPECIAL BOLT-ACTION RIFLES

**Snipers' Rifles.**—Several types of rifles have been developed by the various Powers for the use of "snipers," whose function it is to pick off with single shots individual scouts, officers, men of working parties, enemy snipers, etc. Snipers work as a rule in pairs wherever feasible, one acting as an observer, the other as a rifleman. The rifle used for this purpose is usually a very carefully selected specimen of the standard service rifle, fitted with telescopic sights of low power, or some other variety of optical sights, though plain sights are sometimes used. The British snipers used the short Lee-Enfield rifle with various forms of telescopic and other optical sights, and also the 1914 rifle with a special back sight. The U. S. rifle is fitted with a Warner and Swasey telescopic sight, 6-power, 43° field, which is attached to the standard rifle by side brackets, but this combination is not entirely satisfactory and a new telescope and method of mounting are being developed. The German sniper's rifle was the standard Mauser with brackets fastened by screws to the top of the magazine to take a Goerz, Luxor, or Zeiss telescope, generally of 2½ or 3 power. The mounting of the telescope over the bolt and magazine makes it necessary to use the rifle as a single-loader and prevents the use of the regular sights while the telescope is attached. This method is, however, preferred by riflemen as aim may be taken with the cheek against the stock in the usual manner; the superior accuracy obtained offsetting these disadvantages. In the German sniper's rifle the telescope can be very quickly removed from its brackets and the rifle used the ordinary way.

<sup>1</sup> The German infantry throughout the war carried the 1898 pattern Mauser (7.9 mm.). The cavalry carbine of the same pattern and calibre was also occasionally used by infantry as well as by cavalry serving dismounted in the trenches, and by the personnel of light machine-gun squads. During the trench-warfare period of the war, spare magazines holding 25 cartridges were designed for attachment to the underside of the ordinary magazine, in order to obtain an increased volume of fire for emergencies; these were, however, clumsy and unpopular with the troops, and were not generally used. The only important modification of the standard arm was the introduction in summer 1915 of a short rifle (43.5 in.) known as the Erfurt rifle. This has the same trench action, calibre, and magazine as the 1888 rifle, and, apart from the reduced length, differs from it only in having the sliding parts of the breech covered by a dustproof metal casing, the barrel cased in wood (as in the British and other short rifles) and the muzzle fitted with a flash-reducing attachment. The bolt-handle is curved down close to the stock. This weapon was only issued for service in the last months of the war, but seems to have been retained as a standard weapon in the post-war army and police. Troops of older categories employed in garrison and line of communication duties had the old magazine rifle of 1888 (7.9-mm. calibre).  
<sup>2</sup> The new Brazilian 7-mm. ammunition has the highest muzzle-velocity of any military small-arms ammunition, although several of the new cartridges closely approach it.

**Periscopic Rifle Holders** or "Sniperscopes" have been designed and used with some success, although it cannot be said that these devices were ever popular or capable of very accurate or rapid fire. The tendency when using them is to shoot high and they are only reasonably accurate at ranges up to 200 yards. In the instrument developed by the Munition Invention Department of the British Government (fig. 3) the periscope (aa) and shoulder piece (c) are rigidly combined with each other and with a shoe (d) which takes the butt of the rifle. A trigger on the shoulder piece is connected to the rifle trigger by a cord (ee). Pivoted to the right side of the shoe is a system of levers (bb) which enables the firer to open and close the bolt by means of a handle close to his right hand. The periscope itself is a simple mirror-periscope.

FIG. 3.—Periscopic Rifle Holder (British Type).

**Anti-tank Rifle.**—The German anti-tank rifle (fig. 4) is a single-shot calibre 13-mm. Mauser action rifle brought out as an emergency weapon<sup>3</sup> and intended to serve as a stop-gap pending the construction of a 13-mm. machine-gun. The weapon is intended for short-range work only, as the sights are graduated to only 500 metres. It is very heavy (37 lb.) and has a total length of nearly 66 in., the barrel being 39 in. long. It is provided with a bipod. The bullet, which weighs 801 grains, is pointed and armour-piercing, has an initial velocity of about 2,450 f.s., and a penetration of 20 millimetres in the best steel is claimed at a range of 500 yards. It is, however, very heavy for a portable arm, and, being a single-shot weapon, it has a very slow rate of fire. On account of the heating of the barrel and the heavy recoil, the fire cannot be sustained for more than 20 shots at a time. Each rifle was served by two men, carrying 124 cartridges as well as the rifle and accessories and their personal armament. The rifles were used in squads of three rifles, or singly, or in co-operation with heavy machine-guns using armour-piercing bullets, according to circumstances. The Germans had a high regard for this weapon.

FIG. 4.—German Anti-Tank Rifle.

**High-power Rifles.**—Sporting rifles with an initial velocity of 3,000 f.s., or slightly more, are now in use. These rifles have no particular feature except the additional strength necessary to withstand high pressures. The so-called "explosive" effect of high-velocity bullets upon striking make them extremely effective for sporting purposes.

#### SEMI-AUTOMATIC RIFLES

As already mentioned, efforts are being made to produce a semi-automatic shoulder-rifle to replace the bolt-action rifle. The successful sporting weapons of this type which have been devised are not considered suitable for military use, as the powder pressures and velocities obtained from their cartridges are much below those obtained with military ammunition. Sporting rifles are not subjected to the severe conditions that are usually encountered by the military

<sup>3</sup> The order for a design was given in Dec. 1917 and in spite of the manufacturing difficulties which naturally presented themselves with an arm of such unusual proportions, the Mauser works were able to begin quantity supply in April 1918 (Schwarte, *Technik im Weltkrieg*, p. 21). (C. F. A.)

arm; the sportsman seldom fires more than three or four shots in quick succession and is usually in a position to give the self-loading rifle the care which its more complicated mechanism requires.

The principal requirements in a semi-automatic rifle are that the rifle shall not weigh more than nine or ten pounds, and shall have a simple mechanism which will stand the shock of service ammunition and the wear and tear of campaigning. The weapon must be capable of being used either automatically or by hand as an ordinary rifle, and for the rest must possess all the qualities now demanded of a good bolt-action rifle. The automatic action, therefore, is not considered a substitute for any of the qualities of the present shoulder-rifle. No semi-automatic weapon so far designed has fulfilled these conditions to such a degree that it has been adopted in place of the bolt-action rifle. The Mondragon, a Mexican invention, has, however, been used by the Mexican Government to some extent, and in a modified form. A modification of this weapon was also used by Germany in the war, notably for the armament of aeroplanes. Two French models, the St. Etienne and the "Carabine Meunier," were brought out toward the close of the war, but not extensively used.

FIG. 5.—Winchester Auto-Loading Rifle.

The U.S. Ordnance Department recently (1920) held competitive tests, and further developments and tests have been made.

The principal advantages expected from the semi-automatic rifles are: increased rapidity of fire, less physical labour on the part of the soldier, and better moral, due to the knowledge that he can devote all his attention to the enemy and shoot without exertion or haste when necessary. On the other hand, the desirability of the semi-automatic rifle is not universally conceded. Some authorities consider the rate of fire of the present rifle to be quite as high as is consistent with accurate shooting and lay stress on the difficulties of ammunition supply.<sup>1</sup>

**Semi-automatic Sporting Rifles.**—The Winchester auto-loading system for rifles (fig. 5) utilizes the inertia of a heavily weighted bolt working against the compression of a coiled spring in the fore end to delay the rearward motion of the bolt at the moment of firing until the bullet has left the barrel. After this inertia is overcome, there still remains enough force to the recoil to move the bolt to the rear, eject the empty cartridge case, cock the hammer against the compression of the hammer spring, and finish the compression of the bolt

FIG. 6.—Browning Auto-Loading Rifle.

spring. When this has been accomplished, the bolt moves forward actuated by the bolt spring and feeds another cartridge into the chamber. A pull of the trigger now fires another shot. This rifle is made in various calibres, the most powerful being .401 in. The 200-grain bullet in this size gives a muzzle-velocity of 2,132 f.s. and has a muzzle-energy of 2,020 foot pounds. The French Air Service used this type of rifle to a limited extent in the armament of aeroplanes.

The Browning auto-loading system (fig. 6), used by Remington (U.S.A.) and the Fabrique Nationale (Belgium), differs from the Winchester in that the barrel (1), breech bolt (2), and bolt carrier (3) are locked together at the moment of firing, these parts recoiling together against a powerful spring (7) in a casing surrounding the barrel and in which the barrel slides. The rearward motion pushes the hammer (4) backward, cocking the action and compressing the

<sup>1</sup> The incorporation of the light machine-gun in the small fighting unit of infantry bears on this question.

(C. F. A.)

action spring (5) through the link (6) and the recoil spring (7). A buffer spring (8) also serves to retard the recoiling parts. At the completion of the backward motion the bolt-carrier latch (9) springs into a notch (10), locking the bolt in its rearmost position. The barrel and bolt carrier now start forward actuated by the recoil spring around the barrel; the bolt carrier after moving a short distance is held by the bolt-carrier latch; the barrel continues its forward movement, turning the bolt by means of a helical cam slot in its side and unlocking it. The empty cartridge case is held until the forward motion of the barrel withdraws it from the chamber, after which it is ejected. When the barrel has reached its forward position, the barrel extension (11) has forced the barrel lock down. This reacts against the bolt-carrier latch and allows the bolt carrier to be pushed forward by the action spring (5), carrying a fresh cartridge from the magazine (12) into the chamber and rotating the bolt so that the locking lugs are forced into their seats in the barrel extension, thus locking the bolt to the barrel.

FIG. 7.—Mondragon Semi-Auto Rifle.

This rifle is made in .25-in., .30-in., .32-in., and .35-in. calibres. In the last-named the 200-grain bullet has a muzzle-velocity of 2,020 f.s. and an energy of 1,776 lb. The magazine is loaded with a clip of five cartridges similar to military rifles. Owing to the locked bolt and recoiling barrel, high pressures can be used in this arm. The cartridge is reduced in diameter or necked down for the bullet. The mechanism is, however, much more complicated than in a rifle where the breech only is blown back.

**Semi-automatic Military Rifles.**—The Mondragon semi-automatic military rifle (fig. 7) is the invention of Gen. Mondragon of the Mexican army. It was invented about 1891 and developed to its present state by Germany about 1915. The rifle is gas-operated, the gas being taken from a port in the barrel. It weighs about nine pounds, has the general appearance of the ordinary service rifle, is fitted for a bayonet, and is made in 7-mm. calibre. The characteristic feature of this rifle is the bolt mechanism, which permits the rifle to be used either as an auto-loading weapon or as a hand-operated shoulder rifle. The bolt (1) has three locking lugs on the forward end of the bolt and four on the rear end of the bolt, which are locked into locking recesses of the receiver (2). The bolt is made to rotate by two helical cam slots (3) in the side; two cam lugs, which are carried by the bolt handle, work these slots. The bolt handle is connected with the gas piston so that when the powder gases enter the gas chamber and drive the piston to the rear, the bolt handle is carried with it and causes the bolt to rotate and unlock, and move to the rear, extracts the empty case and compresses the recoil spring (4) which is coiled round the gas cylinder, and drives the mechanism forward after it has been arrested in the rear by the buffer spring. A gas adjustment is provided to regulate the amount of gas delivered to the gas cylinder, so that the rate of working can be to some extent regulated. The magazine has a capacity of 10 rounds. Another form of magazine, for aircraft purposes, is of the Luger "snail," or barrel type (see PISTOL), and holds 30 rounds. The rifle is provided with a separate hammer (5) which is linked up with the trigger mechanism as

FIG. 8.—St. Etienne Semi-Auto Rifle.

shown in the section. The change to hand-loading is done by means of a releasing catch on the bolt handle which disconnects this from the gas piston. The gas port in the barrel may also be closed by means of a valve. A safety device (6) is provided which disconnects the trigger if carried in a safe position.

The German pattern was officially known as the Aviator's Automatic Carbine (*Flieger-Selbstlader Karabine*), model 1915, and was chiefly and successfully used for the purpose indicated by its name. It was also for a time tried as an artillery carbine, but for this purpose it proved unsuitable, in that it failed to stand the rough usage and careless handling of field warfare.

The *St. Etienne Semi-automatic Rifle* (a French "semi-automatic rifle, model 1918") is a gas-operated semi-automatic rifle which weighs about 11½ lb., is about 52 in. long, and has an ordinary rifle sight and bayonet fitting (fig. 8). It takes the French Lebel 8-mm. cartridge. The magazine which has a capacity of five cartridges is charged through the bottom of the magazine housing (8), which is hinged.

When the bolt handle, which is attached to the bolt (9), is pulled to the rear, the hammer (10) is forced to the rear against the action of the hammer and sear spring (11) until the sear (12) is engaged in the sear notch in the trigger (13). The rearward motion of the bolt compresses the recoil spring (15) which, when the bolt handle is released at the rear position, goes forward and drives the next cartridge into the chamber, while the hammer is held in the rear position by the sear and trigger ready for firing. The trigger is pulled and released for each shot, but extraction and ejection of the fired cartridge case and the feeding of the new cartridge are automatic. When the trigger is pulled, the sear is released and allows the hammer to go forward and strike the firing pin which ignites the cartridge. When the cartridge is ignited a portion of the powder gases pass through the gas port (16) into the gas cylinder (17) which drives the gas piston to the rear. The gas piston is linked with the bolt mechanism through a slide which transmits the force of the gases to the bolt. This serves to unlock the bolt and drive it to the rear to extract and eject the empty case and to compress the action spring and cock the hammer for the next shot. The bolt body is forced to the rear by the slide which is attached to the gas piston, and also linked with the bolt head (18) through rotating cams which rotate the bolt head sufficiently to clear the bolt head locking lugs of the locking recesses in the receiver.

#### AUTOMATIC RIFLES AND LIGHT MACHINE-GUNS

As has been stated in an earlier part of this article the development of new tactical methods and conditions in the World War soon produced a demand for a light machine-gun or automatic rifle which could keep up with, and participate in, an

Fig. 9.—Browning Automatic Rifle.

infantry attack at every stage of its progress. Various types of weapons were adopted for this purpose and classified as light machine-guns or automatic rifles. There is no distinct separation of these types, the term "light machine-gun" being usually applied to machine-guns weighing 20 to 30 lb. fired from a bipod and used for fairly sustained direct fire. Practically all types are air-cooled by means of a heavy barrel with annular rings or a radiator. The automatic rifle, while it is sometimes supplied with a bipod, may be fired from the hip or shoulder and

The rifle is light and portable, weighing only 15½ lb. and being only an inch or two longer than the short military rifle. It can be handled by one man as a shoulder rifle. As it is heavier than the ordinary military rifle, the recoil is very slight, and a man can fire the gun continuously without distress.

By means of a change lever, the action of the gun is made either semi-automatic (the trigger being pulled for each shot), or automatic (being continuous as long as the trigger is kept pressed and cartridges are supplied).

As a semi-automatic rifle it is very effective. As the trigger pull is as light as that of an ordinary military rifle, it is possible, with practice, to fire 100 shots a minute without unduly tiring the finger. Used in this manner every shot can be well directed, which makes the gun in some conditions as effective as the heavy machine-gun, with a considerable saving in the amount of ammunition expended.

The gun, firing automatically, has a rate of between 450 and 500 shots per minute. The speed can be regulated to a certain extent by adjustment of the gas regulator. The weapon can be used as freely when firing automatically as when firing single shots, the firer lying down, standing, or advancing at will.

When a magazine has been emptied it can be dropped out of the gun by pressing the magazine release in the trigger guard and a full magazine quickly pushed into place with one hand, so that very little time is lost in changing magazines.<sup>1</sup>

The mechanism is very simple and also extremely durable. Tests have been made where over 50,000 rounds have been fired out of the same rifle without any of the parts showing distress.

The rifle is gas-operated. A portion of the powder gases, while under pressure, are trapped near the muzzle of the gun and are caused to act upon a gas piston. The pressure of the gases forces the piston and slide to the rear against the action of the recoil spring, until stopped by the buffer, when the recoil spring returns the mechanism to its forward position.

The receiver (21) in which the barrel is firmly screwed contains the principal mechanism of the gun. The bolt-supports (23), upon which the bolt slides, are riveted in position. The bolt guide (25) fits in a slot cut in the receiver wall and is held in position by the bolt guide spring. The change lever stop (26) projects from a hole in the receiver wall in the path of the change lever and must be depressed before the change lever can be moved to the safe position. The buffer tube (28) behind the receiver contains an arrangement of friction cones, cups and springs. On the left-hand side of the receiver

Fig. 10.—Browning Automatic Rifle.

is capable of delivering limited sustained fire. Its weight varies from 14 to 20 pounds. The German "08/15" and "08/18" and the Bergmann, Lewis and Benet-Mercie are generally spoken of as light machine-guns. The Browning, Chauchat, light Hotchkiss and Madsen are examples of automatic rifles.

The *Browning Automatic Rifle* (figs. 9 and 10) is the standard automatic rifle of the United States army.<sup>1</sup>

<sup>1</sup> Brought out in 1917, just after America entered the war, and available in small numbers by Feb. 1918, it was not employed in battle till Sept., Gen. Pershing having become so convinced of its superiority over all other types in use that he preferred not to expose it to capture and copying by the enemy till the American army had been supplied with it on a large scale and had reaped the fruits of its superiority in a great battle. In effect, none was used before his offensive battles of Sept. but 4,608 were in action between that date and the Armistice. (C. F. A.)

are grooves in which the operating handle (34) slides. The forward end of the gas cylinder tube (36) is rigidly connected with the barrel.

The bolt (39) carries the extractor (40) which is held by the extractor spring (41). The firing pin (42) fits in the bolt, and has a cam lug which engages with a corresponding cam surface on the bolt lock (43). The downward motion of the bolt lock forces the firing pin back and prevents it from touching the cap of the cartridge until the arm is ready to fire. The bolt lock and link (44) are pivoted to the rear end of the bolt. The link connects the bolt lock and the slide (45), which moves horizontally in grooves in the receiver, the gas piston (46) being permanently attached to it. The slide is slotted to permit the magazine to pass through it, and has a notch on its lower rear end to engage with the sear (47). The link pin (48) passes through the link, hammer (49), and slide, pinning the three parts

<sup>2</sup> Magazines holding 20 cartridges are the standard size; they are also made to hold 30 and 40 cartridges. They are themselves filled by a device which presses in the cartridges; five at a time, from the usual clips.

together in such a manner that the link may swing on the pin as a pivot. The link pin also protrudes through a slot in the receiver to engage the operating handle. The recoil spring (55) is encased in the gas piston, its front end pushing forward on the piston while its rear end rests against the head of the recoil spring guide.

The sear (47) is pivoted in the sear carrier (51) by the sear pin which also holds the sear carrier to the trigger guard (52). The holes through which the sear pin passes in the trigger guard are slotted, allowing a slight horizontal movement of the sear carrier. When the sear engages in the notch of the moving slide, the counter recoil spring (53) acts as a buffer, allowing the sear carrier and sear to move instead of suddenly stopping the movement of the slide.

The ejector (54) is a flat spring which yields slightly when struck by the empty cartridge case so that the latter is gradually ejected.

**Action of the Mechanism.**—With the gun in the ready-to-feed position and the change lever set for semi-automatic fire the cycle of operation when the trigger is pulled is as follows:—The connector which is pivoted in the trigger moves the sear (47) out of engagement with the notch in the slide and is cammed forward allowing the sear to spring into position to engage the slide on its return. The recoil spring (55) which has been compressed during the recoil of the mechanism, drives the piston (46) and slide (45), carrying the bolt (39), bolt lock (43), link (44) and hammer (49) forward. As they move forward the lower edge of the bolt strikes the upper edge of the top cartridge in the magazine and drives it forward into the chamber.

As the parts are nearing their forward position, the rear of the bolt lock (43) which curves downward, comes in contact with the rounded end of the bolt-supports (23) and the rear end of the bolt lock is started moving upward. As the slide moves further forward, the top end of the link, which is pivoted to the bolt lock, tends to move upwards as the lower end is swung forward with the slide, and the link forces the rear end of the bolt lock in front of the recoil shoulder in the receiver, thus positively locking the breech, as shown in the illustration. The motion of the bolt as the bolt lock swings upward, is gradually stopped so that the bolt is not stopped suddenly, but very gently as its forward horizontal motion is transformed into the vertical motion of the rear of the bolt lock.

The hammer strikes the firing pin and the cartridge is ignited. The forward shoulders of the slide then strike the heavy buttment of the gas-cylinder tube, and the motion is arrested.

After the bullet passes the gas port in the barrel near its muzzle, the expanding gases enter the gas cylinder and drive the piston and slide rearward. The rear of the bolt lock is brought down away from the recoil shoulder of the receiver, and is started back, gradually starting the bolt rearward with it, but by the time the bolt starts to move, the pressure of the gases has subsided, so that the empty cartridge is no longer expanded against the walls of the chamber, but comes out freely. Extraction troubles are thus avoided. The bolt is both stopped and started gradually and is not damaged with hammer-like blows. The empty case is drawn from the chamber by the extractor until its upper edge strikes the ejector, when it is ejected to the right and forward; this avoids interference with a man immediately to the gunner's right.

The recoiling parts are arrested when the slide strikes the buffer, and the sear once more engages in the sear notch, which holds the slide and bolt mechanism to the rear with the breech open.

by an aluminum radiator with annular corrugations surrounding the barrel. The backward and forward motion of the barrel causes air to be driven into the holes in the radiator casing (of the Lewis gun, fig. 14) which also assists in the cooling. The locking of the bolt mechanism is positive and is done by two locking lugs on the bolt head which are rotated into locking recesses of the breech casing. Lugs are provided to guide the bolt head and bring it in contact with the cam cuts in the bolt body. The cartridges are fed from a semi-circular magazine holding 20 cartridges, when rim cartridges are used, and from a straight magazine when rimless cartridges are used. A regulator is provided, which adjusts the gun for safety, for automatic fire, or for semi-automatic fire.

The action of the mechanism is divided into two phases: the forward motion and the backward motion. The rifle is loaded by pulling the operating handle to the rear until the mechanism is arrested by the sear (57). A charged magazine is inserted into the magazine opening in the gun, the magazine being held in place by the magazine catch (58). When the trigger is pulled it causes the trigger bar (59) to rotate the hand sear (60) against the under side of the breech casing (61). This forces the sear lever (62) downward, depressing the sear and releasing it from the notch of the feed piece.

The bolt head (63), bolt body (64), firing pin, and feed piece move forward under the action of the mainspring, which is encased in the spring tube. The feed piece strikes the upper part of the head of the cartridge in the magazine and forces it forward out of the magazine. At this time the cartridge guide (65) is being held up by the roller working in the cartridge guide cam slot. The bullet is directed into the chamber, the magazine spring forcing the rear end of the cartridge up into the path of the bolt head just as the cartridge is freed from the lips of the magazine.

The cartridge guide cam causes the cartridge guide to drop, thus letting the feed piece pass forward and release the barrel catch (66).

The bolt-head stop (67) keeps the bolt head and bolt body at their extended positions so that the locking lugs in the bolt head are vertical, thereby permitting their entrance into the locking recesses. The bolt-head stop then comes out of the breech casing, the bolt head is released and rotates so that the locking lugs engage in the locking recesses in the breech casing to lock the mechanism. The bolt body and firing pin continue to move forward, and the extractor grips the rim of the cartridge as the bolt head turns. The firing pin primes the cartridge just as the feed piece releases the barrel catch.

**Backward motion:** The recoil from the explosion combined with the action of the gases on the barrel nut (68) carry the breech mechanism and casing in a locked position to the rear against the action of the recoil spring (69) and mainspring. The breech casing and barrel (70) being free to move, immediately start forward. The breech mechanism is held back, due to the sear engaging in the sear notch on the tail of the feed piece. As the barrel moves forward the empty cartridge case is drawn from the chamber by the extractor. As the barrel continues its forward motion the front end of the empty case clears the opening in the breech housing and it is thrown out through the ejection-opening by the pressure of the ejector upon its base. If the regulator is set for single fire the hand sear is immediately released by the trigger bar. This allows the sear to hold back the breech mechanism until the trigger is again pulled. If the regulator is set for automatic fire the hand sear is not released, but is held up

FIG. 11.—Chauchat Machine-rifle.

**Chauchat Machine-rifle.**—The Chauchat machine-rifle, model of 1915 (fig. 11), also known as Rifle C.S.R.G., was designed by a commission presided over by Col. Chauchat. It weighs about 19 lb. and is about 45 in. long. It takes the 8-mm. Lebel cartridge or, in the case of the guns taken over by the U.S. army,<sup>1</sup> the U.S. model of 1906 ammunition.

This rifle is recoil-operated; the recoil being assisted by deflecting part of the gases as they escape. The cooling of the barrel is assisted

<sup>1</sup> As already mentioned, the Browning gun was reserved until a large supply could be put into line at one time. Pending this, the American forces in France were equipped with the Chauchat of which some 34,000 were adapted to U.S. ammunition.

by the trigger mechanism. The rear cam surface on the bottom of the breech casing strikes and depresses the hand sear just as the barrel reaches its forward position. The hand sear forces the sear lever down, which in turn depresses the sear, releasing it from the sear notch of the feed piece. This allows the breech mechanism to go forward and repeat the cycle.

This rifle is provided with a forward grip (71) for use in marching fire. A bipod (72) is provided for prone or fixed position firing.

**Hotchkiss Light Machine-Rifle** (fig. 12) weighs 18½ lb., is air-cooled and gas-operated, magazine-fed, and provided with a bipod (73), a hand grip (74) and a shoulder stock. The general mechanism is the same as in the Hotchkiss machine-gun. The speed regulator and buffer mechanism is especially interesting.

The regulation of the speed of the gun is controlled by an escapement mechanism, located in the tube (75), which arrests the recoil mechanism and releases it after the catch has been set free of escapement.

This weapon, like the German light machine-guns described later, and unlike those hitherto dealt with, is derived directly from the heavy machine-gun. It is the outcome, therefore, of an effort to increase the mobility of the machine-gun rather than an attempt to improve the fire power of the shoulder rifle. As a true automatic rifle was available in the form of the Chauchat, and as all facilities for the manufacture of typical machine-gun elements were absorbed by the demand for heavy machine-guns, this type was not manufactured on a service scale during the war. It is however interesting as an instance of the machine-gun approximating to the machine-rifle.

FIG. 12.—Hotchkiss Machine-Rifle (French).

*Madsen Machine-Rifle* (fig. 13) is a recoil-operated, air-cooled rifle weighing about 16 pounds. It may be fired either semi-automatically or automatically. The rate of fire when used as an automatic is about 500 shots per minute. The barrel is about 23 in. long, somewhat larger in diameter than the barrel of the ordinary shoulder rifle, and is provided with annular rings and a perforated barrel casing to facilitate cooling. A bipod and a rest attached to the butt steady the rifle when used by a firer lying down. The cartridges are fed from a detachable quadrant-shaped, 40-round magazine projecting above the gun. A detachable barrel is provided for the purpose of gaining a more sustained fire, the system being to replace the barrel, when it has been excessively heated, by another barrel, and continue the fire while the first barrel is being cooled. It is claimed that the barrel may be changed in from 12 to 20 seconds.

FIG. 13.—Madsen Machine-Rifle (Russian).

The action of the mechanism is as follows:—

When the gun is loaded, as shown in the figure, and the trigger (76) is pulled, the hammer (77) under the force of the hammer spring (78) strikes the link (79), which transmits the blow to the firing pin and so to the cap. On firing, the barrel (80) and bolt mechanism (81), locked as a unit, recoils, compressing the recoil spring (82) until the link disconnects the bolt from the barrel lock and allows the bolt to recoil sufficiently to cock the hammer, extract and eject the fired cartridge case. The accelerator (83) assists in driving the bolt to the rear as it engages on the accelerator lug (84) during the recoil and transmits the momentum of the barrel and mechanism to the bolt. The accelerator also drives the barrel home during the forward stroke of the bolt.

A safety device (85) controls the trigger. A change lever (86) enables the gun to be fired semi-automatically or automatically.

The Madsen light machine-rifle was designed some years before the war, and for a time all Russian cavalry divisions had automatic rifle sections armed with it. These were abolished before the outbreak of the World War and replaced by ordinary machine-gun sections as the lighter weapon was found to be too delicate for the field. The Madsen was, however, again taken into use by the Russians during the war, and under the name of the "Musket" it formed the armament of the German "Musket battalions" which were created in 1915. Some of these units with their guns were engaged in the battle of the Somme 1916 but apparently the result, in the trying

conditions of the trench-warfare battle, was not very successful.<sup>1</sup> Tests have been made of the Madsen gun at different times in the British and United States armies.

The *Lewis Machine-Gun* (fig. 14) is a magazine-fed, gas-operated, and air-cooled machine-gun. The ground type, which is used as a light machine-gun, weighs 26½ lb., and is capable of firing at the rate of about 600 shots per minute. The ammunition is fed from a drum-type magazine placed over the receiver, and which holds 47 rounds for ground use, or 97 rounds for aircraft use. It was invented by Col. I. N. Lewis of the U.S. army shortly before the outbreak of the World War, and large numbers were purchased by the British Government to supplement the available Vickers (heavy) machine-guns. When the differentiation of light and heavy types began, therefore, the British army found itself already provided with a gun of what was judged to be sufficient mobility, handiness and firepower, and the Lewis gun became and remained the standard type of the light machine-gun for the fighting unit of infantry. In the United States, on the other hand, the military authorities determined to adopt the still lighter Browning, and pending the supply of this, the Chauchat as above mentioned. The Lewis gun, thus classed among the heavy machine-guns, was, however, used in large numbers for aircraft, and a few were employed for training purposes as well, some 39,000 of U.S. rifle calibre being ordered and produced. For aircraft, the gun was used by the French also, while in 1918 the Germans, who had a high opinion of it, armed some newly formed motor-cyclist units with captured weapons.

The principal feature is the cooling system, which consists of an aluminum radiator having deep longitudinal fins surrounded by a thin tubular casing which projects several inches beyond the barrel and is reduced in diameter at the front end. These parts with the barrel mouthpiece constitute the cooling system. The mouthpiece deflects the powder gases against the interior wall of the forward portion of the radiator casing in such a manner as to draw a current of cool air through the open rear end of the casing and along the thin fins from which it absorbs the heat. The heat conductivity and low specific gravity of aluminum combined with the construction described produce a light-weight cooling mechanism. The Lewis machine-gun is provided with a bipod mount. The over-all length is approximately 51 inches. The muzzle velocity and chamber pressure are approximately the same with a given ammunition as that of the shoulder rifles in which the ammunition is used.

Action: To operate the Lewis machine-gun, a loaded magazine (10-11) is placed in position on top of the gun, and the charging handle (8-4) is pulled to the rear until the scar nose (5-8) engages in the scar notch in the rack (8-1). The gun is then ready to be fired. When the trigger is pulled and held, the rack and piston (8-6) move forward under the action of the mainspring (9-9), which in unwinding rotates its gearwheel (9-7) and rack to carry the bolt (4-4) forward. As the operating rod moves forward, the front top edge of the bolt strikes the lower edge of the cartridge which is held in the magazine and feed-way, and drives the cartridge forward into the chamber. The locking lugs on the rear of the bolt move clear of the guide slots in the receiver so that the bolt is free to rotate. The locking of the bolt is then accomplished by the striker post coming in contact with the left side of a cam slot in the bolt, which forces the bolt and its lugs to turn one-eighth of a turn to the right. The extractor springs over the rim of the cartridge case (or the cannelure if rimless) as the bolt forces the cartridge in the chamber. The magazine is held by the rebound pawl (6-8) during the forward move of the bolt and piston. The feed operating arm (7-5) acted upon by the feed operating stud (4-1) on the rear of the bolt, returns to its normal position during the forward motion of the bolt ready to feed the next cartridge. When the bolt has been completely locked, the striker is free to drive forward and fire the cartridge. When the cartridge is fired the mechanism remains locked until immediately after the bullet has passed the gas port in the barrel (3-1). Thereupon a portion of the powder gases enters the gas regulator cup (3-8) and thence through a small aperture<sup>2</sup> reaches the front of the piston (8-6). The force of the expanding gases drives the piston to the rear and through the action of the rack, rewinds the mainspring (9-9). During the backward motion, the striker post, which is also carried on the rack, moves

<sup>1</sup> In 1918 the *Musketenbataillone* were reformed as ordinary heavy machine-gun units.

<sup>2</sup> The function of the gas regulator cup is to act as a well for any solid matter carried in the gas and to prevent fouling of the gas chamber. The size of the aperture can be adjusted as required.

operated by hand by means of a bolt handle (95); and an accelerator which is in the form of a cam lever, which acts against the bolt and barrel extension during the forward movement of the bolt, helping to push the barrel extension and barrel forward as the bolt advances under the action of the heavy recoil spring.

The gun is provided with a trigger and handgrip, a shoulder butt and a bipod, which is attached to the trunnion (96).

The front sight (97) is very high, owing to the low position of the barrel in the receiver and to the feed mechanism in cover. A tubular sight with a hole about one-fourth of an inch in diameter is attached by a bracket to the side of the gun for close-range shooting and for tank work. It will be noted that several features of this gun were adopted in the L.M.G. 08/18.

In the German army Bergmann guns formed the armament of the so-called "Light Machine Gun-Detachments," mounted units created in 1916 for the Rumanian campaign. The use of this gun, however, seems to have been discontinued towards the end of the war, the weapons remaining serviceable being handed over to Turkey.

FIG. 15.—Bergmann Light Machine-Gun.

**Machine Carbine-Pistols.**—The idea of securing more accurate shooting from a pistol by fitting it with a shoulder stock and lengthening the barrel is an old one, and one well-known modern example is the Mauser pistol (for description see 21.657-8). But while in the pistol proper, from the nature of the arm and its uses, all modern development has been in the direction of perfecting the semi-automatic action (see PISTOL), there arose in the World War a need for some weapon lighter and handier than the rifle yet capable of developing an intensely rapid fire at short ranges. The outcome of this need was a class of firearm which at present has few representatives and no recognized generic title, but is very interesting. In the absence of an accepted designation, these may be called machine carbine-pistols.

FIG. 16.—Bergmann Pistol-Gun.

In this field the precursors appear to have been the Italians. The *pistola mitragliatrice Fiat* (Fiat mitrailleuse pistol) was largely used by them as a substitute for the light machine-gun, no doubt because extreme lightness both in the gun and its ammunition was essential in an automatic arm for mountain warfare. The "machine pistol" is fitted with a small shield which also serves as a mounting, though the weapon can be used in the hands, if necessary. It is double-barrelled, each barrel having a separate box magazine of 25 rounds above the receiver. It is gas-operated and air-cooled. The bolt and its dependent parts are supported but not positively locked on firing. It weighs 14 lb. without shield, takes 9 mm. pistol ammunition, and is sighted to 500 metres. An outstanding feature is the very high rate of fire. Both magazines (50 rounds) are fired in two seconds, and with highly trained loaders and a full supply of magazines it is said that 1,000 rounds can be delivered in a minute. This extreme rate, in spite of certain advantages, militates against steadiness and accuracy, especially with so slight a mounting. Nevertheless, according to the Germans the weapon proved trustworthy and effective.

The *Bergmann Pistol-Gun* (fig 16), on the other hand, was intended not to replace the light machine-gun but to provide

artillerymen and machine-gunners with a handy personal weapon capable of intense fire power in emergencies. It originated in the pistol proper. The German service pistol 08 (Borchardt-Luger) used by specialists, who were not armed with the rifle, was fitted with a snail magazine (see PISTOL) allowing of 32 shots, the wooden holster being attached to the handgrip as a shoulder piece as in the Mauser pistol above alluded to, if accurate fire was required. The success of this arrangement led to the introduction of the Bergmann pistol-gun (officially, Machine-Pistol 18 I.), which in spite of its name is rather a carbine than a pistol, as an infantry weapon pure and simple.

This arm shoots 9 mm. pistol ammunition at the rate of about 540 shots per minute. The gun weighs 9 lb. 6 oz. without the magazine drum, which itself weighs 1 lb. 8 oz. empty. It is recoil-operated and air-cooled, and has an 8-in. barrel, protected by a casing perforated to allow circulation of air. The magazine (32 shots) is of the snail type (see PISTOL). The breech mechanism is of the "blow-back" class in which on firing the inertia of the bolt, the compressing of the mainspring, and friction of the cartridge in the chamber momentarily hold the action firm. The gun fires when the bolt reaches its forward position as the striker projects through the face of the bolt, and is cocked when the mainspring is compressed and the bolt drawn to the rear. This has the advantage that the chamber is always left empty, but the forward movement of the heavy bolt after pulling the trigger is liable to disturb the aim. The gun is sighted to 200 metres only.

This gun was only brought into use just before the Armistice.

FIG. 17. } Thompson Sub-Machine-Gun.  
FIG. 18. }

The *Thompson Sub-Machine-Gun* (figs. 17 and 18) is an interesting type of a very light portable automatic weapon which shoots a .45-calibre pistol cartridge. The action is semi-automatic or automatic at will. The rate of fire when used as an automatic is 800 to 1,500 shots per minute. The weapon is about 23 in. in length, weighs 7.5 lb., and uses a straight magazine (fig. 18) holding 20 cartridges in staggered rows, or drum magazines holding 50 or 100 cartridges (fig. 17).

The novel feature of this weapon is the angular wedge breech closure which utilizes the force of adhesion developed by the heavy breech pressure to lock the breech. The principle, developed by Comm. Blish of the U.S. navy, has been briefly stated as follows:—

"In any breech closure consisting of a breech plug in a suitable housing and having two pressure-resisting surfaces, the forward surface disposed normally to the axis of the bore, and the rear surface inclined thereto and bearing upon a suitable surface of the housing, the force of adhesion will under heavy pressure immovably fix the breech block, but at a comparatively small pressure (whose value depends upon the inclination of the two surfaces) the force of adhesion ceases to act and the breech block is rendered free to move under the influence of the forces then existing."

The principle permits the use of a very simple breech-locking mechanism, the essential element being a bolt (98) having an angular slot cut in the under side, into which the lock (99) is free to slide, and a housing or receiver (100) having a slot (101) into which a projecting lug on the lock engages when the bolt is in its firing position. Under high pressure the lock firmly adheres to the receiver shoulder and

prevents the bolt from being blown to the rear. When the pressure is reduced, the adhesion ceases, and the lock, actuated by the remaining pressure, automatically slides upward and clear of its retaining shoulder while the bolt moves rearward against the recoil spring (102) and cocks the firing pin.

When the weapon is cocked the entire bolt group is held by the sear (104) in a retracted position, as shown in fig. 17. On the trigger being pulled the bolt, driven forward by the recoil spring, pushes a cartridge into the chamber. During the forward motion of the bolt the hammer (103) strikes a shoulder of the receiver and rotates on the hammer pin, its top end strikes the firing pin and the cartridge is fired. Firing is discontinued by releasing the trigger; the sear (104) then engages the bolt in its retracted position, leaving the chamber empty. By means of the disconnector (105) the weapon can be made semi-automatic at will. When the magazine is emptied, the trip (106) allows the sear to engage the bolt in a rear position ready to feed and fire again when the trigger is pulled. Sights graduated to 600 yd. are provided.

The sub-machine-gun is intended as an auxiliary weapon for trench use and for close fighting generally. It has been adopted also by the police of several American cities for use as a riot weapon, both for shot and ball cartridges. (H. O'L.)

**RIGHI, AUGUSTO** (1850-1920), Italian physicist, was born at Bologna Aug. 27 1850. Details of his experimental work in magnetism and the problems of electricity and light are given in 17,389, 391 and 346, 6,859, 9,206, 21,936. He was specially noted for his discovery of the electrical conductivity of bismuth and other metals, and for his pioneer work in wireless telegraphy. G. Marconi was his pupil. He died at Bologna, June 8 1920.

**RILEY, JAMES WHITCOMB** (1853-1916), American poet (see 23,343), died at Indianapolis, Ind., July 22 1916. In 1915, by proclamation of the governor of Indiana, his birthday, Oct. 7, was observed throughout the state, in honour of "Indiana's most beloved citizen." In 1913 he issued in six volumes a biographical edition of his works.

See Clara E. Laughlin, *Reminiscences of J. W. Riley* (1916).

**RIO DE JANEIRO** (see 23,353).—According to the census of 1920, the pop. of the independent municipal commune, or federal district, which contains the city and is detached from the province of the same name, was 1,157,873 inhabitants. As the census of 1906 showed 811,443 inhabitants, the pop. has increased 43% in 14 years, an annual increment of 3.05 per cent. In 1920 there were 1,265 factories, large and small, with 46,953 operatives, representing a capital of nearly 270,000,000 paper milreis, and an annual production valued at about 500,000,000 milreis. In 1920 the number of buildings in the municipality was about 113,000, as against 84,375 in 1906. The federal district is governed by a prefect appointed by the president of the republic, and elects three senators and ten deputies to the national congress. The legislative power of the municipality is vested in a council consisting of 24 *intendentes* elected for three years.

The consolidated debt of the municipality in 1920 was computed at 227,089,200 paper milreis, of which 129,225,450 milreis was an external debt, and 97,863,750 milreis internal. The revenue had grown from 29,070,883 paper milreis in 1910 to 51,182,357 paper milreis in 1919.

**Education.**—Primary instruction is provided by the municipality, which in 1910 maintained 320 day-schools and 68 night-schools, with a matriculation of 74,111 pupils in the former and 8,662 in the latter. There are in addition 236 elementary private schools, with 19,825 pupils; over 80 receive a subvention from the Government on condition that they adopt the official curriculum and admit a certain number of children free. Secondary instruction is cared for in public lycées and in many private establishments. There is no university, but the capital possesses higher faculties of law, medicine and engineering, besides schools providing instruction in pharmacy, dentistry, commerce, music, dramatics and the fine arts. The national Government also maintains a naval academy, a military college and a preparatory school of tactics. The most important libraries are:—the National library, the best appointed in S. America; the Municipal; the Gabinete Portuguez da Leitura; that of the Lycée of Arts and Crafts; and the collections existing in the various ministries and departments.

**Streets and Buildings.**—During the decade 1910-20 the ambitious programme of municipal improvements inaugurated in 1903 was in large measure completed. The port works, including a sea-wall over 2 m. long, 8 ft. above mean high-tide, and lying almost entirely in deep-water, enclosing a broad reach of reclaimed land between it and the former shore-line, provide the city with the most modern facilities for loading and unloading ships. The Avenida Rio Branco

(formerly Avenida Central), built through the heart of the city in 1904, is now one of the handsomest thoroughfares in the western hemisphere. Over a mile long from N. to S., it is lined with fine private and public buildings. The military, naval and jockey clubs are situated there, and also the offices of some of the principal newspapers, such as the *Jornal do Comercio* and *O Paiz*, besides many fashionable shops, cafés and business places. At the southern end is a group of elegant State edifices, the Municipal theatre, the Monroe palace, and the National library and Academy of Fine Arts. It is adorned with three rows of trees, and with broad sidewalks of white and black stone set to form figures in mosaic, as in Lisbon. For this both material and workmen were imported from Portugal. The Municipal theatre, designed in 1904, cost over £2,000,000, although it seats but 1,700 people. The building which houses the National library, opened in 1910 in commemoration of the centenary of its founding (1808), is also a notable addition to the city. It is a fireproof structure of granite, marble and steel, equipped with every modern library appliance.

One of the important developments of Rio de Janeiro has been in suburban road-building. As the hills come practically to the bay and sea, construction is difficult, but great progress has been made and a 40-m. motor drive over perfect roads is now joining all the famous beaches with Tijuca and the city. The magnificent bay-side drive, the Avenida Beira-Mar, with its double motor track and intervening lawns and gardens, is particularly remarkable.

**Sanitation.**—The city, formerly a hotbed of yellow fever and smallpox, has become one of the healthiest tropical cities in the world. The death-rate has fallen to about 20 per 1,000. This is the result of a campaign of scrupulous cleanliness, rigid enforcement of sanitary measures and scientific eradication of mosquitos and other germ-bearing insects, inaugurated under the direction of the celebrated Brazilian scientist, Dr. Oswaldo Cruz, in the first administration of President Rodrigues Alves (1903). In 1920 a law was passed by Congress creating a national department of public health, consisting of three divisions, one in charge of the federal capital. (C. H. H.)

**RIO DE ORO** (see 23,357).—The area of the Spanish Sahara defined and extended by the Franco-Spanish Conventions of 1904 and 1912 is about 110,000 sq. miles. The frontiers have not been delimited. The colony proper (area, about 65,500 sq. m.) extends from lat. 21°20' N. to 26° N. The 1904 Agreement recognized a Spanish Protectorate over an area on the N. of about 34,700 sq. m., extending to lat. 27°40' N. and bounded E. by the meridian 8°40' W.; and the 1912 Agreement acknowledged the sovereign rights of Spain over this region. Still farther N. is an "occupied territory" of about 9,800 sq. m., extending to Wad Draa (lat. 28°45' N.), and forming an intermediate zone between the Spanish possessions and Morocco.

The interior has been little explored. A central volcanic tableland, the Tiris, about 1,000 ft. above sea-level, falls by terraces broken by ravines to the coastal plain and to the Segiet el Hamra on the north. To the S., the vast dunes of Azefal separate the Spanish Sahara from Mauretania (see 17,908). Wad Shebika enters the sea about 36 m. S.W. of Wad Draa and runs parallel to its lower course. The only permanent water is in brackish wells which frequently become choked. The only district likely to repay colonization appears to be the wide basin of the Segiet el Hamra and its tributaries, whose flood-waters suffice to fertilize pasture and arable land or date-groves, as at the oasis of Smara.

There are few main tracks and a network of smaller tracks, but no roads and but few villages. Smara, 160 km. inland from C. Juby, is the most important settlement and is the headquarters of the notorious religious agitators Ma el Ainin and his son El Hiba. Vil Cisneros, on the Dakhla peninsula, the residence of the governor (deputy for the governor-general of the Canaries), has a garrison and fish-curing industry; pop. (1918) 329 foreigners and 495 natives, with an adjoining village of 800 negroid half-castes (Imragen). The desert population, roughly estimated at 80,000, is nomadic, fluctuating between French and Spanish territory, and is split up into pro-French and pro-Spanish partisans. In 1912 there was a general rising under El Hiba. In 1916, a small Spanish expedition occupied C. Juby, but the fishermen, of whom the chief are the Aulad Delim Arabs and their allies the Regeibat (Arabized Berbers), remained practically uncontrolled. Camels and ostriches are reared.

In 1916 the total value of imports by sea was £4,820; of exports £4,910, chiefly fish and fish products. The fishing industry would be considerable if better methods were employed. There are open roadsteads at El Msit, at the mouth of the Segiet el Hamra, and Tarfaya, about 180 km. farther north. The climate is fairly equable on the coast, but intense heat and drought prevail inland, with diurnal variations of temperature in the shade of as much as 74°. At Villa Cisneros the mean maximum summer temperature is 86° F., and the mean minimum winter 48° F. (E. G. S.)

**RISLEY, SIR HERBERT HOPE** (1851-1911), English anthropologist, was born at Akeley, Bucks, Jan. 4 1851. Educated at

Winchester and New College, Oxford, he entered the Indian civil service in 1873 and he had a distinguished career; but his principal work was done in connexion with Indian ethnography, the discussion of the caste system, etc., and he published under Government auspices some important volumes of anthropometric data. He had charge of the Indian census operations of 1901. In 1910 he was appointed secretary of the judicial department of the India Office. He was made K.C.I.E. in 1907, and he died at Wimbledon Sept. 30 1911.

**RITCHIE, ANNE ISABELLA, LADY** (1837-1919), English writer (see 26.716), eldest daughter of W. M. Thackeray, died at Freshwater, I. of Wight, Feb. 26 1919. She is best remembered perhaps as the author of *Old Kensington* (1873). Amongst her other novels were *The Story of Elizabeth* (1863) and *The Village on the Cliff* (1865). She also published various volumes of biographical essays (*Madame de Sévigné*, 1881, and *A Book of Sibyls*, 1883, etc.), and contributed a most interesting series of prefaces to the Library edition of her father's works, thus supplying a substitute for the regular biography of him that he had always deprecated. Her husband, **SIR RICHMOND THACKERAY RITCHIE** (b. 1854), became permanent Under-Secretary of State for India in 1910, and died Oct. 12 1912.

**RIVIÈRE, BRITON** (1840-1920), English painter (see 23.387), died in London April 20 1920. His later works include "Aphrodite" (1902) and "Hark! Hark! the Lark" (1909), also a portrait of Lord Tennyson (1909). His eldest son, **HUGH GOLDWIN** (b. 1869), became a well-known painter; and the second son, **CLIVE** (b. 1872), a prominent physician.

**RIVINGTON, FRANCIS HANSARD** (1834-1913), British publisher (see 23.387), died July 2 1913.

**RIVOIRA, GIOVANNI TERESIO** (1849-1919), Italian archaeologist, was born at La Manta di Saluzzo in Piedmont Sept. 22 1849. He came of an old Piedmontese family and on his mother's side was descended from the Riccati (see 23.288), a family of mathematicians and architects. He took his training as an architect and engineer at the university of Turin, entered Rome with the Italian army in 1870 and thenceforth resided there, devoting his life to travel and to the study of the architecture of the later Roman Empire. In 1884 he married Edith E. Johnson of Cheltenham. He published two monumental works, *Le Origini dell' Architettura Lombarda* (1901-7, Eng. trans. 1910) and *Architettura Musulmana* (1914, Eng. trans. 1919). At the time of his death in Rome March 3 1919 he was engaged upon a third, *Architettura Romana*, which was posthumously published in Rome (1920) by his widow.

**ROBERT-FLEURY, TONY** (1837-1911), French painter (see 23.403), died in 1911.

**ROBERTS, FREDERICK SLEIGH ROBERTS, EARL** (1832-1914), British field-marshal (see 23.403). Subsequently to 1905 Lord Roberts took an active and leading part, as head of the National Service League, in the movement in favour of compulsory military service for home defence. On the outbreak of the World War he was a frequent and welcome visitor at the War Office, and shortly after the arrival of the two Indian divisions in France he crossed the Channel to visit them when the weather was cold and inclement. He was attacked by pneumonia while at the front, and he died at St. Omer on Nov. 14 1914, the title going by special remainder to his elder daughter, Aileen Mary. He was buried in St. Paul's.

Lord Roberts was a tried and brilliant commander in the field. His self-reliance and willingness to accept risks when planning operations were demonstrated by the daring advance to Kabul after the massacre of the Cavagnari Mission, and by his sloop across the Orange Free State from the Modder to Bloemfontein in Feb. 1900, abandoning his communications. That instinctive grasp of a tactical situation which stamps the great captain was displayed by him on many occasions, notably when he attacked the Afghans on the Peiwar Kotul and at Kandahar, and on the occasion of his riding on to the field of Paardeberg. His attractive personality and his natural kindness made him a most popular chief, and, even if he hardly ranked as a military administrator of the very foremost class, his steward-

ship in the high offices that he filled in India and at home was advantageous to the army and to the State. An eminently knightly figure, Lord Roberts was a fine horseman, a great gentleman, an ardent patriot and a devout Christian.

**ROBERTS, GEORGE HENRY** (1860- ), English Labour politician, was born at Chedgrave, Norfolk, July 27 1869. His parents removed to Norwich where he attended an elementary school and evening classes. In 1883 he was apprenticed to the trade of printer and compositor. At the expiration of apprenticeship he went to London and joined the London Society of Compositors. After a year he returned to Norwich and identified himself with the movement to organize local printers in a branch of the Typographical Association, of which he became president and ultimately secretary. He also became president of the Norwich and District Trades and Labour Council. He was elected to the Norwich School Board in 1899, being the first candidate run by the local Labour party to win a seat on a public body. In 1904 he was elected to the post of national organizer of the Typographical Association and was chosen as its parliamentary representative. He was returned as one of the members for Norwich at the general election of 1906, and has held the seat since. He was whip of the parliamentary Labour party for about eight years and a member of the executive council of the party. When the Labour party joined the Coalition movement in 1915 he became a Lord Commissioner of the Treasury; he was parliamentary secretary to the Board of Trade 1916-7; Minister of Labour, 1917-8; Food Controller, Jan. 1919. He resigned from the Government Feb. 1920.

**ROBERTS, JOHN** (1847-1919), English billiard-player, was born at Ardwick, Manchester, Aug. 15 1847, the son of John Roberts, also a great player of billiards. Details of the exploits both of father and son are given in 3.937. John Roberts, jun., died at Worthing Dec. 23 1919.

**ROBERTSON, SIR GEORGE SCOTT** (1852-1916), British soldier and administrator, was born in London Oct. 22 1852. He was educated at Westminster hospital medical school, and in 1878 entered the Indian medical service. He served through the Afghan War of 1879-80, and in 1888 was attached to the Indian Foreign Office, being employed as agency surgeon in Gilgit, on the frontier of Kashmir. In 1890-1 he travelled in Kafiristan (see 15.630). In 1893 he went as political agent to Chitral, and in 1895 was besieged there by hostile tribesmen (see 6.252). For his services he was created K.C.S.I., and appointed British agent in Gilgit. He retired from the Indian service in 1899 and returned to England. He unsuccessfully contested Stirlingshire in the Liberal interest in 1900, but was elected for Central Bradford in 1906. He died Jan. 1 1916.

**ROBERTSON, SIR WILLIAM ROBERT, BART.** (1850- ), British field-marshal, was born, of poor parentage, in Lincs. Sept. 14 1850. He enlisted as a private in the 16th Lancers in 1877 and served in the ranks of that regiment until 1888, when he won a commission in the 3rd Dragoon Guards, then in India. On joining he eagerly studied his profession in all its branches and he was very successful in learning the native languages. He was selected to be railway staff officer in the Miranzai and Black Mountain operations of 1891, and in the following year he joined the intelligence department at Simla; while on its staff he carried out a reconnaissance to the Pamirs, and in 1895 served with the Chitral Relief Force, being wounded and receiving the D.S.O. He passed through the Staff College in 1897-8—the first officer risen from the ranks to do so—and then, after a few months at the War Office, went out to S. Africa on the intelligence staff, he accompanied Lord Roberts on his advance from Cape Colony into the Transvaal and was promoted brevet lieutenant-colonel for his services. He spent the period from 1901 to 1907 at the War Office, being promoted colonel in 1903, and he then went to the staff at Aldershot, where he spent three years. In 1910 he was appointed commandant of the Staff College, was shortly afterwards promoted major-general, and in 1913 became director of military training at the War Office.

On mobilization of the army for the World War, Sir W. Robertson—he had been given the K.C.V.O. in 1913—was nominated

quartermaster-general of the Expeditionary Force; he filled that appointment most successfully for five months and then, in Jan. 1915, he became chief of the general staff to Sir J. French. In the autumn of that year he was promoted lieutenant-general for distinguished service and in the following Dec. was brought back to the War Office to take up the post of chief of the imperial general staff. There he immediately introduced great improvements in the office organization, and during the first year and a half of his holding the appointment he was successful in keeping the general control of operations on sound lines. While convinced that the western front represented the decisive theatre of war, and fully aware how mischievous was dispersion of force in principle, he saw to it that, where circumstances unfortunately rendered operations in distant regions unavoidable, the commanders on the spot were furnished with what was deemed essential to achieve success—with the result that the position of affairs in Mesopotamia, on the Suez frontier and in E. Africa was completely transformed within a very few months of his taking up his task. His services were recognized by his being promoted general in 1916 and by his being given the G.C.B. in 1917. He had, however, always experienced some trouble in sufficiently impressing upon the Government that the war could only be won in the west, and in the later months of 1917 he found it more and more difficult, in view of the somewhat disappointing results obtained by Allied offensives in France and Flanders, to persuade the War Cabinet that diversion of fighting resources to Alexandretta, or to Palestine, or to Macedonia, or to the Austro-Italian frontier, endangered prospects of victory at the decisive point and might lead to disaster near home. His anxieties were increased by the manner in which the problem of man-power was treated. He moreover foresaw that the plan of having a supreme war council composed of military representatives of the Allies, such as was introduced towards the end of the year, was an unworkable one. Finally in Feb. 1918 he resigned—just one month before the success that attended the great German offensive of March proved how correct had been his appreciation of the situation. He was given charge of the eastern command, and three months later he succeeded Lord French as commander-in-chief in Great Britain. On the final distribution of honours for the war he was rewarded with a baronetcy and grant of £10,000, and he was nominated G.C.M.G. From April 1919 to March 1920 he commanded the British troops on the Rhine, and, after relinquishing that appointment on the force being reduced, he was promoted field-marshal.

See his autobiographical volume *From Private to Field-marshal* (1921).

**ROBINS, ELIZABETH** (1865– ), Anglo-American novelist and actress, was born at Louisville, Ky., Aug. 6 1865, and educated at Zanesville, O. She had had her early training as an actress in America with the Boston Museum stock company, and afterwards with Edwin Booth. Coming to London she first appeared in *The Real Little Lord Fauntleroy* in 1889, and between 1890 and 1896 she played in most of Ibsen's plays, in which she established her position on the stage. In 1902 she was Lucrezia in Stephen Phillips's *Paolo and Francesca* at the St. James's theatre, London. Her first novels, *George Mandeville's Husband* (1894), *The New Moon* (1895) and *Below the Salt* (1896), appeared under the pseudonym of C. E. Raimond, but in 1898 the success of *The Open Question* led to her publishing in her own name, her reputation as a writer being maintained in *The Magnetic North* (1904); *A Dark Lantern* (1905); *Come and Find Me* (1908); *Camilla* (1918) and *The Messenger* (1920). She took an active part in the agitation for woman suffrage. Her play *Votes for Women* was acted at the Court theatre, London, in 1907.

**ROBINSON, EDWIN ARLINGTON** (1869– ), American poet, was born at Head Tide, Me., Dec. 22 1869. From the public schools of Gardiner, Me., he proceeded in 1891 to Harvard, but withdrew after two years to take a business position in New York City. From 1905 to 1910 he was connected with the N.Y. Customs House, and then returned to Gardiner to devote his time to literature, and especially to poetry. He became a member of the National Institute of Arts and Letters.

His works include *The Torrent and the Night After* (1896); *The Children of the Night* (1897); *Captain Craig* (1902); *The Town down the River* (1910); *Van Zorn* (1914, a play); *The Porcupine* (1915, a play); *The Man against the Sky* (1916); *Merlin* (1917); *Lancelot* (1920); *The Three Taverns* (1920); *Avon's Harvest* (1921); *Collected Poems* (1921).

**ROBSON, WILLIAM SNOWDON ROBSON, BARON** (1852–1918), English lawyer and lord of appeal, was born at Newcastle-upon-Tyne Sept. 10 1852. He was educated at Caius College, Cambridge, where he took his degree in 1877. In 1880 he was called to the bar and entered politics, sitting as Liberal member for Bow and Bromley from 1885 to 1886, and for South Shields from 1895 to 1910. He earned a reputation as a distinguished and energetic advocate, and became a Q.C. in 1892. In 1905 he was knighted, and became solicitor-general in Sir Henry Campbell-Bannerman's Government, being made Attorney-General in 1908. In 1910 he was made a privy councillor, and became a lord of appeal and life peer. He resigned his office in 1912, and died at Battle, Sussex, Sept. 11 1918.

**ROBY, HENRY JOHN** (1830–1915), English scholar (see 23.424), died at Grasmere Jan. 2 1915. He contributed a chapter on Roman law to the second volume of the *Cambridge Mediaeval History* in 1913.

**ROCHFORD, HENRI** (1830–1913), French politician (see 23.426), died at Aix-les-Bains June 30 1913.

**ROCKEFELLER, JOHN DAVISON** (1839– ), American capitalist (see 23.433), continued after 1910 to live a retired life, and to give great sums for charitable and educational purposes. In 1913 the Rockefeller Foundation was chartered under the laws of the state of New York (Congress having refused to enact the legislation necessary for a national charter) "to promote the well-being of mankind throughout the world." To this, the most extensive of his benefactions, Rockefeller had given in all \$180,000,000 by 1921. The income and \$10,000,000 of the original gifts were expended from time to time by its trustees. With increasing definiteness the Rockefeller Foundation focussed its efforts in the fields of medical education and public health. After 1913 it supported by appropriations the International Health Board, an independent organization engaged, in co-operation with governmental agencies, in demonstrations for the control of hookworm disease in 14 southern states of the United States and 22 foreign states or countries; of yellow fever in five South and Central American countries and of malaria in 10 southern states of the United States. In addition, the International Health Board, with funds provided by the Rockefeller Foundation, organized in 1917, partly as a war measure, the Commission for Prevention of Tuberculosis in France; this commission conducted in limited areas, as demonstrations, vigorous campaigns of popular education in hygiene, and provided for the training of French women as health visitors. By the end of 1920 arrangements were under way for the continuation of the work of the Commission by French authorities. In 1914 the Rockefeller Foundation established the China Medical Board to promote the development of scientific medicine and hygiene in China through medical schools, hospitals, and training schools for nurses. In 1919 the Peking Union Medical College, founded by it, was opened together with pre-medical and nurse-training schools. Gifts have been made also to other institutions in China offering pre-medical courses, and to hospitals. In 1920 the Foundation established a Division of Medical Education, through whose advice large pledges of money were made for the development of medical centres in London, and in various cities of Canada. As a part of its public health work, the Rockefeller Foundation also made grants for the support of schools of hygiene at Johns Hopkins University, Baltimore, and at the university of São Paulo, Brazil. A special feature of the work was provision for fellowships to persons from many different countries engaged in study in medical education and public health. During the year 1920, 71 fellows from 13 countries (including the United States) were supported. During the World War the Foundation contributed to war work agencies; and before crystallization of its general policy of limiting its work to

medical education and public health, it made appropriations to a number of objects in other fields.

To the General Education Board, the next largest of his charities, Rockefeller had given up to Dec. 1920 over \$115,000,000. By the close of the fiscal year 1920, this Board had contributed more than \$32,000,000 towards the endowments of different colleges, excluding professional departments, the general practice being to make gifts contingent upon the raising of additional sums. Among medical schools which received help were Washington University, \$2,345,000; Johns Hopkins, over \$2,200,000; University of Chicago, \$2,000,000 (joint fund with the Rockefeller Foundation, 1916); Vanderbilt, \$1,400,000 (1919); Rochester, \$5,000,000 (1920); Yale Medical School, \$1,582,000; and the McHarry Medical College (for negroes), Nashville, Tenn., \$150,000 (1920). The Board's facilities for aiding medical education were greatly increased in 1919 by a further gift from Rockefeller of \$20,000,000, both principal and interest to be expended in the United States during the next 50 years. In 1919 it gave \$500,000 towards the endowment of the Graduate School of Education at Harvard, opened the following year; and in 1920 appropriated \$1,000,000 to the proposed building fund of Teachers' College, Columbia University, the largest gift yet made to any institution for training teachers. To the Rockefeller Institute for Medical Research, New York, Rockefeller gave in all upwards of \$25,000,000. In Nov. 1920 announcement was made that he had given more than \$63,000,000 to the Laura Spelman Rockefeller Memorial, New York, largely for the continuing of charities in which Mrs. Rockefeller, who died in 1915, had been interested. By that time more than \$8,000,000 had already been appropriated, chiefly for the benefit of women and children.

It was estimated at the beginning of 1921 that the total amount given by Mr. Rockefeller for philanthropic and charitable purposes exceeded \$500,000,000. Nearly four-fifths of this had gone to the four great charitable corporations which he created: The Rockefeller Foundation, General Education Board, The Laura Spelman Rockefeller Memorial and the Rockefeller Institute for Medical Research. Quite as significant as the magnitude of these gifts was the fact that they were free from all restrictions, having been given for the general purposes of the respective corporations, the trustees of which have power to dispose of the principal as well as the income. As the corporate purposes of these organizations are extremely broad, and the gifts are free from restrictions, they will always be adaptable to the changing needs of the future generations. While it was probably true that Mr. Rockefeller was the richest man in the world, it would appear, in view of the statements made by competent authorities, that his wealth in 1921 was less than \$500,000,000, and that in making his gifts he had drawn very heavily upon capital as well as income.

**RODIN, FRANÇOIS AUGUSTE** (1840-1917), French sculptor (see 23.447), presented in Nov. 1914 20 examples of his work in bronze, including "L'Enfant prodigue," "La Muse," "France," "Cybèle," "L'ange déchu," "Balzac," and a bust of Mr. George Wyndham, to the Victoria and Albert museum, London, as a token of his admiration for the deeds of the British army. In 1916 Rodin presented all the works remaining in his possession to France, and in 1917 a replica of "The Burghers of Calais" was placed in the garden adjoining the House of Lords. He died at Meudon, near Paris, Nov. 17 1917.

**RODZIANKO, MICHAEL VASSILIEVICH** (1859- ), Russian politician, was born in 1859 and belonged to a family of great landowners. At the age of 19 he joined the Horse Guards, but he soon resigned and retired to his large estates in the government of Novgorod. He took an active part in local life and was also a member of the conferences of Zemstova and Towns. In 1905 he was elected member of the First Duma and was re-elected at all subsequent elections. He joined the right wing of the Octobrist (Moderate Liberal) party, and with the support of the Conservatives was elected president of the Third Duma after the resignation of A. Guchkov in March 1911. Later he was reelected president of the Fourth Duma, and took an important

part in the struggle for constitutional changes in the Government of Russia. He strongly opposed the reactionary policy of the Imperial Government, and always defended the rights and privileges of the Duma. By the force of events Rodzianko was placed at the head of the national movement at the moment of the revolution, and, as president of the Provisional Committee of the State Duma, he sent a telegram to the Tsar pointing out the necessity of his abdication. But he had no real influence on the course of the revolution. He played for some time a purely decorative rôle, receiving telegrams of congratulation and delivering speeches, but he soon disappeared from the stage. After the Bolshevik revolution, he made his way to the south of Russia, where he took part in different anti-Bolshevik organizations and bodies. Later he emigrated to Germany.

**ROGERS, BENJAMIN BICKLEY** (1828-1919), English classical scholar, was born at Shepton Montagu, Som., Dec. 11 1828. Educated at Wadham College, Oxford, he was elected a fellow of the college in 1852 and was called to the bar in 1856. There he was on the high road to success, when increasing deafness obliged him to retire and devote himself exclusively to literature. He translated all the plays of Aristophanes, reproducing the Greek metres in the English version. He died at Twickenham Sept. 22 1919.

**ROGERS, JAMES GUINNESS** (1822-1911), British Nonconformist divine, was born at Enniskillen, Ireland, Dec. 29 1822. He was educated at Silcoates school, Wakefield, and Trinity College, Dublin. From 1865 to 1900 he was a minister of the Clapham Congregational church. He is best remembered for his close association with Dr. Dail in the Liberal-Nonconformist education and disestablishment campaigns of 1865-75, and for his friendship with Mr. Gladstone and Lord Rosebery, who consulted him as the foremost representative of Nonconformist statesmanship. He died at Clapham Aug. 20 1911.

**ROLLAND, ROMAIN** (1866- ), French man of letters, was born at Clamecy, Nièvre, Jan. 29 1866. He was educated at Clamecy, and later in Paris, where he had a distinguished academic career. From 1889-91 he was a member of the French School in Rome, in 1892 went with an archaeological expedition to Italy, and in 1895 was appointed professor of the history of art at the École Normale Supérieure, later occupying the same position at the Sorbonne, where he introduced the study of the history of music. He produced many critical and historical works, among them *Histoire de l'Opéra en Europe avant Lulli et Scarlatti* (1895); *Des Causes de la Décadence de la Peinture italienne* (1895); and *Le Théâtre du Peuple* (1903); besides studies on Millet (1902); Beethoven (1903) and Michel-Ange (1906). His most famous work, however, is the romance of *Jean Christophe*, the biography of a German musician, one of the most remarkable productions of the present day. The work is in three series, *Jean Christophe*, *Jean Christophe à Paris* and *La Fin du Voyage*. It appeared in 10 volumes, the first, *L'Aube*, in 1904, and the last, *La Nouvelle Journée*, in 1912. A series of articles published by Romain Rolland in the *Journal de Genève* during Sept. and Oct. 1914 created an extremely bad impression in France owing to the "defeatist" attitude of the author. His later works include *Au-dessus de la Mêlée*, of which the ninth edition appeared in 1915; *Colas Brangnon*, a novel (1918); *Les Précurseurs* (1919) and *Voyage musical aux pays du passé* (1919).

See Jan Romein, *Romain Rolland* (1918); I. Debran, *M. R. Rolland, initiateur du défaitisme* (1918); W. Kuechler, *Romain Rolland* (1919).

**ROMER, SIR ROBERT** (1840-1918), English judge, was born in London Dec. 23 1840. He was educated privately and at Trinity Hall, Cambridge, where he was senior wrangler and Smith's prizeman in 1863. From 1865 to 1866 he was professor of mathematics at Queen's College, Cork, but in 1867 was called to the bar, becoming in 1881 a Q.C. and in 1884 a bencher of Lincoln's Inn. In 1890 he was raised to the bench of the Chancery division and knighted, and in 1899 became a lord justice of appeal. He presided over one of the inquiries made after the South African War, and was also a member of the royal commission on university education. He received the G.C.B. in 1901

and retired in 1906. Romer, who married in 1864 the daughter of Mark Lemon, editor of *Punch*, died at Bath March 19 1918.

**RONALD, SIR LONDON** (1873– ), English conductor and musical composer, born in London June 7 1873, was educated at St. Marylebone and All Souls grammar school, and the high school at Margate. His first appearance as a musician was in 1890, as solo pianist in the wordless musical play *L'Enfant Prodigue*, and in 1891 he was engaged by Sir Augustus Harris as conductor for a Covent Garden season. During the following years his reputation as a conductor steadily increased, and in 1908–9 he had a successful European tour. In 1908 he became conductor of the New Symphony Orchestra (now the Royal Albert Hall Orchestra), and in 1910 was appointed principal of the Guildhall school of music. His compositions include various orchestral works, and a large number of songs, many of which have attained wide popularity. He was knighted Jan. 1 1922.

**ROOSEVELT, FRANKLIN DELANO** (1882– ), American politician, was born in Hyde Park, N.Y., Jan. 30 1882. He was a distant cousin of Theodore Roosevelt. He was educated at Groton, Harvard (A.B. 1904), and the Columbia Law School (LL.B. 1907). He was admitted to the bar in 1907 and began practice in New York City. He began his public career in 1910 when he was elected to the New York State Senate, being the first Democrat in 28 years to represent his district. He was an anti-Tammany man and was associated with the group that successfully opposed the Tammany candidate for the U.S. Senate in the session of 1911–2. In 1912 he was reelected to the New York State Senate. The same year he strongly supported Woodrow Wilson for president and on the latter's election was appointed Assistant Secretary of the Navy in 1913. He then resigned from the New York Senate. In 1915 he was a member of the National Committee of the Panama-Pacific Exposition. After America's entrance into the World War he went to Europe in 1918 to attend conferences and to inspect the U.S. naval forces, and early in 1919 was in charge of their demobilization. He was a supporter of the League of Nations; he endorsed woman suffrage and was a strong advocate of civil-service reform for the post-office and civil consular appointments. At the Democratic National Convention in 1920 he was unanimously nominated for vice-president on the ticket with James M. Cox, but was defeated in the ensuing election.

**ROOSEVELT, THEODORE** (1858–1919), twenty-sixth President of the United States (see 23-707), completed his second term, March 4 1909, the most famous man in his country, with a wealth of personal friends, and a reputation as a master of men. Yet from the presidency, like most of his predecessors, he stepped down into a retirement which seemed to forbid a re-entry into public life or a recovery of the headship of his party. In the 10 remaining years of his life he displayed the same qualities of intense thought and action that had characterized him before; within a year after his withdrawal he again became a great force in American society and public life. A sense of fair play to his successor, President Taft, for whose choice he was indeed responsible, and that drawing-force of the unknown to which his nature was susceptible, led him to make plans for a hunting and exploring trip in Africa, some months before the end of his presidential term. He was also influenced by invitations to make addresses in England and France.

Accordingly he sailed from New York on March 23 1909 for Africa, where, in conjunction with his son Kermit and the well-known hunter Selous, he travelled a long distance, shot big game, and safely emerged at Khartum in March 1910. Here he plunged at once into politics by addresses at Khartum and Cairo, in which he stood for orderly and vigorous government for Egypt. In both instances the addresses were requested and approved by the local military authorities. From Egypt he proceeded to Europe, and, apparently to his own surprise, found himself an international celebrity. He was received in all the courts of central Europe except the Vatican, where an official interposed between him and the Pope by stipulating guarantees of his conduct in Rome. He left a most interesting account of the

impressions made upon him by this journey, in a long and intimate letter written at the time to the English historian Sir George Trevelyan, and published in Bishop's *Theodore Roosevelt and His Time*. It was in vain for him to claim that he was only a "private citizen with no claim to precedence"; for everywhere he was received with the honours ordinarily paid only to sovereigns. He was warmly received in France where he made a public address at the Sorbonne. In England his Romanes lecture at Oxford, and particularly his Guildhall speech on the management of a great empire, were noteworthy; and he was designated by President Taft to represent the United States at the State funeral of Edward VII. His most striking experience was in Germany, where he was received with cordiality by the Emperor, but, as he said afterwards, it was the only country in Europe where he felt that "every man, woman and child was my natural enemy—that is, the enemy of my country."

Returning to the United States, June 18 1910, Roosevelt found that both his African and European experiences had been followed closely by the American people. President Taft had now had a year and a half of experience with the country, with Congress, and with reforms and policies which Roosevelt had initiated and expected would be carried out. There was a rift in the Republican party. Some of Roosevelt's friends were in opposition to the Taft administration. In the Ballinger controversy over western public lands, Roosevelt sided against the administration. A group of dissatisfied Republicans, the "insurgents," had arisen in Congress, and prepared to dispute the supremacy of the Conservatives in the party, on whom Taft seemed to be relying. To Roosevelt's mind, the "moss-backs" were in control; and a few hours after landing he agreed to throw his personal influence on behalf of Governor Hughes of New York, who was engaged in a struggle with the Republican Legislature over the direct primary. He made an address at Ossawatimie, Kan., Aug. 31, in which he laid down a radical programme of political and social reform to which he gave the name of the "New Nationalism." Plainly he was dissatisfied with Taft's administration. As early as Nov. 21 he discussed with an intimate friend the possibility of his accepting the nomination in 1912, to succeed Taft in the presidency. Through 1911 this quarrel grew. Soon after returning, Roosevelt became an editorial writer, bearing a free lance, in *The Outlook*, and alike in his editorials and in public addresses he took the side of the insurgent element. He regarded Taft as the representative of "the interests." Early in 1912, a group of seven Republican governors united in an appeal to Roosevelt to declare his willingness to be nominated. On Feb. 12, Taft made a bitter speech, in which, without mentioning Roosevelt, he spoke contemptuously of the extremists. This seems to have been the incident that decided Roosevelt's course; for on Feb. 26 he came out openly as a candidate for the nomination by the party convention in June.

Meanwhile the usual campaign for the choice of delegates to the Convention was going on, following the same lines as in 1908. In the southern states, where the Republicans were hopelessly in the minority, delegates were elected by the usual rump and machine-led state conventions. Roosevelt's friends made a campaign in the northern and western states, especially in those which had provided for a choice of delegates through a popular vote in party primaries. A majority of the Republican voters in those states favoured Roosevelt. When the Republican Convention met in Chicago, June 22, Taft was strong in the delegations chosen by state and local conventions; and Roosevelt in those representing a predominance of Republican voters. The organization of the Convention, however, was in the hands of the Taft men, because they had a large majority in the National Committee. Out of the numerous contested seats, only six were finally assigned by the Committee of Credentials to the Roosevelt column. On a test vote for the choice of temporary chairman, the Taft men showed a narrow margin. The turn of 15 votes—which might have been secured had Roosevelt come out a few weeks earlier—would probably have brought

on a "landslide" for him. A speech by Roosevelt a few weeks earlier before the Ohio Constitutional Convention, advocating the "Recall" of judicial decisions, also gave alarm to some men who might otherwise have supported him. Once organized, the Taft forces were able to carry through the report of the Committee on Credentials, which assigned them a safe majority.

Roosevelt himself had come to Chicago a few days before the Convention, and was the centre of the hardest battle of his life. He rallied his supporters, and addressed an enormous public meeting, ending his speech with "We stand at Armageddon, and we battle for the Lord." Most of his followers stood by him; but they could not break down the walls of precedent and conservatism. The Roosevelt delegates, on their leader's request, remained in the Convention until the end, but refused to vote on the nomination; and Taft was duly nominated for a second term by the vote of about two-thirds of the Convention.

Roosevelt was a party man, who had stood by the party in 1884 when many of his friends bolted. His standpoint in 1912 was that he was trying to save the Republican party from a ruinous yielding to the forces of organized wealth and reaction. He was also a fighter, and felt himself deprived, by technicalities and personal hatreds, of an honour which the majority of his party was eager to bestow upon him. He unhesitatingly decided to "bolt," and on the evening of the adjournment of the Convention, at a meeting in Orchestra Hall, he advised the formation of a Progressive party. A later Convention of the Roosevelt men throughout the country, including a considerable number of Democrats, nominated Roosevelt, with Gov. Hiram W. Johnson of California for vice-president. Meanwhile the Democrats had nominated Woodrow Wilson, governor of New Jersey. The result was a three-cornered political contest, in which it was clear at the beginning that Taft could not be elected, but that Roosevelt probably could not win enough Democratic votes to prevent the choice of Wilson. Nevertheless, Roosevelt fought vigorously through the campaign, violently attacking Taft as a reactionary and tool of reactionaries. While on a speaking tour at Milwaukee he was shot by a fanatic, but was not seriously injured.

The result of the election was the choice of Wilson, who had 6,000,000 popular votes and 435 electoral votes; Roosevelt, 4,000,000 popular votes, and 88 electoral; Taft, 3,500,000 popular votes, and 8 electoral. On this showing the Progressives had more votes than their Republican adversaries, and therefore hoped to compel a reconstruction of the party. Their Republican opponents, however, kept tight hold of the name, organization and prestige. They had deliberately accepted defeat in advance in order to put Roosevelt out of the running.

This, the first serious defeat that Roosevelt had ever encountered, was to him a bitter humiliation. He felt that his public career was ended. His first movement was characteristic. He had cordial invitations to visit S. America and make addresses in the principal cities. As in his experiences of 1910, this dovetailed in with a plan of exploration. Accordingly, early in 1913, after visiting several S. American countries, including Brazil and Argentina, he returned to Brazil, made his way overland, and came down a river, whose uncharted course he followed for 600 miles. The hardships were severe, and he received an injury, serious for a time, and drew into his system the seeds of tropical malaria. The Brazilian Government named the stream Rio Teodoro.

On his return to the United States, out of office, a defeated candidate, an insurgent, the personal enemy of the Republican leaders, he seemed justified in his belief that his career was over. But as usual his enemies played into his hands. An obscure journalist ventured publicly to accuse him of drunkenness. In May 1913 he instituted a suit for defamation of character, with the result that the defendant broke down and acknowledged his error. A large section of the American people resented the affront, and rejoiced in the vindication. During this period Roosevelt was indefatigable as journalist and writer, first in *The Outlook*, then in the *Metropolitan* magazine, and finally through the columns of the *Kansas City Star*.

The outbreak of the World War gave him a new opportunity for his pen and voice. His instinct was against Germany as an oppressor of weak nations; but he stayed his desire for positive action for a time, from the feeling that he ought not to embarrass the President. It was at this time that a personal enemy gave Roosevelt the opportunity of again showing his character to his countrymen, through a publicity which both Roosevelt and the public enjoyed. William Barnes, one of the acknowledged leaders of the Republican party, brought a suit in April 1915 against Roosevelt because of an accusation of unfair and corrupt politics as a "boss" which Roosevelt had made against him. Roosevelt vigorously defended himself and won the suit. For 10 days he was on the witness-stand, and his testimony, which was spread broadcast throughout the land, revealed his undiminished force and appealed to the popular imagination.

The sinking of the "Lusitania" by a German submarine in May 1915 brought his bitterest denunciation, and from that time he foresaw first the possibility and then the likelihood of war between Germany and the United States. He made himself the leading spokesman for "preparedness," and presently drew down the wrath of President Wilson's administration for a speech at Plattsburg. From that time he did not spare sharp criticisms of President Wilson's policy as showing unwillingness to face the dangers of war. His utterances against Germany and in favour of the Allies had great influence.

As the election of 1916 drew near, the remaining Progressives, aided by some who had stayed in the Republican party, made an effort to force the Republican Convention to nominate Roosevelt. They called a Progressive Convention to meet at Chicago at the same time as the Republican, hoping to make a joint nomination with the Republicans. Roosevelt did his best to secure the prize, but again the party leaders would have none of him. Hughes was nominated, and this time Roosevelt accepted the situation as a loyal member of the Republican party, and supported the nominee.

As the World War went on, Roosevelt became the severest critic of the administration and the strongest advocate of preparedness. He formed a plan for raising a special division, in which he hoped to have a command, and which he would offer to the Government. Early in 1917, when the American breach with Germany came, he offered the services of himself and his sons, all four of whom subsequently enlisted. He requested that he might have a personal command, which was denied by the administration, although both Houses of Congress united in a bill making his plan possible. During the year he made some of the most notable addresses of his life, especially that before the "Order of Moose" Convention in Pittsburgh. By this time the Republican politicians were looking forward to the election of 1920 and began to group themselves about Roosevelt. His most persistent enemies, even William Barnes, accepted his nomination as a foregone conclusion. The year 1918, however, was a sad one for Roosevelt. His son Quentin was killed in the war. Ever since returning from Brazil, Roosevelt's constitution had shown weakness. He was several times in hospitals, and underwent a serious operation for abscess due to infection received during his Brazilian explorations. The hearing of his left ear was wholly destroyed. Still he continued his writing and speaking, and his direct personal influence upon his thousands of friends. Even in the first days of 1919, when he suffered from renewed disease, he looked forward to public service. On Jan. 6 1919 he died in his sleep.

A man who could do so much could not do everything perfectly, though few have ever done so many things so well. It was more true of him than of most men that his defects were inherent in his virtues. There were few half-tones in Roosevelt's moral perceptions and fewer in his vocabulary; he saw things as either black or white, and he forgot sometimes that he had not previously seen them as he saw them at the moment. He had enemies, and even former friends, who charged him with breaking promises, betraying political associates and setting his own wishes and interests above all others. The very intensity of his convictions sometimes blinded him to the sincer-

ity and even to the justice of other points of view. Nevertheless this intensity, this moral fervour, gave his ideas a momentum and a success which they could never have acquired had they proceeded from a more judicial mind. He scorned "weasel words," and on occasion he did not hesitate to describe his enemies as thieves and liars. His remarkable energy reminded observers of some great elemental force which, like any natural phenomenon, is controlled by its own necessary laws. When Lord Morley was leaving the United States in 1904 he was asked by reporters what in America had impressed him most. "Two things," he replied, "Theodore Roosevelt and Niagara Rapids."

His fearlessness was as conspicuous as his energy. With a courage very rare in political life he attacked the iniquities that had crept into the conduct of American business. He asserted the importance of personal rights when these were being openly denied in the name of property rights. He rallied the patriotic elements of the country against the menace of a private "money power" which not only had frequently dictated the course of legislation but threatened to usurp the authority of the Government itself. He felt strongly that any position involving the exercise of power had its obligations as well as its privileges, and this feeling lent force to his denunciation of "predatory interests" and "malefactors of great wealth." On the other hand he had little patience with demagogic attacks on men or corporations merely because they were rich or successful, as was shown in his famous utterance in which he compared the authors of these journalistic attacks with the "muckrakers" in *Pilgrim's Progress*. It was said of him satirically that he had invented the Ten Commandments; but Roosevelt's earnestness in behalf of old truths was of the essence of his service to his countrymen, and more important at the juncture than the discovery of new ones.

His great personal power was used in the furtherance of honesty, fair dealing and patriotic service, when more than lip service to these virtues was vitally needed. He threw all his energy into the effort to bring about a reapplication of fundamental moral principles to American business and political life. While he was unquestionably an astute politician, the secret of his success lay in his imaginative understanding of the views and feelings of his countrymen: his enthusiasm was contagious because he vividly expressed what they already felt and believed to be the truest American ideals. When he spoke for the "square deal," the American people as a people always responded.

Born of a wealthy family, in an aristocratic society, enjoying all his days a literary and artistic atmosphere, he was still a natural democrat. He had a personal interest in every man or woman that he met, and a genuine affection literally for thousands of individual persons. He was a scientific man whose observations and deductions were valued by naturalists and investigators. He was a literary man, very widely read. He was an intellectual man, interested from youth to age in literature and philosophy. He was a politician without a rival in his time for boldness, foresight, and an innate knowledge of what his fellow countrymen were thinking about. He was a statesman of the most brilliant ability, who after a crushing defeat returned to power over the minds of the people and was on his way again to the presidency of the United States. His bitterest political enemies accepted his coming back to national leadership. To few men in history has it been given to wield such far-spreading and wholesome personal influence.

**BIBLIOGRAPHY.**—Between 1909 and 1919 Roosevelt published about 15 books, several of them consisting of articles and addresses. The more important are *African Game Trails* (1910); *Conservation of Womankind and Children* (1912); *Theodore Roosevelt, an Autobiography* (1913, contains little beyond 1909); *Life-Histories of African Game Animals* (2 vols. 1914); *A Hunter-Naturalist in the Brazilian Wilderness* (1914); *Through the Brazilian Wilderness* (1914); *A Book-lover's Holiday in the Open* (1916). His principal later books on public affairs and on the World War are *Realizable Ideals* (1912); *America and the World War* (1915 and 1919); *Fear God and Take Your Own Part* (1916); *National Strength and International Duty* (1917); *The Great Adventure* (1918). Numerous collections of extracts and speeches have been published, especially those of W. F. Johnson (1909); L. F. Abbott (*African and European*, 1910); W. Griffith (1919); J. B. Bishop, *Letters to his Children* (1919).

The most important biographies are those by J. B. Bishop (1920); H. Hagedorn, *Boy's Life of Theodore Roosevelt* (1919); W. D. Lewis (1919); W. R. Thayer (1919); Bradley Gilman (1921) and H. Hagedorn's *Roosevelt in the Bad Lands* (1921). A useful list of books by and about Roosevelt is J. H. Whellock's, *Bibliography of Theodore Roosevelt* (1920). (A. B. H.)

**ROOT, ELIHU** (1845– ), American lawyer and political leader (see 23.711), was elected president of the N.Y. State Bar Association in 1910, and chairman of the board of trustees of the Carnegie Institution of Washington in 1913. He was chairman of the N.Y. State Republican Convention in 1912, 1913, 1914, 1916, and permanent chairman of the Republican National Convention in 1912. In 1913 he favoured the repeal of the bill exempting American shipping from Panama Canal tolls. He also approved President Wilson's policy of non-interference in Mexico. He assailed as class legislation the exemption of labour unions and agricultural associations from the Sherman Anti-Trust Act. On Dec. 10 1910 he was awarded the Nobel peace prize because of his work in the pacification of the Philippines and Cuba as well as his part in the negotiations between the United States and Japan. The same day he became a member of the Court of Arbitration for settling the claims of British, French and Spanish subjects in connexion with property seized by the Portuguese Government when a republic had been proclaimed. In 1915 he opposed Secretary Bryan's treaty with Colombia, disapproving any apology for incidents attending the acquisition of the Canal Zone and regarding the proposed payment of \$25,000,000 as too large. He attacked the Ship Purchase bill, pointing out dangers of international difficulties in case interned vessels were taken over. He also argued that for the Government to acquire shipping would discourage private enterprise and was socialistic in tendency. He was president of the State Constitutional Convention in 1915 and worked for many reforms, including the short ballot, means for remedying the law's delays and the excessive cost of securing justice, and the making of impeachments easier. When submitted to the voters, however, the new constitution was defeated. He was unanimously elected president of the American Bar Association in 1915. The same year he retired from the U.S. Senate, having refused to stand for a reelection.

He had long advocated preparedness on the part of the United States and early in 1917 spoke in favour of war against Germany. After the United States entered the World War he urged full support of the President. In May 1917 he was appointed chairman of the special American mission sent to Russia and was given the rank of ambassador. Arriving at Petrograd in June he addressed the Russian Council of Ministers and in Moscow spoke at a special session of the Duma and at a meeting of the local Council of Workmen's and Soldiers' Delegates. Later he visited General Brussilov at staff headquarters. On his return to America he was elected honorary president of the National Security League, succeeding Joseph H. Choate. On Sept. 25 1917 he presided at the meeting of the National Association Opposed to Woman Suffrage and denounced suffrage agitation during the critical period of the war. He had never supported the movement and in 1914 had been blacklisted by the National American Suffrage Association. He approved in general the Covenant of the League of Nations but in 1919 suggested six amendments to protect American interests, including reservations concerning the Monroe Doctrine and immigration. He favoured separate consideration of the Peace Treaty and the League. He was strongly opposed to the Prohibition amendment to the Federal Constitution; was retained as counsel by several brewing interests and in 1920 argued before the U.S. Supreme Court against its constitutionality, but unsuccessfully. In 1920 the President reappointed him U.S. delegate to the Hague Tribunal and he went to Holland to assist in organizing the Permanent Court. In July 1920 he spoke at the unveiling of St. Gaudens' statue of Lincoln in London. In 1921 he was one of the four U.S. delegates at the Washington Conference on the Limitation of Armament.

He was the author of several volumes of lectures and addresses, including *Experiments in Government and the Essentials of the Con-*

*stitution* (1913, lectures delivered at Princeton); *Addresses on International Subjects* (1916); *Addresses on Government and Citizenship* (1916); *The Military and Colonial Policy of the United States* (1916); *Latin America and the United States* (1917); *Miscellaneous Addresses* (1917); *North Atlantic Coast Fisheries at The Hague* (1917) and *The United States and the War* (1918).

**ROSCOE, SIR HENRY ENFIELD** (1833-1915), English chemist (see 23.725), died at Leatherhead, Surrey, Dec. 18 1915.

**ROSEBERY, ARCHIBALD PHILIP PRIMROSE, 5TH EARL OF** (1847- ), British statesman (see 23.731), took an active part in the constitutional crisis in 1910 and 1911. He treated the Parliament bill as a revolutionary measure which in effect constituted single-chamber Government, and did his utmost to arouse the nation to a sense of its danger. But he disapproved of the bill which Lord Lansdowne introduced in May 1911 for the reconstitution of the House of Lords, holding that the Opposition ought to have contented themselves with reaffirming his own resolutions of the previous year. If the Parliament bill became law, Lord Lansdowne's bill mattered little; who would then be the acolytes and sycophants who would accept the degrading position of members of a second chamber? While, however, he bitterly condemned the conduct of ministers in going to "a young and inexperienced King" for contingent guarantees, he declined to follow the extreme course of rejecting the bill recommended by the "Die-hards." He shrank from the scandal of a great creation of peers. If the bill were allowed to pass, the House would be left with some vitality; if the creation of peers was forced, they would have none at all. He showed his own estimate of the impotence of the House after the passage of the bill by ceasing to attend its debates; and indeed he took no further part in public life till the outbreak of war in 1914 fired his patriotism. As lord-lieutenant of Midlothian and Linlithgowshire he promoted recruiting and other warlike activities in his own country; and helped to hearten the nation and to avert a premature peace by occasional speeches. His feeling was shown by a preface which he wrote in Oct. 1914 for the first volume of Col. John Buchan's *History of the War*. He spoke of "the incalculable blessing which the damnable invasion of Belgium has conferred incidentally upon ourselves. . . . It has revealed to the world the enthusiastic and weather-proof unity of the Empire. . . . Blood shed in common is the cement of nations, and we and our sons may look to see a beneficence of empire, not such as the Prussians dreamed of, not a war-lordship over other nations, not a nightmare of oppression, but a world-wide British influence which shall be a guarantee of liberty and peace, and which, hand-in-hand with our Allies in Europe and with our kindred in the United States, should go far to make such another war as this impossible."

The war cost Lord Rosebery his younger son, the Right Hon. NEIL PRIMROSE (1882-1917), whose political advance had been watched by his father with eager sympathy. He was under-secretary for the Foreign Office in 1915, parliamentary secretary for Munitions in 1916, and at the close of that year became Coalition Liberal Whip under Mr. Lloyd George. But these appointments were only held for short periods in the intervals of fighting as a captain in the Buckinghamshire Hussars, and he died of wounds received in action in Palestine in Nov. 1917. He had married Lord Derby's daughter in 1915. Lord Rosebery had a further domestic sorrow in the dissolution, in 1919, of the marriage (celebrated in 1909) of his elder son Lord Dalmeny with Dorothy A. M. A. Grosvenor. Lord Rosebery was created Earl of Midlothian in the peerage of the United Kingdom—the earldom of Rosebery being a Scottish earldom—at the coronation of King George in 1911, at which ceremony, as at the coronation of King Edward, he was one of the lords who bore the canopy. He became chancellor of Glasgow University in 1908 as he had long been chancellor of London University; and was chosen lord rector of St. Andrews University for the year of its quincentenary celebration in 1911.

**ROSEGGGER, PETER** (1843-1918), Austrian poet and novelist (see 23.734), died in 1918. (See AUSTRIAN EMPIRE: Literature.)

**ROSENTHAL, TOBY EDWARD** (1848-1917), American painter (see 23.735), died in Berlin, Germany, Dec. 28 1917.

**ROSENWALD, JULIUS** (1862- ), American merchant and philanthropist, was born at Springfield, Ill., Aug. 12 1862, and was educated in the public schools. From 1885 to 1906 he was president of Rosenwald & Weil, clothing manufacturers, Chicago. In 1895 he became vice-president and treasurer of the mail-order house of Sears, Roebuck & Co., Chicago, and in 1910 president. The gross sales of the company, which were \$1,750,000 in 1896, increased under his management to \$258,000,000 in 1919. He served during the World War under appointment by President Wilson as a member of the Advisory Commission of the Council of National Defense. In 1918 he was sent on a special mission of cheer by Secretary Baker, of the War Department, to the American troops in France. In 1919-20 he served in Washington as a member of the President's Industrial Conference. He devoted much time to work for philanthropic, educational and civic organizations. He gave \$150,000 to Tuskegee (Ala.) Normal and Industrial Institute; \$250,000 for a building to house Jewish philanthropic organizations of Chicago; and (with Mrs. Rosenwald) \$750,000 for new buildings for the university of Chicago. Of the latter sum \$250,000 was used to erect a building, Julius Rosenwald Hall, for the departments of geology and geography, and \$500,000 for buildings for the medical department. He founded dental infirmaries in the Chicago public schools. During the World War he gave large sums to relief organizations, in 1917 alone \$1,000,000 to aid sufferers in eastern Europe. He contributed generously to, and took a leading part in securing contributions for, the Hoover Children's Relief Fund in 1920-1. Beginning in 1914, he stimulated a programme for building rural schools for negroes in the southern states by agreeing to contribute toward their cost and toward the lengthening of the school terms, provided both the whites and the negroes of the neighbourhood contributed also and that public funds were appropriated. Up to 1920, 800 schools were thus constructed at a total cost of \$1,500,000, of which Mr. Rosenwald gave \$400,000. In 1920, 500 additional buildings were authorized for immediate construction at an approximate cost of \$2,000,000, of which Mr. Rosenwald agreed to pay \$500,000. At the close of 1920, 14 cities had Y.M.C.A. buildings for negroes, costing altogether \$2,000,000, because of Mr. Rosenwald's offer to contribute \$25,000 to each city under certain conditions. His share in the cost was \$350,000. He was an official of several leading philanthropic, civic and educational organizations of Chicago, including the university of Chicago; also of the Rockefeller Foundation, Tuskegee Normal and Industrial Institute, the Baron de Hirsch Fund and the American Jewish Committee, and was identified with many other movements for public benefit throughout the country.

On Dec. 29 1921 it was announced that Mr. Rosenwald had pledged about \$20,000,000 to safeguard the interests of Sears, Roebuck & Co. during the critical period of business readjustment after the World War. He increased the company's fluid assets by purchasing for \$16,000,000 part of the real estate owned by the company in Chicago, and gave the company from his own holdings 50,000 shares of its common stock (par value \$100). In 1920 and 1921 the company had paid no dividends on its common stock and it was apparent that its accounts at the end of 1921 must show a deficit. But Mr. Rosenwald by this action enabled the company to readjust its finances without impairing its capital stock, and protected its stockholders, many of them employees. It was recognized generally that he established a precedent which raised the standards of business when he thus faced heavy loss in order to protect those who had bought shares because of their confidence in his leadership, and also in order to foster the practice of employees' participative investment.

**ROSS, SIR GEORGE WILLIAM** (1841-1914), Canadian politician (see 23.739), was knighted in 1910. He published, amongst other works, *The Life and Times of the Hon. Alex. Mackenzie* and *Getting into Parliament and After*. He died March 8 1914.

**ROSS, ROBERT BALDWIN** (1869-1918), British art critic and writer, was born at Tours May 25 1869, the son of the

Hon. John Ross, Q.C., attorney-general for Upper Canada, his mother being a daughter of the Hon. Robert Baldwin, premier of Upper Canada. He was educated privately, and later at King's College, Cambridge. After leaving the university he took to journalism. As a judge of pictures he was in very high repute, and from 1912 to 1914 he acted as adviser to the Board of Inland Revenue on picture valuations for estate duty. The most noteworthy feature of many years of his life, however, was his friendship with Oscar Wilde, whose literary executor he ultimately became. He was responsible for the publication of Wilde's *De Profundis* (1905), and subsequently for a complete edition of Wilde's works. Not long before his death Ross received from his admirers a presentation of plate, and also a sum of money which, at his request, was applied to the foundation of a scholarship at the Slade school of art. He died in London Oct. 5 1918.

**ROSS, SIR RONALD** (1857– ), British physician and bacteriologist, was born at Almora, India, May 13 1857. He studied medicine at St. Bartholomew's hospital, and in 1881 entered the Indian medical service. About 1893 he commenced a series of special investigations on the subject of malaria, and by 1895 had arrived at his theory that the micro-organisms of this disease are spread by mosquitos (see 17.463, 20.786). In 1899 he retired from the Indian medical service, and devoted himself to research and teaching, joining the Liverpool school of tropical medicine as lecturer, and subsequently becoming professor of tropical medicine at Liverpool University. In 1913 he became physician for tropical diseases to King's College, London. During the World War Ross was appointed to the R.A.M.C. and became War Office consultant in malaria. In 1902 he received the Nobel prize for medicine, in 1911 a K.C.B., and in 1918 a K.C.M.G. He has also been the recipient of honours from many British and foreign universities. He published in 1910 *The Prevention of Malaria*, and also produced *Psychologies*, a volume of poems (1910), and a romance, *The Revels of Orsera* (1920).

**ROSTAND, EDMOND** (1869–1920), French dramatist (see 23.754), devoted himself during the World War chiefly to the writing of patriotic verse. Various comic versions of *Cyrano de Bergerac* were performed by the soldiers at the front, one of which, *Cyrano de Bergerac aux Tranchées* (1916), was prefaced by Rostand with some of his own verses. He died in Paris Dec. 2 1920. His two sons, Maurice and Jean, have produced various works, the former having published a volume of poems, *Le Page de la Vie* and *Le Cerueil de Cristal*, and the latter an important pamphlet on wealth.

**ROSYTH** (see 14.718).—The development of the German navy in the first years of the 20th century rendered it necessary to create a British naval base suitable for a fleet concentrated in the North Sea, and in 1903 it was decided to establish a first-class naval base at Rosyth on the Firth of Forth. Land was acquired and works were planned, but the development of possibilities of torpedo attack soon made it evident that the outer anchorage, as originally designed, would be insecure, and naval opinion became doubtful as to whether the base would be adequate. The plans of construction were, therefore, modified in 1908, but, up to the outbreak of war, Rosyth was regarded as the principal base and headquarters for the Grand Fleet, though it was decided that initial stations must be established at Cromarty (see CROMARTY) and Scapa Flow (see SCAPA FLOW). When the war began, Admiral Jellicoe preferred to establish his headquarters at Scapa Flow, but Rosyth was used as a secondary base, particularly for the battle cruisers.

The Firth of Forth had been selected, before the war, as the eastern terminus of a mid-Scottland canal which was to connect with the existing canal and follow its line for part of the way, and then crossing the low ground in the neighbourhood of Stirling, to enter Loch Lomond, and ultimately to reach the sea by a short canal from Balloch to a point near Dumbarton. The canal was projected not only for commercial purposes but also to enable warships to pass safely and rapidly from W. to E. and to make the great Clyde shipyards easily accessible from the naval base at Rosyth, and thus to avoid the necessity of constructing docks and repairing yards there. The project was again under consideration during the war, but it was obvious that it could not be accomplished in time, and Rosyth was developed as a great dock-yard.

The original scheme included a high-level main basin covering an area of 55 ac., with an entrance lock from the fairway, a dry or graving dock 750 ft. long and 110 ft. wide, a submarine tidal basin, the construction of an entrance channel, and the erection of workshops and offices, and work was begun in 1909. The whole site of the works has been reclaimed from the sea, and a great sea-wall was built to form the southern boundary of the docks, the number of which was increased from one to three. Great progress had been made by the outbreak of war, and it was anticipated that the works would be completed by the summer of 1916. Operations were pushed on vigorously during the war, and a special Act of Parliament was passed in 1915 to facilitate the provision of dwelling-houses for Admiralty employees. By the original Act for the construction of the base, the whole area between the town of Dunfermline and the land purchased by the Government was brought within the municipal area, which was thus extended from 2,016 to 7,730 acres. The erection of houses has involved the construction of new roads, and new water and sewerage schemes.

**ROTHENSTEIN, WILLIAM** (1872– ), English artist, was born at Bradford, Yorks, Jan. 29 1872, and was educated at the Bradford grammar school. In 1888 he entered the Slade school, studying under Legros, and afterwards worked in Paris. In 1893 he began exhibiting at the New English Art Club. His paintings include "The Browning Readers" (1900), "The Doll's House" (1900), "Aliens at Prayer" (1904), "Jews Mourning" (1905), "Carrying the Law" (1910), "Morning at Benares" (1911), "Bourlon Church" (1919), and "The Last Phase: on the Rhine" (1919). Among his portraits may be mentioned those of Augustus John, Sir Francis Darwin (1905), Mr. Charles Booth (1908), Prof. Alfred Marshall (1908), Mr. Bernhard Berenson (1910), and Sir Rabindranath Tagore (1912); besides a portrait of himself (1900), now in the Metropolitan Museum, New York. His work is represented in many galleries, including the Dublin Gallery of Modern Art, the National Gallery, Melbourne, the National Portrait Gallery, Edinburgh, and the galleries of Bradford, Manchester and Johannesburg. He was in 1917 elected professor of civic art at the university of Sheffield. His published works include *Oxford Characters* (1896); *English Portraits* (1898); *The French Set*, and *Portraits of Verlaine* (1898); *Manchester Portraits* (1899); *Liber Juniorum* (1899); a *Life of Goya* (1900); *Plea for a Wider Use of Artists and Craftsmen* (1918); *Twenty-four Portraits* (1920).

His brother, **ALBERT DANIEL RUTHERSTON** (b. 1881), who took the name of Rutherton in place of that of Rothenstein in 1916, was born at Bradford Dec. 5 1881. He studied at the Slade school in 1898, and after 1901 exhibited regularly at the New English Art Club. He became well known as a theatrical designer of great taste and originality, his work including designs for *The Winter's Tale* (1912); G. B. Shaw's *Androcles and the Lion* (1913) and *Le Mariage Forcé* (1913). He also illustrated *The Children's Blue Bird* by Madame Maeterlinck (1913).

**ROTHERMERE, HAROLD SIDNEY HARMSWORTH, 1st Visct.** (1868– ), British newspaper proprietor and financier, was the second son of Alfred Harmsworth, and brother of Visct. Northcliffe (see NORTHCLIFFE). He was born April 26 1868 at Hampstead, London, was created a baronet in 1910, Baron Rothermere in 1914, and Visct. Rothermere of Hemsted after his services as Air Minister, in 1918. He married in 1893 Mary Lilian, daughter of George Wade Share. At the age of 21 he entered the publishing firm in which his brother Alfred (afterwards Lord Northcliffe) was then the principal, soon after the date when *Answers* was launched. He assisted in developing the business on sound and economic lines, and for the next 20 years he was the close associate of his brother in all his great undertakings and shared in his triumphs. His administrative and financial skill admirably seconded Lord Northcliffe in working out his original schemes. He took an important part in the reorganization of the London *Evening News*, when his business talent helped to make that once insolvent newspaper a large profit-yielder. He was one of the three principals in the establishment of the *Daily Mail* (1866), for many years controlled the finance of that newspaper, and was largely responsible for developing its methods of distribution. He was equally active at the Amalgamated Press, the gigantic periodical publishing

business which his brother had founded after the success of *Answers*. He founded the Glasgow *Daily Record*, bought the *Leeds Mercury*, and shared in the purchase of *The Times* (1908). He became known also as a most generous benefactor of charities. By the gift of a large sum he enabled the Union Jack Club to provide worthy accommodation for sailors and soldiers in London; and he gave £10,000 to the Territorial Force County of London Association. In 1910 he founded the King Edward chair of English literature at Cambridge, and in the same year he ceased his connexion with *The Times*, *Daily Mail*, and *Evening News*. In 1914 he acquired the *Daily Mirror* from Lord Northcliffe, and this henceforth became his special organ. In 1915 he founded the *Sunday Pictorial*, the first fully illustrated Sunday newspaper in London.

In the World War, Mr. Lloyd George, while Secretary for War, appointed Lord Rothermere in 1916 Director-General of the Royal Army Clothing Department. In the following year he accepted the office of Air Minister, under Mr. Lloyd George as Premier. He at once declared himself "whole-heartedly in favour of reprisals," which were the best means of carrying the war into Germany and protecting British towns against air attacks. Suffering from precarious health and his bereavements in the war, he resigned on April 25 1918, after he had carried out the fusion of the Royal Naval Air Force and Royal Flying Corps. "My second tragic loss in the war, ten weeks since," he wrote to the Prime Minister, "caused me great distress of mind and body . . . I was suffering from ill-health and insomnia." Immediately after the war he began a most energetic campaign against extravagance in national and local finance, himself contributing numerous articles to his newspapers.

The tragic losses to which he referred were those of his two sons, Capt. Harold Alfred Vyvyan St. George Harmsworth, M.C. (b. Aug. 2 1894) and Lieut. Vere Sidney Tudor Harmsworth (b. Sept. 25 1895), both of whom, after showing exceptional promise in civil fields, served with extreme gallantry in battle and fell in the national cause. Harold, in the Irish Guards, was twice severely wounded in 1915, and was then given a staff appointment in England. This he insisted on resigning and returned to his battalion at the front. There in Bourlon Wood, on Nov. 27 1917, he received mortal wounds of which he died on Feb. 12 1918. In recording the grant of the M.C. for his conduct on that occasion the *London Gazette* stated: "He led his company forward under heavy fire and himself put out of action two enemy machine-guns. It was entirely due to his splendid example that his company reached their objective." In his memory Lord Rothermere founded and endowed the Harold Vyvyan chair of American history at Oxford University in June 1920. Vere, educated for the navy which he had to leave owing to gun-deafness, joined the Royal Naval Division immediately after the outbreak of war, took part in the expedition to Antwerp, and, when his battalion was driven across the frontier into Holland, made his escape from Dutch internment. He was in the terrific fighting at Gallipoli and in the battle of the Somme, having refused a staff appointment, like his brother, because he was determined to share the fortunes of his men. Twice wounded in the storming of Beaumont on Nov. 13 1916, but still advancing and setting an example which, as his commander wrote, "thrilled with pride the men of his battalion," he was struck a third time by a shell and killed. In memory of him Lord Rothermere in 1919 established and endowed the chair of naval history at Cambridge which bears his name.

Lord Rothermere's third and only surviving son, Esmond Cecil (b. May 26 1898), who had served during the last part of the war in the Royal Marine Artillery, was in 1919 elected "anti-waste" M.P. for Thanet, and was then the youngest member of the House of Commons and the fifth of his family in Parliament.

**ROTHSCHILD, NATHANIEL MAYER, 1ST BARON** (1840-1915), Jewish financier, was born in London Nov. 8 1840, the son of Lionel Nathan de Rothschild, Austrian baron, head of the English branch of the famous financial family (see 23.758). He was educated at Trinity College, Cambridge, and in 1879

succeeded his father as Austrian baron. He sat in the House of Commons from 1865 to 1885 when he was created a peer by Mr. Gladstone, the first of his race and religion to be raised to the House of Lords. He was well known as an agriculturist as well as a financier, and he was renowned for his charities. He died in London March 31 1915.

His brother, **LEOPOLD DE ROTHSCCHILD** (1845-1917), who had been throughout associated with him in the management of the financial house, succeeded him as its head and also took over most of his public offices, besides interesting himself especially in the Jewish community and becoming president of the United Synagogue. He was an art collector and owner of race-horses. He died at Ascott, Leighton Buzzard, May 29 1917.

**ROUND, JOHN HORACE** (1854- ), English historian, only son of John Round, lord of the manor of West Bergholt in Essex, and through his mother grandson of Horace Smith, author of *Rejected Addresses*, was born at Brighton on Feb. 22 1854. He was educated privately, afterwards going to Balliol College, Oxford, where he took a first-class in modern history. The teaching of Dr. Stubbs, then Regius Professor of History, greatly stimulated the young student, whose independent and critical genius had already begun to revolt against the superficial methods of historical study traditional in the English schools, and after a few years he devoted himself to historical research. His own aim as a historian, as stated by himself, was "to add to or correct our knowledge of facts" (preface to *Feudal England*), and from the first he insisted that students of mediæval history must go to the records in order to find evidence to supplement and check the chroniclers on whom historians of the type of Freeman had too exclusively relied. In 1883 he published in the *Antiquary* a criticism of Brewer's introduction to the *Book of Hoveth* (Rolls Series), in which he proved that the author was "strangely at fault" in his views on its authorship, its origin and its contents; and three years later, in his *Early Life of Anne Boleyn*, he again pointed out errors "on the simplest matters of fact" made by the same eminent scholar. In 1884-5 he published in a magazine articles on "The Origins of the House of Lords" (reprinted in *Pecrage and Pedigree*, 1910), in which he argued for "that feudal origin of the House which, in view of the teaching of Freeman and Stubbs, it was, at that time, heresy to assert." In 1888 appeared his edition of *Ancient Charters, Royal and Private, prior to 1200* (Pipe Roll Soc. vol. x.), in the preface to which he pointed out their use for genealogy, topography, legal and ecclesiastical antiquities, etc. In 1891 appeared his *Introduction of Knight-service into England* (privately printed, reprinted in *Feudal England*, 1895), in which he proved the entirely Norman and feudal origin of this institution (see the article by Round in the *E.B.* 15.867).

In 1892 he published in the *Quarterly Review* (vol. 175, No. 349) his famous attack on Freeman's historical method. He accused him of working as a historian "not from manuscripts, but from printed books," and pointed out "the danger to our national school of history in the wide-spread and almost superstitious belief in his unimpeachable authority." This authority he proceeded to assail, centring his attack on that "palisade" of solid timber which, in his *Norman Conquest*, Freeman had imaginatively built round the English host at "Senlac," and proving that this palisade had as little existence as "Senlac" itself (see *E.B.* 13.59 note). Round had begun openly to attack Freeman as early as 1882, but the fact that the *Quarterly* article, though written before Freeman's death, did not appear till afterwards excited unjust comment, and blinded the dead historian's friends to the convincing force of the criticism itself. The long and bitter controversy that followed was summed up by Round in "Mr. Freeman and the Battle of Hastings" in *Feudal England*. In 1892 also appeared *Geoffrey de Mandeville*, a study of the anarchy under Stephen, which established the author's reputation as a constructive historian. In *Feudal England*, which appeared in 1895, Round published in collected form some of the results of his researches into the history of the 11th and 12th centuries, the first part of the book setting forth views as revolutionary on the Domesday side and the whole system of land

assessment as on the actual introduction of the feudal system into England. In 1899 was published his *Calendar of Documents preserved in France illustrative of the history of Great Britain and Ireland*, vol. i., pp. 918–1206, and also another collected series of studies under the title of *The Commune of London*. In the following year he published his *Studies in Peerage and Family History*, and at the Congress of Archaeological Studies he read a paper (subsequently published) on “the systematic study of our English place-names,” in which he again pointed out the impossibility of accomplishing any scientific work in the department of research until the place-names of England had been classified and traced to their origins.

Round's vast and detailed knowledge of the periods which he had made his own led to his opinion being sought by successive law officers of the Crown charged with the conduct of peerage cases brought before the House of Lords. His attention was thus drawn to peerage law, and he soon discovered that there “was room for its treatment on fresh and historical lines.” In 1910 he published *Peerage and Pedigree*, containing studies on peerage law and its problems, in which incidentally he attacked “the muddle of the law,” pointing out that the lawyer, whose vision is bounded by his “books,” is still in the Middle Ages, while the historian is a man of science. Although the labour involved in these peerage cases was immense, Round refused to accept any remuneration; in 1912, however, his services were publicly recognized by the creation in his favour of the new office of Honorary Adviser to the Crown in Peerage Cases. His passion for historic truth led him to wage ruthless war on the “pedigree-mongers,” whom he attacked with mordant wit (see, e.g. in *Peerage and Pedigree*, “Some ‘Saxon’ Houses,” “The Great Carington Imposture”), and on those who were attempting to give a false value to the possession of coats-of-arms (*ibid.* “Heraldry and the Gent”). Occasionally he extended the range of his attacks, falling, for instance, upon those who, consciously or unconsciously, falsified history in the interests of particular political or religious opinions (e.g. “The Elizabethan Religion, in correction of Mr. George Russell,” *Nineteenth Century*, vol. xli., p. 101).

History on a large scale Round never attempted. His books are all collections of particular studies, and they represent but a tithe of his published work. He edited, with prefaces, a whole series of the Pipe Rolls; he was a frequent contributor to the *English Historical Review*; he helped to edit the *Ancestor*, for which he also wrote; and innumerable papers by him are scattered in various historical and archaeological journals and reviews. In 1913 he had begun to prepare a catalogue of these scattered works, but in 1921 this had not yet been published. Round's historical method—reaching conclusions by induction from isolated facts whose connexion he had in turn to prove—prevented his becoming a popular writer; but his style is always luminously clear, and the articles contributed by him to this *Encyclopaedia* (DOMESDAY, KNIGHT SERVICE, BARON, BARONET, EARL, BAYEUX TAPESTRY, SCUTAGE, the families of FITZGERALD and NEVILLE, etc.) are excellent examples of his capacity for concise statement. (W. A. P.)

**ROUVIER, MAURICE** (1842–1911), French statesman (see 23,781), died at Reuilly-sur-Seine June 7 1911.

**ROVNO, BATTLE OF.**—The Rovno operations played an important part in the Russian campaign of 1915 on the eastern front (see EASTERN EUROPEAN FRONT CAMPAIGNS).

In consideration of Austro-Hungarian troops having been set free by the rally of Mackensen's group of armies in their victorious march on Brest Litovsk, and of the connexion between the Russian N.W. and S.W. fronts having been broken by the withdrawal of the former N. of the Polyessie, the Austro-Hungarian army Higher Command decided, on Aug. 27 1915, to take the offensive with the army front which had been inactive on the Zlota Lipa and the Bug. The objects in view were Rovno (Rowne) and the liberation of the east portion of East Galicia.

The S. wing of the II. Army under Böhm-Ermolli, and the N. wing of the Southern Army under Bothmer, made a successful attempt to break through Shtcherbachev's XI. Army in the

battle at Gologory and on the Zlota Lipa. Bothmer's S. wing and the N. wing of the VII. Army engaged Lechitski's IX. Army; Puhallo advanced with the main body of the I. Army towards the bent back N. wing of Brussilov's VIII. Army to throw it back on Dubno; and Field-Marshal Roth-Limanowa pushed forward on the Kovel (Kowel)–Luck road in order to capture from the Russians the command of the northern flank. Puhallo's advance decided Ivanov to break off the battles and to withdraw Brussilov during the night, and Shtcherbachev and Lechitski's N. wing on the 28th and 29th to a position behind the Sierna, on the watershed between the Bug and the Styra, on the Zloczów heights and behind the Strypa. The S. wing and centre of the Austro-Hungarian front followed immediately in pursuit, and in consequence two battles developed, after the occupation of the Russian position: one, on the 30th on the Strypa, from whose bridgeheads Shtcherbachev and Lechitski delivered mighty blows against Bothmer's S. wing and Pflanzer-Baltin's N. wing; the other, on the 29th at Zloczów, where Böhm-Ermolli attempted to break through.

Puhallo only arrived before Brussilov's front on the 29th and had to put off attacking until the 31st. Roth, having encountered opposition at Rozyszcze on the 29th, had advanced with the main body across the Styra at Sokul, and that day began a forced march towards Luck. The XXXIX. Corps, brought up by train, flung itself upon him but was defeated on the 30th.

Ivanov made Brussilov withdraw in the night behind the Putilowka and go into position at Olyka, Mlynov, Kozin and the source of the Ikwa. Luck was surrendered. Shtcherbachev held the Zloczów heights until the morning of Sept. 1, although he was surrounded on the N. and his front was broken through in places. He then retired to the position Radziwillow–Podkamien–Zalozce.

Lechitski was still holding out on the 1st, in spite of the failure of his counter-assaults, and Pflanzer-Baltin therefore delivered an assault with his group, established N. of the Dniester close to the mouth of the Sereth. During the night the Russians fell back on to the strongly fortified Sereth position, which was provided with several bridgeheads.

Ivanov hoped that his N. wing, which had been bent back a long way and was difficult to envelop owing to the adjacent marsh area, and had, further, been reinforced by fortress artillery from Rovno, would be able with the aid of flank attacks from the region of dense forests and impassable swamps known as Polyessie (“the Woods”) to hold out until the S. wing, opposed by far weaker forces, should have lifted the whole front off its hinges by a victorious assault.

The Austro-Hungarian army Higher Command arranged for the N. wing, now divided into two armies under Archduke Joseph Ferdinand, to deliver a decisive blow by means of assaults on Rovno and Dubno; for Böhm-Ermolli to break through in the centre of the Russian front; and for Bothmer and Pflanzer-Baltin to contain the Russian forces by an attack on the Sereth position. Lechitski wanted to employ the time until his N. and Shtcherbachev's S. wing should be ready, by removing the threat to his flank offered by Pflanzer-Baltin's troops, who had advanced on both sides of the Lower Sereth. These battles on the 4th and 5th, combined with a simultaneous attack on the Bukovina, failed in their object.

While Bothmer was grouping his army for a break-through S. of Tarnopol, and Pflanzer-Baltin's N. wing was waiting to attack simultaneously with him on the 7th, the Russians, on the afternoon of the 6th, opened the battle of the Sereth (the battle of Tarnopol) with a great mass assault from the Trembowla area. On the same day Böhm-Ermolli finished the battle at Podkamien, begun on the 2nd, with a victory that resulted in Shtcherbachev's N. wing retiring as far as Butyn on the Goryn, while Brussilov's S. wing, abandoning Dubno, fell back behind the Middle Ikwa.

Archduke Joseph Ferdinand's I. and IV. Armies, which had come up in front of the Russian positions on the 2nd, defended themselves against numerous counter-assaults, by which Brussilov was trying to prevent the diversion of troops to the N.

wing. The pressure on the flank from Polyesie grew, and it became imperative to bring up all cavalry divisions within reach. These became entangled in difficult minor combats in the midst of forest and marsh. On Sept. 8 Archduke Joseph Ferdinand delivered at Cuman the blow which decided the battle of Olyka. Brussilov escaped by retreating behind the Stubla.

These successes barred the advance of the Sereth front, which by 7 P.M. had forced back Bothmer's and Pflanzer-Baltin's inner wings as far as the Strypa. Böhm-Ermolli's S. wing executed a relief attack E. of the Sereth towards Zbaraz. Ivanov, in his anxiety for his N. wing, ordered the S. wing reserve to be diverted and sent to its relief. This wing was for the moment endeavouring to cover the flanks of the attack-group which had advanced a great distance, but could overpower neither Bothmer's N. wing in the direction of Tarnopol nor the troops in the foreground of the Zaleszczyki bridgehead. On the 10th the Archduke Joseph Ferdinand began the battle of the Stubla, which he hoped to bring to a decision by sending the N. wing to cross the Goryn below the mouth of the Stubla, and then make an advance on Rovno simultaneously with that of Puhallo's army coming from Dubno. By the 12th the road to the Goryn had been made clear, one division brought across the river, and the groups which threatened the N. wing driven back a considerable distance.

The arrival of Russian reinforcements opposite to Böhm-Ermolli's sparsely occupied front, as well as the arming for a continuation of the Sereth front's advance, showed that Ivanov was planning a great offensive on both sides of the Tarnopol-Lemberg line. The Austro-Hungarian army Higher Command stopped Puhallo's advance, drew back Bothmer's N. wing to the level of the Strypa front and dispatched thither the VI. Corps which had been intended for use against Serbia.

On the 13th the counter-offensive set in with the battle of Krzemieniec-Gontowa, and won some initial successes. The N. wing's attack was now also stopped. On the 14th the Russians broke through the Strypa front and reached the W. bank. The VI. Corp's attack, together with an advance by Bothmer's N. wing and a group of Böhm-Ermolli's posted W. of the Sereth on the N. flank, caused the Russians to retire again in the night of the 16th-17th to their Sereth position. During this time Böhm-Ermolli had repulsed the assault, and used the reinforcements sent by the Archduke for an attack. But a calamity had overtaken the N. wing. Keeping the attention of the weakened group of armies on the Stubla cleverly riveted, Brussilov with the XXX. Corps on the 15th threw back the N. wing behind the Putilowka and forced the Archduke, by continuous envelopment, to retreat behind the Styra and the Ikwa on the evening of the 17th. The bridgehead at Luck could not hold out, and on the 23rd the Russians stood on the E. bank of the river. On the same day Shtcherbachev and Brussilov's S. wing advanced to the attack on the II. Army and Puhallo's I. Army, now under command of Böhm-Ermolli, from the Upper Sereth to the mouth of the Ikwa. This second battle of Krzemieniec ended on the 25th with the failure of the Russians. At the same time Brussilov received the news that German troops had taken part in the storming of the bridgehead at Kolki on the Styra. Recognizing the intentions of the allies, he at once ordered a retreat to the Putilowka position, while concentrating a powerful group to the N. of the Kormin brook to fall on the enemy's flank.

Linsingen, the new commander of the IV. Army and of the troops in Polyesie, was in fact planning a blow on the Russian flank and rear by way of Kolki-Sokul, using for this purpose the German XXIV. Reserve Corps (brought up from the German front through Polyesie after Gyllenschmidt's forced retreat behind the Wiesiolucha and the Styra) and the Austro-Hungarian XVII. Corps which was to have been sent against Serbia. Gerok's group, the XXIV. Reserve and the XVII. Corps, had now to do with nothing but rearguards, who by the 27th had been overthrown. On the 28th, when Shtcherbachev at the battle of Nowo Aleksiniec again attacked Böhm-Ermolli in order to keep his forces engaged, the main body of the N. wing arrived at the Putilowka. Linsingen guessed Brussilov's scheme,

made Gerok wheel to the N.E., and intercepted the Russian blow. The allies' decision to grant the much-exhausted troops some rest in a permanent position brought the battle of the Putilowka to an end on the evening of the 30th.

The Russian command refused to be satisfied with this close to a campaign which had not brought them much gratification. On Oct. 3 Gyllenschmidt delivered a flank blow from Rafalowka, W. of the Styra, but was driven completely back by the 6th. The attack against Serbia was a spur to renewed exertions. On the 6th a fresh battle set in on the Putilowka, which on the 7th spread over the whole front up to the Rumanian frontier, lasting until the 10th—until the 13th on the Strypa—without a change in the situation. On the 15th Ivanov once more delivered a blow on the N. flank in the bend of the Styra at Czartorysk, which at first made great progress. But Linsingen's clever concentric placing of the hurriedly brought-up reinforcements drove the Russians back with heavy fighting behind the Styra by Nov. 14. During the crisis Shtcherbachev had attacked the II. Army in vain from Oct. 21 to 23 in the second battle of Nowo Aleksiniec. More dangerous still were the Russian attempts to break through on the Strypa from Oct. 30 to Nov. 8, which culminated in the struggle for the village of Siemikowce. Finally in the middle of Nov. a prolonged lull fell upon this theatre of war. (M. H.)

**ROWELL, NEWTON WESLEY** (1867— ), Canadian politician, was born Nov. 1 1867 in Middlesex county, Ontario. He was called to the bar in 1897, and became head of the law firm of Rowell, Reid, Wood & Wright, Toronto; ultimately being made bencher of the Law Society of Upper Canada in 1911. He stood unsuccessfully as a Liberal for the Dominion Parliament at the general election of 1900, but in 1911 was elected to the Ontario Legislative Assembly for N. Oxford. From 1911-7 he was leader of the Liberal Opposition in the Ontario Legislature. On Oct. 1917 he entered the Federal Unionist Government as president of the council and vice-chairman of the War Committee of the Cabinet, and was elected to the Dominion House of Commons for Durham county, Ontario, Dec. 1917. He was a member of the Imperial War Cabinet and Imperial War Conference, 1918; Canadian Government representative at the International Labour Conference at Washington, 1919; and a Canadian delegate to the first assembly of the League of Nations at Geneva, 1920. He resigned his seat in Parliament in May 1921.

**ROWING:** see SPORTS AND GAMES.

**ROYCE, JOSIAH** (1855-1916), American philosopher, was born at Grass Valley, Cal., Nov. 20 1855. He graduated from the university of California in 1875 and the following year went to the newly established Johns Hopkins University, being one of the extraordinary first group of fellows elected there. After receiving his Ph.D. in 1878 he was instructor in English literature and logic for four years at the university of California. In 1881 he prepared *A Primer of Logical Analysis* for students of English composition. In 1882 he was called to Harvard where he taught as instructor in philosophy, assistant professor (1885-92), professor of the history of philosophy (1892-1914) and Alford professor of religion, moral philosophy, and civil polity (after 1914). He was the leading American exponent of idealism (see 14.284) and his works were distinguished for their literary qualities. He was made a member of the National Institute of Arts and Letters, and received hon. degrees from Harvard, Yale, Johns Hopkins, Aberdeen, St. Andrews and Oxford. After the outbreak of the World War he was a staunch supporter of the Allies, and on Jan. 30 1916, in a notable address delivered in Tremont Temple, Boston, advocated a breach with Germany. He died in Cambridge, Mass., Sept. 14 1916.

He was the author of *The Religious Aspects of Philosophy* (1885); *California* (1886, in the American Commonwealth Series); *The Feud of Oakfield Creek* (1887, a novel); *The Spirit of Modern Philosophy* (1892); *The Conception of God* (1895); *Studies of Good and Evil* (1898); *The World and the Individual* (2 vols., 1900-1, Gifford Lectures at the university of Aberdeen) *The Conception of Immortality* (1900); *Outlines of Psychology* (1903); *Herbert Spencer. An Estimate and Review* (1904); *The Philosophy of Loyalty* (1908); *Race Questions, Provincialism and Other American Problems* (1908);

*William James and Other Essays on the Philosophy of Life* (1911); *Bross Lectures on the Sources of Religious Insight* (1912); *The Problem of Christianity* (2 vols., 1913, lectures before Manchester College, Oxford); *War and Insurance* (1914); *The Hope of the Great Community* (1916, war addresses) and the posthumously published *Lectures on Modern Idealism* (1919).

**ROYDEN, AGNES MAUDE** (1876– ), English social worker and preacher, was born at Mossley Hill, Liverpool, Nov. 23 1876, the daughter of Sir Thomas Royden, 1st Bart., of Frankby Hall, Birkenhead. She was educated at Cheltenham Ladies' College and Lady Margaret Hall, Oxford, and afterwards for some years did settlement work in Liverpool. She also lectured on English literature for the university extension movement, and in 1909 was elected to the executive committee of the N.U.W.S.S. From 1912 to 1914 she edited the *Common Cause*, the organ of the union. Miss Royden became well known as a speaker on social and religious subjects, and in 1917 became assistant preacher at the City Temple, being thus the first woman to occupy this office.

**RUBBER** (see 23.795\*).—Since 1910 the rubber industry has developed very largely and taken increased importance in the commercial world. The word rubber is applied to three different substances: (a) an elastic solid, the chief constituent of the coagulated latex or milk of a great variety of trees, shrubs, vines and plants, as Pará rubber; (b) an elastic solid found in solution in the tissues of a few shrubs and vines, as Guayule rubber; (c) a chemical product from isoprene or homologous hydrocarbons, as synthetic rubber. In all commercial rubber caoutchouc exists in two forms, one fibrous or hard, the other viscous and soft. In the best trades the fibrous form preponderates. The soft form can be dissolved by benzol and many other substances of that class; the fibrous form swells but does not dissolve. Vulcanization (the chemical union of caoutchouc and sulphur) hardens the viscous portion. As the result of this process the rubber becomes less sensitive to heat and cold and to the effect of acids and alkalis and becomes more durable. A small amount of sulphur in rubber produces soft rubber. By using more sulphur and greater heat a very hard black substance called hard rubber is obtained. Moulding India rubber consists of softening by heat the stiff rubber dough until it is plastic, pressing it into a mould and vulcanizing it at a heat much less than that required to melt it; not in melting, pouring and casting according to popular misconception. Rubber once melted remains a sticky, worthless semi-fluid.

*Wild Rubber*.—At first there were but three types of rubber to be found in the world's markets: India rubber, the product of the *Ficus elastica* from Assam, Burma and Java; gum elastic,

the product of the *Hevea brasiliensis* from S. America, and "virgin gum" from the *Castilloa elastica* of Central America. In 1921 all grades from whatever source were termed India rubber, and there were some 200 sorts. They were divided generally as follows: (1) S. American rubber, from the *Hevea brasiliensis* and kindred species which comprised Pará rubber in 3 general grades and 20 sub-grades; Cacrá rubber (Manicoba) from the *Manihot glaziovii* and kindred species, 6 grades; Mangabeira from the *Hancornia speciosa*, 2 grades; and Caucho rubber from the *Castilloa ulei*, 3 grades. (2) Central American rubber, known as "centrals," the product of *Castilloa elastica* and kindred species, some 25 grades; virgin rubber, the product of the *Sapium tolimense* and kindred species, 3 grades; Guayule rubber, from the *Parthenium argentatum*, 12 grades. (3) African rubber, a lower grade of wild rubber, produced by a great variety of vines of the *Londolia* genus and to a degree from trees, as the *Ficus vogelii* and the *Funtumia elastica*. The number of grades was 120. (4) E. Indian rubber, the product chiefly of the *Ficus elastica* from Rangoon, Penang and Java, 9 grades; together with Borneo rubber from the *Willoughbia firma*, 3 grades; Pontianak (Jelutong), from the *Dyera costulata*, 4 grades. (5) Plantation rubber. From 1860 attempts to cultivate rubber-bearing trees and vines have been undertaken in various parts of the tropical world. The most persistent and finally the most successful were carried on in the British experiment stations and Royal botanic gardens, especially in Ceylon and the Straits Settlements. A measure of success was attained in cultivating the *Manihot glaziovii*, the *Castilloa elastica*, the *Ficus elastica* and the *Funtumia elastica*. All of them proved to be good rubber-producers but could be tapped only at intervals of several months. The product found ready sale, and considerable plantations of *Manihot* in Ceylon, and *Ficus* and *Castilloa* in the Federated Malay States were installed. American interests also planted thousands of acres of *Castilloa* in Mexico, Nicaragua and Guatemala. Experiments with another tree, however, the *Hevea brasiliensis*, developed the fact that through what was termed "wound response" it could be tapped daily without injury. This process in brief was the opening of the tapping cut by the removal daily of a thin shaving of the bark. The amount from each tapping was small, but the year's product far exceeded that of the planted trees of any other sort. The result was that most of the others were abandoned or destroyed and the *Hevea brasiliensis* put in wherever it could possibly thrive. Thus the *Hevea* plantation product, which in 1900 was four tons, increased to 8,400 tons in 1910, and from then on the increase was very large, as shown in the table below.

*Hevea Plantation Acreage and Production.*

	Plantation Acreage	Plantation Production (tons)	Total Wild Rubber Production (tons)	Total World's Production (tons)
1910	1,122,550	8,200	62,300	70,500
1911	1,505,350	14,419	60,730	75,149
1912	1,817,350	28,518	70,410	98,928
1913	2,021,750	47,618	60,822	108,440
1914	2,181,050	71,000	49,000	120,380
1915	2,293,750	107,867	50,835	158,702
1916	2,458,950	152,650	48,948	201,598
1917	2,611,350	213,070	52,628	265,698
1918	2,759,950	255,950	40,629	296,579
1919	2,900,000	285,225	41,775	327,000
1920 <sup>1</sup>	3,200,000	320,000	40,000	360,000

<sup>1</sup> Estimated.

*Distribution of the World's Rubber Production (Gross Tons).*

Approximate World Consumption of Rubber, 1920.

United States . . . . .	260,000 tons
Great Britain and Colonies . . . . .	50,000 "
France . . . . .	20,000 "
Italy . . . . .	10,000 "
Japan . . . . .	8,000 "
Other Countries . . . . .	16,000 "
Total . . . . .	364,000 tons

**Synthetic Rubber.**—From the time when India rubber began to be important in the arts, its synthetic production was the dream of the inventor. Analysis of rubber with a view to ultimate synthesis was made between 1835 and 1840 by Dalton, Liebig, Himly, A. Bouchardat and Gregory. A more systematic attempt to isolate and examine the products in crude caoutchouc distillate was made in 1860 by Greville Williams, the English chemist. He obtained isoprene,  $C_5H_8$ , a hemiterpene, a fluid boiling at  $37^\circ C$ , and a hydrocarbon now known as dipentene, boiling at  $170$  to  $173^\circ C$ , which he named "hevene." An important step towards the production of artificial rubber was that taken by Gustave Bouchardat of the Paris School of Pharmacy in 1879, when, in studying the action of hydrochloric acid on isoprene, he noted the formation of a substance having the same percentage composition as isoprene, lacking chlorine, possessing elasticity, insoluble in alcohol but soluble in ether and carbon bisulphide like natural rubber, and yielding on distillation the same hydrocarbon as caoutchouc. Sir William Tilden, the English chemist, in 1882 observed the polymerization of isoprene and that it could be converted into true caoutchouc with certain chemical reagents. In 1884 he obtained isoprene by passing the vapours of turpentine through a hot tube. In 1887 Prof. Otto Wallach of the university of Göttingen noted that isoprene undergoes polymerization on exposure to light with the production of a rubber-like mass, and Tilden in 1892 showed that such material could be vulcanized with sulphur. The synthesis of isoprene and, as a consequence, that of caoutchouc, was accomplished in 1897 by Prof. Euler-Chelpin of the university of Stockholm. In 1909, due to the rapidly mounting cost of natural rubber, greater efforts were made to produce the artificial kind on a commercial scale, the problem being attacked in England by W. H. Perkin, his assistant Weizmann, and Francis Matthews; by August Fernbach in France; and in Germany by the Bayer and Badische companies. In 1884 Tilden suggested that not only isoprene but its homologues should be capable of similar polymerization. Now these bodies, chief among them butadiene, form the basis of methods for obtaining synthetic caoutchoucs. Dr. Fritz Hofmann and Dr. Carl Coutelle, chemists in Germany, in 1909 devised a process for making absolutely pure isoprene, converted it into rubber by heating it in a closed tube or in the presence of other substances, and sent the sample to Prof. C. D. Harries, of Kiel University, who pronounced it true rubber. In 1910 Prof. Harries showed that isoprene could be converted into rubber by heating it in a closed tube with glacial acetic acid. He had in 1905 determined the chemical constitution of natural rubber. The German scientists did not confine themselves to isoprene but experimented successfully with the homologous hydrocarbons suggested by Tilden. Harries and the English investigators, Matthews and E. Halford Strange, noted independently that polymerization proceeds at great velocity in the presence of metallic sodium and the resulting rubber differs much in its properties from that produced by mere heating. German chemists observed different results when polymerization by sodium was carried on in an atmosphere of carbonic acid. A later process in Germany was based on the use of ozonizers on sodium hydrogen peroxide as catalysts. Some of the synthetic rubbers are soluble, elastic, and may be readily vulcanized; others possess only some of these qualities. They are obtained from butanes, dimethylbutanes, and from isoprene, and in each of the three classes are to be found standard ozonide, carbonic acid and sodium rubbers.

Despite this wide range of materials with their possible use in the arts, the making of synthetic rubber is still a minor industry as com-

pared with the production of natural rubber and the manufacture of goods therefrom. In the manufacture of the hydrocarbons of the isoprene series for synthetic rubber there are such large quantities of by-products that their removal or utilization presents a problem more difficult than the production of the artificial rubber; hence competition with natural rubber is very unlikely. Synthetic rubbers lack the durability of natural rubber, possibly because they lack the resins, albumen, etc., which act as protective colloids to lessen the vulnerability of the natural article. Then, too, for a wide range of needs, synthetic rubbers cannot be substituted for natural rubber because the latter product is a uniform vegetable substance, not a mixture like the artificial product. While synthetic rubber must be greeted as a chemical triumph, it is not an industrial success, and must still be classed commercially with the more or less haphazard production of alleged rubber substitutes prepared, often by honest inventors and manufacturers, from oils, gums, cellulose, or in fact anything that will produce a waterproof plastic.

**Reclaimed Rubber.**—In few other industries is conservation such an important factor as in rubber manufacture. Nearly all kinds of worn-out vulcanized goods are collected and the basic material recovered to be compounded, manufactured and vulcanized again into new articles that compare favourably with those made from new gum. To so many uses is devulcanized or reclaimed rubber now put, that its annual consumption fully equals that of new crude gum. Experiments early demonstrated the value of "reclaim," and while the more conservative long looked askance at the utilization of "refuse rubber," buyers of goods made wholly or in part from the regenerated material found that for most purposes the goods were practically as serviceable as those made directly from fresh gum. The element of cost, too, played an important part in popularizing reclaimed rubber, as articles made of it could be produced and sold for much less than those made with new gum only, and to a considerable degree the price of the crude gum has been kept from rising too high by the ample supply of the reclaimed. As the advantages of reclaimed rubber became better appreciated, and as through the activities of rubber chemists and manufacturers the quality of the product was improved, it became an important factor in the industry. To meet more satisfactorily the fast-growing demand, large companies with world-wide connexions and specialized equipment soon supplanted the small reclaimers. Such concerns employ not only the most modern machinery but also maintain research and analytic laboratories for control of the processes, for standardizing the products, and for the study of reclaiming and compounding problems.

The first attempt to reclaim rubber commercially was that made in the early fifties when Hiram L. Hall, the pioneer manufacturer in Massachusetts, boiled powdered vulcanized rubber in water and then sheeted it. Francis Baschnagel, an early American experimenter, next patented a method for devulcanizing rubber, finely ground, by exposing it to live steam. An important later development was the destruction of fibre in the ground material by means of acids, chiefly sulphuric, for which processes over 50 patents were granted, which incidentally became the subject of much litigation. The acid process was of use chiefly in the reclaiming of worn-out footwear or "dry heat" goods, but was not of great value in recovering other waste. The alkali process, patented by Arthur Hudson Marks, an American manufacturer, solved the latter problem. In this, caustic soda was used to destroy the fabric and incidentally it proved to be the most effective agent in desulphurizing the mass. The entire removal of not only the free sulphur from vulcanized rubber (which modern reclaiming accomplishes) but also of the sulphur which during curing unites chemically with the crude rubber, is the goal towards which experimenters were striving in 1921. Notable progress in this direction had been made in England by Dr. David Spence, who used an accelerator, aniline-potassium, but in solution in excess of aniline. He claimed not only the dissolution of the waste rubber but the liberation in soft rubber of from 78% to 90% of the combined sulphur, and the changing of the latter into an insoluble alkaline sulphide. In hard rubber 73% of the combined sulphur was said to be similarly reduced.

**Vulcanization**, or curing, is effected generally by either the heat cure or the cold cure. In the first-named method either steam or heated air is employed. A wide range of rubber goods, either in moulds wrapped with strips of cloth, or imbedded in pans of French talc to preserve their shape, is very efficiently cured with live steam in various types of vulcanizers. For many other needs the dry-heat cure, in which the goods are placed in a hot compartment without either wrapping or mould protection, has

been found serviceable. Still another heat cure, now but little used, is that of solarization, whereby the fabrics, coated with a thin skin of rubber, are exposed to the sun's rays for vulcanization. In very exacting work, such as the vulcanizing of hard-rubber sheets, curing is effected by immersion of the material in hot water. In the cold cure either the acid or the vapour process is employed. In the former, goods are dipped in solution of chloride of sulphur dissolved in bisulphide of carbon, after which they are given an alkali wash. For the vapour cure, rubber goods are suspended in a heated compartment in which the fumes of chloride of sulphur pass freely over the surfaces to be vulcanized. Over-curing is checked by the admission of ammonia fumes.

Since Charles Goodyear (see 12.240) in 1839 discovered, and in 1844 patented, his process for vulcanizing rubber with sulphur by means of heat, numerous attempts have been made radically to improve on his method and material; but the bulk of the rubber goods produced is still cured by the sulphur and heat method. In the long train of experiments, many of which have led to important results, the curing of rubber has been effected by the use of sulphates, sulphides, chlorides, nitrates, fluorides, bromides, iodides and phosphates of nearly all the common earths and metals, as well as chlorine, sulphurous acid and various gases. The Russian chemist Ivan Ostro-mislensky, in later experiments, succeeded in vulcanizing rubber with trinitrobenzene and other nitro-compounds so as to impart all the qualities given it by sulphur, effecting the curing more rapidly than with sulphur, and with but one-twelfth of the material, while a lower temperature was maintained during the cure. Victor Henry, a French chemist, also reported in 1909-10 that he had effected the vulcanization of thin layers of rubber solutions by means of the ultra-violet rays, and others have made similar researches along the same line that have much scientific if not practical interest. The period of vulcanizing ranges from a few minutes to many hours, depending on the degree of heat employed, the nature of the compound, the thickness of the goods, etc. Factors which affect the rate of cure, as shown in England by Dr. Philip Schidrowitz, are the amount of protein or nitrogen in the crude gum, its stay in storage, its density, the amount of smoke, formalin or other preservatives used, quantity of acid used in coagulating the latex, time in drying, age of latex-yielding tree, etc. An important vulcanization development is the chemical process of vulcanization described by S. J. Peachey, the English chemist, in 1918, after an investigation of the behaviour of rubber towards the various allotropic forms of sulphur. Unlike the Parkes process, which yields an addition-product of both sulphur and chlorine, this leads to the formation without the aid of heat of a sulphur addition equal to that produced by the hot-curing process. By it rubber, alone or compounded with fillers and pigments, is exposed successively to the action of two gases, sulphur dioxide and hydrogen sulphide. Diffusing through the rubber and interacting, the gases produce an especially active form of sulphur capable of combining with and vulcanizing the rubber at the ordinary temperature, and more thoroughly than by either the hot process or the sulphur-chloride cure. A density is acquired, it is said, unattainable by the older methods. The dual gas treatment can be used either for rubber in its original solid form or liquefied with a solvent. In the latter case the gases effect a complete petzification of the solution, forming a jelly which, on evaporating the solvent, is found to be fully vulcanized rubber. One of the advantages claimed is that fabrics, as well as organic fillers such as leather waste, sawdust, woodmeal, etc., that would be more or less decomposed by the hot cure or the sulphur-chloride cure, could be used with rubber for a wide variety of new and useful purposes, as in the making of fine or heavy reformed leathers, linoleums, etc. It may also effect a considerable improvement in the waterproofing of cloth. Rubber footwear, it is said, may be produced by the new process without either the heat or pressure hitherto deemed essential, and without special machines for stitching and riveting, thus greatly cheapening the product. An additional advantage pointed out is that this process makes it possible to use both natural and coal-tar colouring-matter in rubber, so as to obtain both deep shades and delicate tints impossible with the old methods of vulcanizing.

**Organic Accelerators in Vulcanization.**—The recent discoveries of Dr. Spence and others that certain organic substances, termed accelerators or catalysts, mixed with rubber, notably hastened the process of vulcanization, have caused a revolution in compounding and vulcanizing. Mineral or inorganic catalysts, such as litharge and magnesia, had been in use since the discovery of vulcanization. The organic type was, however, unknown until in attempts to vulcanize synthetic rubber it was found necessary to add organic accelerators to effect the union of sulphur and the rubber-like substance. It was but a short step to their use in connexion with natural rubber, and the results were surprising. In fact, the time required in vulcaniza-

tion was reduced by one-half, thus doubling the vulcanizing output without extra heat or pressure. The theory of catalytic action, according to M. André Dubosc, an eminent French chemist, is explained as follows. He found that when a typical organic accelerator derived from an amine, such as hexamethylene tetramine, was mixed with sulphur, placed in a sealed tube, and heated to 135°-145° C., not only carbon sulphide or hydrosulphuric acid but also sulphocyanic acid was evolved. At the vulcanization temperature, sulphocyanic acid separated, yielding hexavalent sulphur and cyanhydric acid. While the same temperature was maintained, this acid combined in the presence of ordinary divalent sulphur, producing unstable sulphocyanic acid which by dissociation again furnished hexavalent sulphur. M. Dubosc holds that cyanhydric acid is the true active agent in such catalysis, the practical effect of which is the transformation of ordinary divalent sulphur into hexavalent sulphur. Assuming that vulcanization is the saturation by sulphur of a double bond in the rubber molecule, then by saturation of two such bonds the speed of the reaction between sulphur and rubber should be doubled, and by saturation of three bonds the speed would be tripled. Saturation is accomplished with hexavalent sulphur generated during vulcanization through catalysing action of cyanhydric acid, evidently the true accelerator, and corresponding to Dr. Spence's "active principle." While a single molecule of rubber reacting with ordinary divalent sulphur will saturate only one double bond, hexavalent sulphur in vulcanizing may saturate three double bonds belonging to rubber with which it is in contact and during its polymerization, which M. Dubosc explains thus: (1) In the case of an aggregate of rubber molecules, the end molecules, which have a double bond, will be broken and give a molecule of rubber of which the four valences will be saturated. The aggregate will have its polymerization increased by one molecule and its resistance to break will be modified in a slight degree only. (2) In the case of vulcanization with hexavalent sulphur, saturation of the terminal free valences of three physical aggregates of rubber will take place. Polymerization will therefore be three times as great as that produced with ordinary vulcanizations, because it acts on three aggregates instead of one. Resistance to break, dependent on polymerization, will therefore be much increased and its theoretical tripling has been demonstrated experimentally. This theory would appear to apply not only to the amino (NH<sub>2</sub>) or imino (NH) groups, but also to the nitroso compounds discovered by Peachey. Nitroso bodies decompose during vulcanization and generate cyanic acid. The latter, influenced by sulphur, yields sulphurous anhydride and sulphocyanic acid. The acid dissociates and leaves hexavalent sulphur, and the liberated cyanhydric acid again functions as a catalyser.

The most important organic catalysts are: (1) Aniline, extensively employed to quicken the combining of rubber and sulphur in vulcanization, particularly in the manufacture of tires and tubes, and obtained through a series of chemical transformations from coal-tar. It is an oily liquid boiling at 184-85° C. Special precautions are taken to carry off its noxious fumes and prevent contact of the oil with the skin of the workers. (2) Carbon bisulphide with aniline, diphenylthiourea or thiocarbamide, melting at 154° C., used for quick-curing stocks. (3) Carbon bisulphide with dimethylamine; effects vulcanization within 15 minutes at 135° C. (4) Carbon bisulphide with either dimethylamine, tetrahydropryrole or dimethyl X methyl trimethylene amine. (5) Ammonium borate; effective but not practicable. (6) Aldehyde ammonia; melts between 70 and 80° C.; a very useful catalyst. (7) Quaternary ammonium bases; patented, rapid accelerators with aldehyde ammonia, para-phenylene-diamine, sodium amide, benzylamine and naphthylendiamine. (8) Accelerene; widely used and powerful English catalyst. Used in one-third to one-half of 1% reduces vulcanizing period to one-third of normal, and with quick repair compounds to one-eighth. It owes its activity to the presence of the nitroso group and adds notably to tensile strength of goods. (9) Para-phenylene-diamine; a very poisonous catalyst melting at 140° C., and subliming at 267° C., used with synthetic rubber. (10) Tetramethylenediamine; a substance formed from decomposing animal matter such as fish; called also putrescine. (11) Hexamethylene-tetramine; known also as hexamethylenamine and formalin; an accelerator largely used; caution is required in its use as it is not only very soluble in water but vaporizes freely, irritating the exposed skin of the workmen. (12) Piperidine or aminopentane; a liquid easily miscible in water, boiling

at 105-7° C. and smelling like pepper and ammonia. A prototype of the more recently discovered organic catalysers, it was brought out in 1912 for use in making synthetic rubber, but was soon found to be of remarkable value for vulcanizing hard and soft natural rubber, cutting down the curing time three-fourths. (13) Methyl piperidine: an active catalyser boiling at 107° C. (14) Quinoline: a good accelerator, boiling at 240° C. and with a strong, disagreeable odour; little used. (15) Quinoline sulphate: a catalyser yielding good-looking, well-vulcanized rubber. (16) Hydroxy-quinoline: regarded as a valuable accelerator. It melts at 76° C., boils at 266-6° C., and is soluble in alcohol and volatile with steam. (17) Quinisol: a catalyser of special value to users of litharge, such as rubber-footwear manufacturers. It cuts the vulcanizing period one-half. (18) Oxiquinoline and oxiquinoline sulphonic acid; the latter gives good acceleration but porous rubber. (19) Oxiquinoline sulphide: a catalyser that can be used in practically every kind of vulcanizing; regarded by some as too rapid. (20) Anthraquinone: a catalyser used in batches containing rubber substitutes and cutting curing-time three-fourths. (21) Antipyrine and (22) naphthylamine; act like anthraquinone. (23) Urea formalilide, (24) thioformalilide and (25) guanidine are useful catalysers.

**The Manufacture of Rubber Goods.**—The manufacture of rubber goods begins with the tearing of the rubber into shreds, passing it between corrugated rolls and washing out the impurities. A stream of water flowing over the rolls carries off a large part of the dirt, while the rolls flatten the rubber into a thin sheet. The sheets require drying, after which they are ready for mixing with sulphur and other substances into what are called compounds. Compounding is done either on a machine called a masticator or in a mixing mill which kneads the mass until it is homogeneous. The rubber is next run into sheets, cut into various shapes, built up over forms and lastly baked or vulcanized. Hard rubber is handled in much the same manner except that after vulcanization it may be turned, shaped, buffed and polished. A list of the uses to which rubber is put would, if complete to-day, be only partial to-morrow. The main lines of its use may be briefly indicated as follows:—mechanical rubber goods; pneumatic and solid tires (see *TIRES*); moulded work; druggists' and stationers' sundries; dental and stamp rubbers; surface clothing; carriage cloth; mackintoshes and proofing; boots and shoes; insulated wire; hard rubber; cements; notions; plasters. Such a list, not of articles manufactured but of special lines, some of which include hundreds and even thousands of different articles, is sufficient to indicate the great variety of uses to which rubber is put.

In the period 1910-20 not only was progress shown in such chemical discoveries as catalysers but the mechanics of rubber manufacture was revolutionized. For example, for many years rubber, after being cleaned by washing, was dried in airy lofts, often hanging for a year to "age." With the growth of the business came hot dryers, bringing the drying-period down to weeks and sometimes days. Eventually the vacuum dryer came into use and a few hours sufficed to extract the moisture. More than 250 fillers and compounding materials are used in rubber manufacture. Their purpose is chiefly to enhance or supplement certain qualities in which rubber may be lacking. For example, powdered asbestos in quantity makes a compound that is heat-resisting, as in packings and brake linings. Most of the above materials have been known for years. The successful use of organic plastics such as glue is of recent accomplishment, as is the preparation of elaterite in plastic form, known as mineral rubber and largely used.

**The Pressure Cure.**—From the time of Goodyear, rubber footwear was vulcanized by the dry heat cure, that is, in closed rooms filled with hot air. This was very slow, entailing some seven hours of heating. Furthermore, only rubber containing a considerable amount of litharge could be used for this type of cure. The colour was always black, and variety in compounding and stocks was impossible. The discovery of the pressure cure by Augustus O. Bourn, of Providence, R.I., in 1901, however, practically revolutionized the business. In this process the goods were confined in large boiler-shaped shells. These were filled with hot air under pressure and the air from the inner surfaces removed by a vacuum process, the result being that vulcanization was hastened and a great variety of tough compounds, as for example those used in tire treads, were at once available. Rubber and fibre soles are coming in again, with a far better product. This is a compound of rubber and finely shredded cotton fibre. It is superior to leather in waterproof

qualities and in wear. It finds a large market in medium-grade footwear but has not been accepted by makers of the best grades of leather shoes. To a large degree the rubber heel has also displaced leather in medium-grade footwear.

**Balloon Compounds.**—With the interest in pilot and dirigible balloons stimulated by the World War, came marked progress in rubber compounds used in their manufacture. Of these the most notable were cements of vastly increased tenacity; ingredients and surface coatings that remained unaffected by the sun's rays, and compounds practically impermeable to gases and inflation. As a successful application of the last-named may be cited the gas-proof masks evolved by rubber chemists, that effectually protect the wearer from poison gas and have a wide field of use in many of the perilous industries of peace. Bathing suits and bathing caps of rubber, beautiful in texture, colours and ornamentation, are recent accomplishments. This is due to the production by chemists of colours unaffected by heat and sulphur. Rubber fills a large place in sports, but most of the goods supplied have been familiar for decades. An exceptional and novel use is rubber thread in golf-ball manufacture. The standard ball was for years made of solid gutta. In 1898 Coburn Haskell of Cleveland, O., invented a golf ball with a small ball of rubber as a core around which was wound rubber thread under tension. Outside of this was moulded a thin cover of gutta percha. The ball because of its long flight soon took the place of the "guttie" and helped enormously to popularize golf.

**Hard Rubber.**—Electric batteries employed in motor cars for lighting and starting and for a host of commercial uses resulted in a great demand for hard-rubber battery jars. Formerly made by a slow hand process, the invention of building and moulding machines greatly added to the quality of the product and the ability to meet the trade demands. The production of hard-rubber bowling balls, better than the lignum vitae, and of aeroplane propellers, better than laminated wood, points the way to the use of hard-rubber lumber, as nearly all the fine hardwoods are successfully imitated.

**AUTHORITIES.**—T. Seeligman, G. Lamy Torrilhon and H. Falconnet, *India Rubber and Gutta Percha* (1910); Philip Schidrowitz, *Rubber* (1911); A. Dubosc and A. Luttringer, *Rubber, its Chemistry* (1918); Henry C. Pearson, *Crude Rubber* (1918). (H. C. P.)

**RUCKER, SIR ARTHUR** (1848-1915), English physicist, was born at Clapham Oct. 23 1848. Educated at Clapham grammar school and Brasenose College, Oxford, he became professor of mathematics and physics at the Yorkshire College, Leeds, in 1874 and professor of physics at the Royal College of Science in 1886. This post he held until 1901, when he became principal of the university of London. He received the Royal medal of the Royal Society in 1891, was one of its secretaries from 1896 to 1901, and was knighted in 1902. He died at Newbury, Berks, Nov. 1 1915.

**RUFFEY, PIERRE XAVIER EMMANUEL** (1851- ), French general, was born at Dijon (Côte d'Or) on March 19 1851. He entered the École Polytechnique in 1871 and two years later was appointed *sous-lieutenant* in the artillery. He became a lieutenant in 1875 and a captain in 1878. In 1879 he went through the staff course at the École de Guerre, to which he later returned as professor of artillery. He was promoted major in 1891, lieutenant-colonel in 1897 and colonel in 1901. He served with the expedition to Madagascar, and in 1905 was made a general of brigade. In 1910 he was promoted general of division and in 1913 he was made a commander in the Legion of Honour. On the outbreak of war in Aug. 1914 he commanded the III. Army, but a month later, after the Longwy battles, he was removed from the command of his army, being succeeded by Sarraill. Thereafter he was not employed in an active command at the front, and in Jan. 1917, having already attained the age of retirement, he ceased to hold any appointment. General Ruffey, during the last years before the World War, had persistently advocated the increased employment of heavy artillery with the field army, and it was perhaps due to him more than to any other leading personality that the French Army was able to adapt itself so readily to the use of the new arm.

**RUMANIA** (see 23.825).—Before 1913 Rumania had an area of about 50,702 sq. m.; and by the treaty of Bucharest (Aug. 7 1913) it received from Bulgaria an addition of 2,969 sq. m. in the Dobrudja, which formed the departments of Durosthor and Caliacra. By the treaties following the World War, this area was more than doubled, the additions consisting of the Banat (11,000 sq. m.), Bessarabia (17,146 sq. m.), Bukovina (4,030 sq. m.), Crisana (8,038 sq. m.), Maramuresh (6,258 sq. m.) and Transylvania (22,312 sq. m.), making the total area of the kingdom 122,282 sq. miles. Thus during the period 1910–21 Rumania, from being slightly smaller than England, became somewhat larger than the whole British Isles. In shape Rumania is nearly circular, with a perimeter of about 1,850 miles. The Carpathians and Transylvanian Alps, which formerly separated Rumania from Austria-Hungary, run in a sickle-shaped curve from near Mt. Pietros to the Iron Gates, and almost down the centre of the country, which takes in the Transylvanian plateau and extends westwards into the Hungarian plain. Bessarabia forms a continuation of the plain of old Rumania. The territory corresponds roughly to the ancient Dacia, and the new Rumania constitutes a satisfactory ethnological unit, while its physical boundaries are, except in some parts, more defined by natural features than would appear from small-scale maps.

**Population.**—The Rumanian people form the great majority of the population, which was estimated in 1920 at 17½ millions, males being about 100,000 in excess. Apart from the alien elements of mediæval or earlier origin many foreign stocks are represented in the territories which form new Rumania, and throughout the 19th century Jews driven from Poland penetrated far into the country, particularly into Moldavian towns. But no one of these heterogeneous elements numbers one-tenth of the population, and the very high rate of natural increase among the Rumanians, the common use of the Rumanian language and the wide toleration which prevails in matters of religion, all tend to unification.

The National Orthodox Church had in 1918 a membership of over 9½ millions, and the Greek Catholic, Roman Catholic and Protestant churches each nearly 1½ million. Jews numbered about 830,000, Mahommedans 44,000 and Armenians 17,000.

The chief towns are Bucharest, the capital (estimated pop. in 1919 400,000), Jassy (80,000), Galatz (60,000), Braila (60,000), Kolozsvár (60,000), Ploesci (50,000), Craiova (46,000). Kishinev, the capital of Bessarabia, has a pop. estimated at 125,000.

**Government and Administration.**—The Senate consisted in 1920 of 170 members, of whom 82 represented the old kingdom, 45 Transylvania, 24 Bessarabia and 19 Bukovina. The Chamber of Deputies had 347 members; old kingdom 168, Transylvania 112, Bessarabia 51 and Bukovina 16. The Constituent Assembly elected in May 1920 was charged with the adjustment of the constitutions of the old kingdom, Transylvania, Bessarabia and Bukovina. In the elections of June 1920 the returns of parties were:—People's party 215, Federal Democrats 34, Bessarabian Peasants 25, Transylvanian Nationalists 21, Socialists 19, Independent Democrats 6, others 12.

For administrative purposes Rumania is divided into 735 districts and 129 urban and 5,735 rural communes.

**Education.**—Education continued to make progress although a large proportion of the population was still illiterate and compulsory school attendance was difficult to enforce. There were in 1920 19,374 schools with 1,612,763 pupils. Universities were founded at Cluj (Kolozsvár) in 1919 and at Cernaúti (Czernowitz) in 1920.

**Finance.**—The national debt of Rumania at the outbreak of the World War amounted to 2,086,008,329 lei. This increased during the war to 2,910,012,500 lei and subsequent increases brought the total to 11,148,408,330 lei as on April 1 1920, of which 3,986,008,330 was funded and 7,162,400,000 lei unfunded debt. To this was to be added about 10,000 million lei as Rumania's share in the national debts of the states added to her territory by the various treaties of peace, and at least 5,000 million lei required for the withdrawal of Austrian kronen and Russian rubles. The deficits of the war years were largely covered by a "National" loan (1916), a "Unirea" loan (1919) and Banque Nationale loans, and a loan against Treasury Bonds. The revenue and expenditure for the financial year 1919–20 were respectively 1,140 million lei and 4,127 million lei. About one-third of the revenue is obtained from indirect taxes and one-third from State monopolies and public services.

There were in 1919 notes of the National Bank of Rumania amounting to about 4,431 million lei, notes of the General Bank of Rumania (issued by the Germans) 2,172 million lei, more than 8,000 million Austrian kronen and about 1,000 million Russian rubles. When the krone and ruble are replaced by Rumanian notes the equivalent paper circulation may be taken at 11,500 million lei. The National Bank had in gold 315 million lei in Moscow, 80 million in Berlin and 98 million in the Bank of England; adding to this drafts and other interest-bearing resources abroad, the guarantee of the notes was nearly 34% a high percentage compared with the notes of most banks of issue in other countries.

**Agriculture.**—Four-fifths of the population of Rumania are engaged in agriculture. About 40% of the land under cultivation consists of holdings under 25 ac. and 50% of farms of 250 ac. or more. Far-reaching measures of agrarian reform were begun in 1917, and large areas had in 1921 been expropriated and transferred to the peasants. Of the 34 million acres which made up Rumania after the Peace of Bucharest in 1913 (2 millions of which consisted of rivers or lakes) about 12½ million acres were under cereals; 500,000 under pulse, vegetables and various industrial plants; 400,000 were vineyards and orchards; pastures covered nearly 3 million acres and nearly 1½ million acres were meadowland. Wheat and maize are the principal crops, the former being produced chiefly for export and the latter for home consumption. Maize is the characteristic crop of the small holder in the hill regions, while most of the wheat is produced in the larger farms in the plains. The methods of agriculture are in many parts still very backward; by the development of irrigation in the plains and the abandonment of the fallow system, production could be largely increased. Table I shows the area under cultivation and the production (in tons) of the principal crops in the years 1914, 1915, 1919 and 1920.

TABLE I.

Area and Production of the Principal Crops.								
	1914		1915		1919		1920	
	Acres (thousand).	Tons (thousand).	Acres (thousand).	Tons (thousand).	Acres (thousand).	Tons (thousand).	Acres (thousand).	Tons (thousand).
Wheat . . .	5,216	1,248	4,703	2,408	2,949	1,320	2,096	630
Maize . . .	5,092	2,701	5,205	2,743	4,838	2,597	4,051	1,773
Oats . . .	1,056	367	1,064	373	594	207	171	423
Barley . . .	1,404	644	1,371	758	584	257	1,054	460
Rye . . .	208	49	188	75	218	87	184	52

The cultivation of industrial plants is little developed. The vineyards produce in good years as much as 66 million gallons of wine. Plum trees take the place of the fig tree in Mediterranean countries. The tobacco and beetroot produced barely suffice for local needs.

The number of domestic animals was greatly reduced during the war: in 1920 it was estimated that in the new Rumania there were less than 5 million cattle and 11 million sheep. The breeding of horses was again becoming important, particularly in the Banat and the Nistru (Dniester) valley.

**Forests.**—Rumania has nearly 19 million acres of forest, of which 6½ millions are in old Rumania, 5½ millions in Transylvania, 1½ millions in Maramuresh and 1½ millions in the Banat. A great deal of timber is required locally for building and there is a considerable export from Platra and Galatz, but the development of the immense timber reserves had only made a beginning before the war.

**Minerals.**—The useful minerals occur chiefly in the hill districts; petroleum is by far the most important. The production of petroleum amounted in 1914 to over 13 million tons, placing Rumania fourth in the list of the world's oil-fields. Oil has been chiefly obtained in the region between the Ialomita and the Bistritza, the main wells being in the districts of Prahova, Dambovitza, Buzeu and Bacau and especially in Prahova; but there are strong indications that the fields are much more extensive. A line of three pipes from the oil-fields to Constantza, carried over the Danube by the Cernavoda bridge, was completed shortly before the war. The wells and oil refineries were wrecked by a British mission in Oct. and Nov. 1916 to prevent their falling into enemy hands, but during the occupation they were largely restored and a new pipe-line was laid through Bucharest to Giurgovo on the Danube. The production was 517,500 tons in 1917, 1,214,000 tons in 1918, and 920,000 tons in 1919. Considerable importance is attached to discoveries of natural gas, of which it was estimated in 1920 that the annual available supply is 2,500 million cubic feet.

Salt, which is a Government monopoly, is mined at Targu Ocna, Ocnele Mari and Slanic.

About 4 million tons of lignite are produced annually, chiefly in the region between the Danubius and the Ialomita. Small quantities of coal (less than 400,000 tons in all annually) are mined near Oravitz in the Banat. The exploitation of iron (400,000 tons annually), copper, lead and manganese has been begun. The gold mines in the Aranyos valley are the most productive in Europe.

**Manufactures.**—The development of manufactures in Rumania scarcely began before the 20th century. The chief industries are

petroleum refining, sugar manufacture, flour milling and saw milling. Bucharest, Braila and Galatz are the most important centres. In 1915 there were 1,149 industrial establishments employing 58,871 workmen and having invested capital of 805,472,618 lei. It has been estimated that water-power amounting to 150,000 H.P. is available, but in 1912 less than 9,000 H.P. had been brought into use.

*Imports and Exports.*—The total imports and exports for the years 1911-5 and 1919 are given in Table 2.

TABLE 2.

	Imports and Exports (000's omitted).					
	1911	1912	1913	1914	1915	1919
Imports	22,790	25,516	23,601	19,970	13,186	143,318
Exports	27,669	25,684	26,828	17,897	22,581	4,116

Before the war exports were chiefly to Belgium and Holland, and cereals formed the most important articles. In 1919 more than half the value of exports was made up by petroleum. Of imports in 1911 29% in quantity and 15% in value came from the United Kingdom, 25% and 24% respectively from Austria and 10% and 32% from Germany. The chief imports in 1919 were cereals and cereal by-products (220,149 tons; value 362 million lei) and manufactured articles. Exports to the United Kingdom were valued at £2,742,000 in 1919 and £3,227,000 in 1920, imports from the United Kingdom £5,585,085 in 1919 and £7,121,555 in 1920.

*Communications.*—Rumania had in 1913 2,586 m. of national roads, 3,066 m. of departmental roads, 22,000 m. of communal and village roads and about 7,000 m. of unmetalled tracks. The main roads are well constructed and maintained, but the communal and village roads are not well adapted for traffic and are often impassable at certain seasons.

By the Treaty of Versailles the Commission of the Danube is composed of representatives of France, Great Britain, Italy and Rumania alone. The Pruth, the only important waterway in Rumania besides the Danube, is navigable for ships of about 600 tons as far as Jassv. In 1919 Rumania had 158 merchant vessels aggregating 71,158 tons, including 17 steamers of 29,441 tons. The number of vessels entered at Rumanian ports in 1919 was 10,546, total tonnage 2,991,095 tons.

The railway system is inadequate. Four main lines of standard gauge radiate from Bucharest and a number of transverse lines cross the plains. The Carpathians are crossed at three points. There were 2,200 m. of line open in 1914 and 7,240 m. in 1920. The gauge of the Bessarabian railways differs from the others. Many new lines were in course of construction or were projected in 1921.

#### HISTORY, 1910-21

*The Balkan War.*—The war which broke out in the Balkan peninsula in 1912 as a consequence of the Italo-Turkish conflict and the Albanian risings demanded the anxious attention of the Rumanian government, now headed by J. Brătianu in place of Sturdza, whom ill-health had compelled to withdraw finally from political life. Rumania's official attitude towards the conflict of 1911 was strictly neutral, public sympathy being manifestly on the side of attacked Turkey. Towards the end of the year the Liberal ministry was obliged to resign. Rather surreptitious methods had been employed to pass a measure providing the church with a new constitution, which established a Supreme Consistory of the Protestant type, representatives of the priesthood sitting side by side with the bishops—this being the result of recent episcopal scandals of a private nature. The new convention with Austria-Hungary had sacrificed the vital interests of the Rumanian herdsmen of Transylvania, accustomed to feed their flocks and herds on the Rumanian slopes of the Carpathians and on the Wallachian plain. An endeavour had been made to regulate the internal distribution of petrol; and at the last moment the Minister of Finance, Costinescu, introduced a scheme for a progressive income tax, which was not adopted by the succeeding Liberal administration.

There were two candidates for the succession: on the one hand M. Take Ionescu, who, having left the Conservative party in consequence of a long-standing feud with the leader of its younger members, the rich landowner Nicolas Filipescu, had then formed a Conservative-Democratic party, which the longing of all classes for a new era had rendered remarkably successful at by-elections, on the other P. P. Carp, whom the death of G. Cantacuzène had placed at the head of the Conservative party. Promising a long programme of reforms, including an administrative transformation (the districts to be merged in "regions" of greater size administered by captains), it was the latter who

obtained the King's call to office. Among his colleagues were T. Maiorescu, N. Filipescu, and one of the country's foremost writers and orators, the lawyer B. St. Delavrancea.

The new Government far from satisfied the hopes of the public. The Minister of the Interior, Alexander Marghiloman, long regarded by Carp as his future successor, was chiefly preoccupied with assuring his party, despite its unpopularity, of a majority at the polls. To this end no pains were spared. Directly Parliament met, a virulent campaign was opened against the Liberals, beginning with an attack on their new economic policy (inspired chiefly by Vintilă Brătianu, brother of the leader of the party), which aimed at combining the interests of private capital with those of communal and state capital in such great transport concerns as the electric tramways of Bucharest. The Liberal opposition, numerically small, left the Chamber, and combined with Take Ionescu in a furious campaign for the overthrow of the Government. At the same time J. J. Brătianu, influenced by the Socialists, and by a Bessarabian "Poporanist" (peasant party) who had gained a high position in the party, raised the long-abandoned question of universal suffrage, and definitely pledged himself to the considerably milder policy of a single electoral college, with, moreover, only literate electors—the intention seeming rather to be that of weakening the spirit of independence of the first and second electoral colleges, whose sympathies were tending towards new formations like the National Democrats. Efforts were made at the same time to retain the votes of the rural school-teachers.

The Carp Government did something to ameliorate conditions of life for the peasantry, and N. Filipescu strove to improve the army, which had received scant attention of late years. In the matter of the Rumanian ecclesiastical schism—a quarrel between the Bishop of Roman and the Metropolitan Primate Athanasius—both protagonists were persuaded to resign and quit the field.

It was at this moment that the Balkan Confederation went to war with Turkey, whose European possessions they intended to share among themselves. Not only had no support been sought from Rumania, but certain clauses provided for the event of war with both that country and Austria-Hungary. At the outset, in Nov. the Rumanian Government professed complete unconcern with what was happening beyond the Danube. The rapid successes of the allies, however, and above all the Bulgarian victories of Kirk Kilissé and Lule Burgas, opened the eyes of neutral spectators to the danger of a new imperialism in the Balkans. From Austria-Hungary came formal proposals of military collaboration, in order to prevent the victors from realizing the expected profits of their astounding success, and General Conrad von Hotzendorff arrived at Bucharest, charged with this express mission.

But already the minds of a new generation, educated in the consciousness of a Rumanian moral unity which should necessarily produce practical results at the first great European upheaval, were totally opposed to the continuance of the policy inaugurated in 1884. After a visit from Francis Joseph himself to Bucharest in 1909, the Crown Prince Francis Ferdinand made his appearance at Sinaia, hoping to strengthen ties that were daily growing looser. The Hungarian Government, of which the Crown Prince pretended to disapprove, none the less pursued its denationalizing policy, imposing, with the full rigour of the Apponyi law, which monopolized nearly the whole of primary education with the study of Magyar, an examination in that official state language even on pupils belonging to Oriental religions or to the Greek church. The Emperor-King rejected the representations of the church of Sibiu on this subject. Political prosecutions, even of women, roused public feeling among the Rumanians of Transylvania. Efforts were made, under cover of seemingly democratic intentions, to turn against the Rumanians a project of Hungarian electoral reform then in preparation; and the electoral contests of June 1910 were of unusual brutality (*cf.* the present writer's pamphlets: *Les Hongrois et la nationalité roumaine en 1909* and *Les dernières élections en Hongrie et les Roumains*, Valenii-de-Munte, 1909-10). The idea of Rumanians marching shoulder to shoulder with the soldiers of

Hungary was received with almost general indignation (*cf.* the writer's pamphlet: *Les Roumains et le nouvel état de choses en Orient*, Vălenii-de-Munte, 1912). The necessity for a policy based on the existence of 13 million Rumanians, even though they inhabited three different countries, impressed public opinion more and more; and whatever may have been the Government's first intention, it began to realize its difficulties.

In the autumn the Bulgarian minister Danev, all-powerful at that moment, visited Rumania and offered to procure Bulgarian renunciation for ever of all claims to the Dobrudja—where, indeed, Bulgarians formed but a minority of the population—and also the modification of the frontier by flattening salient angles to the advantage of Rumania. His proposals were not accepted. "Compensation" was demanded for the huge territorial gains realized by the neighbouring state; and a formidable agitation for this broke out all over the country. M. Take Jonescu, with whom after the Court of Cassation's verdict in favour of the Tramway Co. an alliance had been made in a new ministerial grouping, with Maiorescu as president of Council, went to London to promote an arrangement, but was unsuccessful. The case was submitted to the Conference of St. Petersburg, which assigned Silistra to Rumania (April).

The mere delimitation of this territory raised many difficulties; and soon after the discussions between the Bulgarians and their allies, the question presented itself anew in different conditions. At that moment Carp, supported by Filipescu, was conducting a violent campaign against the Government, which had "lowered the dignity of Rumania," of which Silistra would even be "the tomb." The Government was called upon either to resign or to declare war on Bulgaria. Maiorescu obtained a parliamentary victory in the debate on the convention of St. Petersburg. But when the Serbians were treacherously attacked by the Bulgarians, and Bulgarian schemes for a Balkan hegemony became obvious, the idea of military intervention beyond the Danube had to be accepted. Russia, whose representative at Bucharest, Chehekov, manifested Rumanian sympathies, advised in that sense, Serbia just then enjoying the support of the Russian Cabinet. In June the Rumanian army, 500,000 strong, crossed the frontier, occupying on one side the Southern Dobrudja as far as Kavarna; and on the other side advancing, in an irresistible rush upon Sofia by Vratsa and Orhanie. The exhausted Bulgarian soldiers deserted *en masse* and the Rumanians sent them back to their homes.

As the Rumanian troops, commanded by the Crown Prince, drew near the Bulgarian capital, the Tsar Ferdinand despatched a telegram to King Charles asking for peace. Negotiations were immediately begun at Bucharest between Rumanians, Serbians, Greeks and Bulgarians. Peace was concluded in August: as regards Rumania, she obtained the territory which she had already occupied in the Dobrudja; and, furthermore, her rights of protection over the Rumanians in Macedonia were recognized.

*Question of Rumanians in Macedonia.*—In that region, isolated from the national soil, all through the Middle Ages sturdy local Rumanian communities had persisted, with forms of autonomy respected by the Turkish Government. Besides the shepherds, whose flocks covered the plateaux of the Pindus (see Wace and Thomson, *The Nomads of the Balkans*, London, 1913), there was an industrious urban population of artisans and traders, who spread, moreover, into towns in other parts of the Balkan peninsula. Later the activity of these "Koutzovlaks" turned towards Austria, and their colonies advanced from Budapest, Vienna, and Trieste to London and even to Philadelphia. Meeting with the Rumanian intellectuals of Hungary they initiated a new national programme, and in 1830 revived the ancient relations with Bucharest. The Rumania of Charles I. not only welcomed them as brothers, but created, chiefly through the wise agency of their leader, the Apostol Mărgărit, a complete system of Rumanian education in Macedonia, including a *lycée* at Monastir, and a commercial school at Salonika. The Porte was persuaded to differentiate the Rumanian communities of that region from the Greeks of the patriarchal organization, and from the Bulgarians of the Exarchy residing at Constantinople.

There lacked but one element, absolutely essential (granted the local conditions), namely the national bishop. He had been promised to the Rumanian faithful by the Treaty of Bucharest; but the clause had never been applied, as much through the Rumanian Government's own negligence as through the ill-will of the new Serbian and Greek masters of the situation.

Germany hailed Rumania's success as a means of retrieving through her ally that influence which the defeat of her *protégés* the Turks had caused her to lose in the East. As to Austria-Hungary, the imperial and royal minister at Bucharest, Prince Fürstenberg, presented a note from Count Berchtold in which the recently concluded treaty was referred to as a simple "preliminary arrangement." This conception was energetically rejected, and the scheme for a European congress to arrange Oriental affairs "definitely" was wrecked. But it did not prevent the Tsar Ferdinand from issuing to his army an order of the day in which, speaking of "spoliation," he indicated "better days of glory" as yet to come.

*Rumania during the World War.*—The World War was now brewing. In the month of June 1914, under the form of a pilgrimage to universities, Turkish intellectuals came to Rumania to make soundings with a view to reconciliation with Bulgaria. One month later Austria-Hungary declared war with Serbia, on the pretext of avenging the murder of the Crown Prince and his wife at Serajevo by a Serbian. The treaty with the Triple Alliance had only just been confirmed by the minister Maiorescu. His successor, the head of the Liberal party, who had come to power with a long programme of reforms—foremost among them an agrarian law based on the expropriation of the large landowners, and an electoral law establishing universal suffrage with the exclusion of illiterates—had never shown any intention of abandoning the foreign policy identified with King Charles' views and sympathies. Vienna felt assured that the Rumanian army, long prepared to that end, would march at her orders. The King's interview with the Tsar of Russia at Constantza, though it had caused a profound sensation in the country, raising hopes of a change of orientation, had produced no diplomatic results.

Public opinion was violently hostile to the Austrian adventure. During the Bulgarian campaign the soldiers had clamoured to be led to Transylvania; the King himself had witnessed their manifestations. In face of Italy's disclaimer of her obligations under the treaty, and England's declaration of war against the Central Powers, Charles I. and his advisers were forced to adopt the compromise of an armed neutrality, which the king hoped to break on the first opportunity.

When the German march on Paris failed, Rumanian politicians had to reconsider their position. M. Take Jonescu passed from the first idea of "loyal neutrality" to that of intervention on the side of the Allies, and in this he was supported especially by the combative energy of Filipescu. The latter did not shrink from dividing his own party, opposing Marghiloman, whose traditional Junimism favoured the Central Powers; and joining hands with his former rival, he effected a fusion with Take Jonescu. Meanwhile, popular demonstrations continued against Austria-Hungary and Germany, who by means of conventions were exploiting Rumania to feed the population of the German Empire, and whose subventioned Rumanian press was generally despised, despite the assistance given it by Carp and a few of his personal friends. At the "Lemberg moment" (the invasion of Galicia by the Russians), Filipescu had vehemently demanded rupture with Austria-Hungary.

In Sept. J. J. Brătianu succeeded in obtaining a declaration from the Allies (including the much-feared Russia) that in exchange for a benevolent neutrality Rumania should have the right to occupy those Austro-Hungarian territories which belonged to her by virtue of nationality. The sudden death on Oct. 10 of King Charles, to the last irreconcilable to a change of policy, facilitated the task of those who desired it. The sufferings of the Rumanians of Transylvania, induced to serve in the army of the Emperor-King by the lie that Rumania herself had embraced the same cause, and that her soldiers were fighting in

Galicia, together with the humiliations imposed on their religious and political leaders, increased the indignation provoked from the first by the conduct of the Germans in Belgium and invaded France. Soon after the Russian retreat from the Bukovina, moreover, rumours began to spread about the man-hunts organized by Austrian gendarmes against Rumanian "traitors."

The head of the Government, knowing the inadequacy of the military preparation and the difficulty of completing it, thought best to delay yet longer. Meanwhile Count Czernin, Austro-Hungarian representative at Bucharest, spoke to the Crown Prince Ferdinand (married to Princess Marie of Edinburgh, whose sympathies were well known, and whose political attitude and charitable activities were equally admirable) about the "miserable treachery" of Rumania if she abandoned her allies (*Diplomatische Aktenstücke betreffend die Beziehungen Oesterreich-Ungarns zu Rumänien in der Zeit vom 22 Juli 1914 bis 27 August 1916*, Vienna, 1916). The irresistible trend of public opinion was pointed out to him in reply. In Parliament discussion was forbidden on the burning question of relations with the belligerent powers. Troops concentrated in view of possible events were now partially demobilized. And on the side of Austria all that was done was to offer the Rumanians of Transylvania, through the Orthodox Archbishop, "a certain consideration for the wishes of our non-Magyar fellow-citizens relative to the church-schools," and "the admission of the maternal language in direct communication with the authorities," and "modifications of certain dispositions of the electoral law."

As Rumania refused to allow the passage of munitions for Turkey, whose capital was now menaced by the attack in the Bosphorus, war on Serbia began anew in 1915. The Brătianu Government, which continued negotiations about the frontiers of the Bukovina, claiming to receive back the province precisely as Austria had taken it in 1775, and also about the frontiers of the Banat, where owing to Serbian colonization in the western districts there was no decisive preponderance of Germans and Rumanians, once more managed to hold public impatience in check. Henceforward, all the Central Powers could exact from Rumania was the passing of measures necessary for provisioning their populations. Italy's declaration of war in May 1915 served to raise still higher the popular excitement, which was now clamouring for a prompt decision in the only possible sense.

But when the offensive of General Brussilov once more reached Galicia and the Bukovina, further delay was impossible, especially as now, in the month of July, the treaty assuring Rumania of the desired territorial limits had just been signed. Russia became urgent: the Rumanian Cabinet was warned that delay would cause the cancelling of the territorial engagements. Certain illusions had been cherished with regard to Bulgaria, whose Prime Minister Radoslavov had formerly declared in Nov. 1894 that his country was "ready to give all the guarantees which should eventually be desired that she would not attack Rumania if the latter should take part in the general war." Now, however, Russia, who undertook to unite with the Rumanian forces when they entered Transylvania, and to march in concert upon Budapest, was asked to send into the Dobruja troops sufficient to supervise the somewhat mistrusted neighbour who had participated with such zest in the annihilation of Serbia. Without having ever made one serious proposal, the German and Austrian ministers prepared to depart the moment Rumania's declaration of war arrived at Vienna (Aug. 28 1916).

As regards the internal political situation, the Liberal Government, which had achieved the entry into war unassociated with any of the opposition parties (for Majorescu, summoned to the palace on the eve of the declaration, had fancied he was going to be called to power in order to prevent the rupture), did not even call the Chambers together to obtain their approval of the step. The armies were swiftly crossing the mountains by all the passes, to unite and form one single front upon a diagonal line in the middle of Transylvania. The enemy's feeble forces were everywhere retreating; but Germany had soon moved in her ally's interests, and had declared war. Bulgarians armed and led by German officers now surprised at Turtucaia a badly organized

Rumanian army, forced it to capitulate, and advanced through unresisting Silistra into the Dobruja, which despite General Averescu's sturdy defensive was soon the prey of Marshal Mackensen; while in Transylvania itself General Falkenhayn was striking a decisive blow near Sibiu-Hermannstadt.

For the Rumanians nothing was left but the tragic duty of defending, with utterly inadequate technical preparation, their Carpathian frontier. This defensive they succeeded in prolonging until the end of Nov., when, served by the spies of the Austro-Hungarian companies for the exploitation of the forests, and favoured by exceptionally mild weather, they penetrated the valley of the Jiu, and occupying Craiova proceeded towards Bucharest, whose fortifications, constructed against the Russians in 1880 by the Belgian General Brialmont, had no longer any military value. After brilliant initial success a stand was made on the Argeş by advice of the French General Berthelot, but ended in defeat. The army retreated in disorder towards Moldavia to reorganize there, sheltered behind Russian troops who had at last arrived on this new theatre of war; king, ministers, and parliament were already in the ancient Moldavian capital of Jassy, where they had to remain until the end of 1918.

A counter-offensive, carefully prepared during 1917, had already begun, and in July had opened the path through Wallachia, when the Russian defection in Galicia and the subsequent push by Mackensen, who threw all the forces at his disposal upon the Sereth for an advance upon Odessa, brought upon the new Rumanian army the great disaster of Marasesti—a battle lasting ten days and ending in complete inability for further resistance. As the disintegration of the Russian army proceeded, yesterday's allies turning into pillaging bands dangerous to the whole life of the country, hostilities were perforce suspended; and eventually it became necessary to submit to the armistice imposed by the Germans on General Stcherbachev, who had assumed the chief command on the Rumanian front, passing over King Ferdinand's right to the supreme command. Rumania, nevertheless, parleyed yet another two months before entering into negotiations that could only mean the abandonment of her rights, the diminution of her pre-war territorial possessions, and the loss of her economic independence.

*Agrarian and Electoral Reforms.*—Ever since in Dec. 1916 the Parliament had met at Jassy and enthusiastically approved the prosecution of the war to a finish, Brătianu had shared the burden of power with Take Ionescu and his section of the Conservative party. (Filipescu had died at Bucharest before the *débâcle*.) The activities of the Coalition Ministry had naturally been limited to ordinary current affairs. But in April the agrarian question once more became urgent, owing in part to the reactions on the public mind of the triumph of the social revolution in Russia. (The chief of the Rumanian socialists, a Bulgarian named Rakovski, after having been kept for some time under arrest at Jassy, had managed to escape, and was now agitating with his followers against the king and the *bourgeoisie*.) Influenced by the Crown, the Conservatives at last accepted the radical policy of expropriation, to be applied to an area fixed at 2,000,000 hectares.

Parliament debated the project for two months, the result being a law promulgated in July 1917, which left the original proprietors 500 hectares at most for each separate estate (absentees being completely expropriated), and assigned them a compensation in State bonds, the amount not to exceed twenty times the annual value of the property. A scheme for the communal holding by village associations of the land thus obtained was rejected in favour of the traditional individual tenure. Details of the distribution were to be fixed by law; but now, under the menace of a German occupation even in Moldavia, members of parliament were dispersing. When the triumph of the Central Powers seemed certain, and the armistice foreshadowed an early peace, the leaders of the war-party were practically forced to flee the country. A number of them took refuge in Paris, where they formed a national Committee of Claims.

*Reunion of Bessarabia; Peace of Bucharest; Expulsion of Occupying Forces.*—Already, however, the depredation of the

Russian Bolsheviks had obliged the Rumanians of Bessarabia to form a Moldavian Republic; the ancient Rumanian spirit had quickly awakened, thanks in part to a group of young writers who had never ceased to cultivate spiritual relations with free Rumania. An attempt to form a local army having failed, appeal was made to the Rumanian troops, who had moreover an interest in defending the stores of food in Bessarabia. The union of the Principalities was celebrated in Feb. 1919 at Chishinau, capital of the province, as well as at Jassy; and on April 9 the *Sfatul Tarii* (Council of the country), formed on the model of all the other revolutionary assemblies of the former empire of the Tsars, was to proclaim the union of Bessarabia with the kingdom of Rumania. J. J. Brătianu had already resigned (Jan. 1918) in face of the equal impossibility of either organizing resistance or signing a treaty of abdication. General Averescu, charged with the negotiations because of his military prestige, went for this purpose to Butea near Bucharest, and found in the capital a party of violent opponents of the war led by the Germanophiles Carp and Stere. Count Czernin, irreconcilable in his attitude towards the Rumanians, rejected Germany's advice, brought him by von Kuhlmann, to concentrate solely on placing Rumania in a state of economic servitude, and proceeded to carve up in fantastic fashion the mountainous frontier of the kingdom; cutting off, moreover, the Dobrudja, whose future was to be settled between the Germans and the Bulgarians, Rumania being only left access to the sea under terms to be subsequently fixed. The Danube would become an artery for Austrian and German commerce, Vienna taking foothold at Severin, and Berlin at Giurgevo by means of "purchases" of wharves and sites on long leases. The entire export of the chief products of the country was assured to the Central Powers. Their army of occupation would have to remain for years to enforce the fulfillment of provisions, unexampled in severity, imposed on the country as expiation for its "crime."

This treaty was signed by the new Marghiloman Ministry, installed in office just after the arrival of a secret mission from the Emperor Charles acquiescing in the maintenance of the Rumanian dynasty. The king had been subjected to the extreme humiliation of having to go to a Moldavian railway station to meet Count Czernin, who had come there expressly to afford himself the satisfaction of that revenge.

The Marghiloman Ministry, whose chief certainly possessed statesmanlike qualities, struggled against insurmountable difficulties through months of unexampled suffering for the exploited and humiliated country. In the occupied territory everyone was snatching greedily at the remnants of national prosperity now in process of dispersal; the unlimited issue of paper money imposed on the country by the Austro-Germans through the Banque Générale presaged financial ruin; while economic ruin was ensured by the exportation of sheep and cattle, by the cutting down of forests, and by the dismantling of factories. The population, meanwhile, was starving, reduced to famine rations, and the morals of its working-class were being perverted by revolutionary propaganda. A Parliament elected under the pressure of enemy armies—a Parliament, moreover, composed of the worst elements of political life—often succeeded in disgusting even those who had desired to have it.

This state of things lasted until the battle-front of the Central Powers had been penetrated both on the Rhine and in the Balkans. The king then called to power General Coandă, an old soldier who had already had experience in diplomacy, together with General Grigorescu, to whom was due the chief credit for the victory of Marashti, as Minister of War. This Cabinet, without reference to Parliament, decreed a law for the expropriation of landowners, in accord with liberal ideas, and on the basis of the new constitutional text (the acts had been passed by the dissolved Marghiloman Parliament, the decisions of which had been declared null and void). But no sooner had the French troops commanded by General Berthelot arrived on the Danube, than the head of the Liberal party claimed, as initiator of a war due chiefly to pressure of public opinion, a change of Government in his favour. In a few days he entered Bucharest at

the side of the king, to inaugurate an administration which only lasted one year.

*Reunion of the Bukovina and of Transylvania.*—The new Liberal Government had the extraordinarily difficult task of reuniting, in one political whole, provinces which had been under the domination of different alien states. Bessarabia was already incorporated in the ancient kingdom, having completely abandoned the idea of autonomy, which had at first been supported by her leaders, Inculetz, Pelivan, and Halipa. Before the King's departure from Jassy he had received a deputation which came to offer him the Bukovina with the delimitation of 1775. Menaced by a Bolshevik agitation begun at Czernowitz by demobilized soldiers, this province had in Nov. proclaimed its reunion with the mother-country, under the inspiration of the historian, Prof. Jean Nistor, and of Jean Flandon, formerly head of the National party and of the Rumanian Political Union (his rival, Aurèle, chief of the Democrats, had compromised himself by projects for a great Austria, to include Rumania). The German immigrants, the few Poles, and the Jews had given their assent; only the Ruthenians held aloof, planted out as they had been by Austria and sedulously represented by statistical artifices as being the principal nationality in the Bukovina.

In Transylvania during the war the Magyar administration had spared no pains to reduce the number and importance of the Rumanians, over 3,000,000 in numbers, and predominant especially in the rural districts. The prisons were filled with suspects; judicial murders were the order of the day; a measure was framed to expropriate in favour of alien immigrants the widows and children of soldiers killed in action. At Bucharest the Bessarabian C. Stere performed the deplorable rôle of editing a journal which advocated the candidature of the new Emperor-King Charles to the throne of Rumania (Prince Joachim of Prussia had also been suggested). Directly Vienna and Budapest repudiated the Habsburgs and their followers, as being responsible for the defeat, a great Rumanian assembly at Alba Iulia declared (Dec. 1918) that Transylvania henceforth formed part of the kingdom of the united Rumanians, but that they promised absolute national liberty to their Saxon and Magyar fellow-citizens. The Saxons gave their adhesion immediately; but the Magyar bishops, Catholic, Calvinist, and Unitarian, did not take the oath of allegiance to King Ferdinand till 1921. A Council of Direction, presided over by Jules Maniu, took the reins, established order, and gave new national forms to Transylvanian life. The greater number of non-Rumanian officials were retained; communes kept their accustomed privileges; Magyar and Saxon schools worked unmolested side by side with Rumanian institutions both old and new.

*Latest Events: The Agrarian Question.*—During the few months of Liberal Government the reunited country awaited in vain its definitive constitution. The reconstruction of the devastated districts had to be attended to, and difficult diplomatic negotiations had to be conducted that should result in the recognition by the Allies of the new frontiers. Those fixed by the treaty of 1916 were drawn back in places to give the Hungarians a part of the hinterland of Oradea-Mare (Nagy-Várard, Gross-Wardein), and the Serbians a good half of the Banat—they had pressed to be given also the town of Temesvar (Temisova).

After the end of 1918 a Bolshevik Government had been in power at Budapest, Count Karolyi having resigned rather than acquiesce in the military convention which deprived Hungary of the provinces which she had conquered and held since the Middle Ages. This Government showed from the first its intention of serving the party of revenge, and of trying to restore the mediaeval kingdom. An armed attack on Rumanian territory by the greater part of the Red army led, in Aug. 1919, to a Rumanian counter-offensive, which—despite the interdiction of the Allies—arrived at Budapest in a few days; and there the Rumanians remained until the appointment of Admiral Horthy as regent. This was expected to promote the same policy of revenge by preparing the return of Charles of Habsburg.

The treaties of Versailles and of St. Germain recognized as Rumanian the territories which had belonged to the Dual Mon-

archy. Austria quickly signed what regarded her; but Hungary resisted till 1921, and then expressed her ratification in terms which left no doubt as to the sentiments animating a large part of the nation. Nevertheless, Rumania now considered it right and safe to demobilize (April 1921).

The Brătianu Government had resigned in order to avoid signing a treaty which imposed on the kingdom a system of minority rights that they would have preferred to establish by their own legislation. As a matter of fact, by two successive measures full political rights had already been granted to the Jewish population, without distinction between old inhabitants and recent immigrants; so that this "question" had finally ceased to exist.

For the first time the elections were free, under supervision of the "Ministry of Generals" presided over by Arthur Văitoianu. They resulted in a large majority for the Peasant party (whose chief was the rural school-teacher Jean Mihalachi) and the National Democrats; the Liberals now formed but a fifth part of the total number of deputies; the National party of Transylvania, the Peasant party of Bessarabia, and the National party of the Union of Bukovinians were united in their representation; a certain number of Socialists made their appearance in this first Parliament of united Rumania. The majority parties coalesced as a "*bloc parlementaire*," and in Nov. 1919 formed a democratic Government of advanced tendencies under presidency of the Transylvanian Alexander Vaida Voievod, who at once visited Paris and London and obtained the formal recognition of a Rumanian Bessarabia (this was confirmed by his successor at the Ministry of Foreign Affairs, Take Ionescu). Measures were elaborated for a definitive solution of the agrarian question (the Mihalachi scheme, leaving landowners only 100 hectares for each estate, but granting concessions to those who had farms and agricultural installations); for the reorganization of education and administration; and for remedying the shortage of housing accommodation (scheme of Dr. Lupu, Minister of the Interior). General Averescu, who in April 1917 had founded a "League of the People," demanding penalties against the abuses of the Liberals during the war, and who had developed this organization—which contained many Conservatives and some "new men"—into a party under his leadership, now came into power, thanks to the alarm aroused at Court and in society by the Bolshevik agitations. The Socialists had promised their support to the man of the moment; and soon after his advent to power (March 1920) General Averescu concluded a pact with Take Ionescu, though without admitting that statesman's "Democratic" party (entirely Conservative but for Marghiloman's "Progressists") to a share in the administration of the country.

There ensued a régime of relentless repression. The threat of a general strike provided an opportunity to try and to condemn by court-martial the leaders of the Communists, from whom the Social Democrats had detached themselves under the leadership of the Bukovinian Grigoriu. During the elections opponents were roughly treated. Few attempts were made to check the growing corruption of the towns. Important projects of law were hung up: that concerning the distribution of land was modified until it resembled the Mihalachi scheme in regard to the quota to be expropriated (and for the remainder, simple decrees at once put in force had, as in other cases, anticipated parliamentary decision). In March 1921 the Finance Minister, Nicolas Titulescu, having reduced to order the chaos of the Treasury Bonds, introduced a bill heavily taxing new fortunes and capital in general, while relieving the peasants and the small urban proprietors. It was hoped by this means to stabilize the national finances, and to restore the Rumanian exchange, which had fallen as low as 18 centimes in Paris. (N. J.)

**LITERATURE.**—The revival of Rumanian literature dates back to about the middle of the 19th century, when, owing chiefly to the awakened interest in Percy's *Reliques*, the poet Alexandri published his collection of *Folk Poems*. This, together with the *Old Chronicles*, edited by Kogălniceanu, constituted a living monument of the vernacular. Their importance as an inspir-

ing and stimulating power to the new writers was fully appreciated by Titu Maiorescu, who became the leading critical spirit in Rumanian letters. Under Maiorescu's influence a group of national writers gathered round the newly founded periodical *Convorbiri Literare*. Among them were J. Creangă, who in the *Recollections of Childhood* and other tales embodied the spirit of the Moldavian peasantry; Caragiale, who, besides a realistic drama and two volumes of short stories and sketches of unsurpassed craftsmanship, showed in his comedies *The Lost Letter* and *Stormy Night* the grotesque effect resulting from a hasty introduction of Western manners into a society still stamped with an Oriental character; and above all the poet Eminescu. The last-named, who has been compared with Leopardi, was dominated by a note of profound, penetrating, overwhelming sadness, which affected all his successors, not excepting Al. Vlahuța, a poet with a strong individuality of his own. But there is another side to Eminescu, his broad conception of the Rumanian race. It was this that impressed writers of the later generation such as Prof. Jorga, who, in his *History of Rumanian Literature*, arrived at a clearer understanding of what a national literature may be. In his own weekly, *Sămănătorul*, as well as in such other periodicals as *Convorbiri Literare* under the editorship of Prof. Mehedinți, *Luceafărul* and *Viata Românească*, was first published almost all the modern writing which reflects artistically the deeper characteristics of the Rumanian people. A corner of the humble life of Banat is described in Popovici-Banateanu's short story, *Out in the World*; the romantic Vlach population scattered throughout the mountainous parts of Macedonia, Epirus and Thessaly is represented in Marcu Beza's volume of short stories *On the Roads* and his novel *A Life*; Transylvania has produced the poets G. Cosbuc, Octavian Goga, and Stephen Josif. To the last-named, a Transylvanian of Vlach paternity, are due the best renderings into Rumanian of Shakespeare's *Midsummer Night's Dream* and Shelley's *To a Skylark*. Barbu Delavrancea has given to the theatre an historical trilogy. Victor Eftimiu's poetic excursion into fairyland, *String ye pearls!* is founded on a popular Rumanian folk tale. And among story-writers must be mentioned Bratescu-Voinesti, Diliu Zamfirescu, and Michael Sadoveanu. A great loss to Rumanian literature was the untimely death of the poet Cerna, who in profundity ranked next to Eminescu. (M. B.)

**RUNCIMAN, WALTER** (1870– ), British politician, was born at South Shields Nov. 19 1870, the son of Sir Walter Runciman, 1st Bart., a Newcastle ship-owner. He was educated at Trinity College, Cambridge, and afterwards joined his father in his shipping business, being from 1896 to 1905 managing director of the Moor line of cargo steamers. In 1898 he unsuccessfully contested Gravesend in the Liberal interest, but was elected for Oldham in 1899, although he only held the seat for a year. In 1902 he stood successfully for Dewsbury, and retained this seat until 1916. In 1905 he entered Sir Henry Campbell-Bannerman's Government as parliamentary secretary to the Local Government Board. He became financial secretary to the Treasury in 1907, president of the Board of Education in 1908, and was president of the Board of Agriculture from 1911 to 1914. From 1912 to 1914 he was also Commissioner of Woods and Forests, and from 1914 to 1916 president of the Board of Trade. On the formation of Mr. Lloyd George's Ministry in 1916 he retired from the Government.

**RUPPRECHT**, Crown Prince of Bavaria (1869– ), eldest son of King Louis III, was born May 18 1869 at Munich. In 1899 he visited India and in 1902–3 undertook a journey round the world, of which he gave some account in his *Reiseerinnerungen aus Ostasien* (1905). In 1906 he was appointed to the command of the I. Bavarian Army Corps. At the outbreak of the World War he was commander of the Bavarian troops (the VI. German Army) and led them to victory in the great battles fought in Lorraine (Aug. 20–22 1914). In the following Oct. he was placed in command on the German front in Artois and southern Flanders, and, after having been advanced to the rank of field-marshal, was entrusted in the spring of 1917 with the chief command of the Northern Group of Armies on the

western front. Prince Rupprecht's first wife, a daughter of Duke Karl Theodor of Bavaria and sister of the Queen of the Belgians, died in 1912. In 1918 he was betrothed to Princess Charlotte, afterwards Grand Duchess of Luxemburg, but at the end of the war the betrothal was annulled. Prince Rupprecht renounced his claims to the Bavarian throne at the time of his father's abdication (Nov. 1918), and in 1919 he offered to stand his trial before a Court of Justice for State Affairs, if such a court, as had been contemplated, were instituted. In a letter written in 1917, but published only in 1922 in the press, Prince Rupprecht declared his disapproval of the foreign and military policy of Germany during the World War, and expressed the well-founded opinion that it was doubtful whether the Hohenzollern dynasty would survive the war.

It may be noted that through his mother, the Archduchess Maria-Thérèse of Austria-Este, Prince Rupprecht is the descendant of the Stuarts and might, therefore, pose as the "legitimist" claimant of the British Throne.

**RUSSELL, BERTRAND ARTHUR WILLIAM** (1872– ), English mathematician and philosopher, second son of Viscount Amberley and grandson of the 1st Earl Russell, was born at Chesham May 18 1872. Educated at Trinity College, Cambridge, where he took a first-class both in the mathematical tripos and in the 2nd part of the moral sciences tripos, he remained at Cambridge as a lecturer, and became well known as a student of mathematical philosophy and a leading exponent of the views of the newer school of Realists. In June 1916, Mr. Russell, who had taken a strong line against the Government, and was a "conscientious objector," throughout the World War, was fined £100 and £10 costs for making statements calculated to prejudice recruiting, and, in consequence, Trinity College, Cambridge, deprived him of his lectureship. His chief published works, on which his philosophical reputation was based up to the outbreak of the World War, were *German Social Democracy* (1896); *Essay on the Foundations of Geometry* (1897); *Principles of Mathematics* (1903); *Principia Mathematica* (with A. N. Whitehead, 1910) and *Our Knowledge of the External World* (1914). Later he published *Principles of Social Reconstruction* (1917); *Mysticism and Logic* (1918); *The Analysis of Mind* (1920) and (after a visit to Russia) *The Theory and Practice of Bolshevism* (1920).

**RUSSELL, GEORGE WILLIAM** (1867– ), Irish writer and painter (best known under his sobriquet of "Æ"), was born in Lurgan, co. Armagh, Ireland, April 20 1867, the second son of Thomas Elias Russell. He went to Dublin with his parents in 1874, and was educated at Rathmines school. After some years spent in an accountant's office in Dublin he joined the Irish Agricultural Organization Society in 1897 and became an organizer of agricultural societies. In 1904 he became editor of the *Irish Homestead*, the organ of the agricultural cooperative movement in Ireland, a position he still held in 1921. He published his first book of verse, *Homeward: Songs by the Way*, in 1894. His second, *The Earth Breath*, was published in 1897. *Literary Ideals in Ireland*, some essays in collaboration with W. B. Yeats, W. Larmine and John Eglinton, appeared in 1899; and *Ideals in Ireland*, essays in collaboration with W. B. Yeats, Douglas Hyde, Standish O'Grady, D. P. Moran and Lady Gregory, appeared in 1901. *The Nuts of Knowledge*, a book of selections of his lyrics, was hand-printed in 1903. *The Divine Vision*, his third book of verse, appeared in 1904; *The Mask of Apollo*, a book of mystical tales, appeared in the same year; *New Poems* (edited, 1904); a hand-printed selection of his verse *By Still Waters* (1906); some *Irish Essays* (1906). *Deirdre*, a play in three acts, was published in 1907. *The Hero in Man*, an imaginative musing on the character of the soul, appeared in 1909; *The Renewal of Youth*, a similar meditation, in 1911. *Coöperation and Nationality and The Rural Community*, two pamphlets embodying cooperative ideals, were published respectively in 1912 and 1913. *Collected Poems* appeared in 1913, and *Gods of War* and other poems, privately printed, in 1915. *Imaginations and Reveries*, a book of prose essays, was published in 1915; *The National Being: Some Thoughts on an Irish Polity*

in 1917; *The Candle of Vision*, prose, in 1919. He was a member of the Irish Convention called in 1917, and his *Thoughts for a Convention*, now embodied in the 1921 edition of *Imaginations and Reveries*, appeared that year. As well as those mentioned he published from time to time pamphlets on various social and political subjects.

As a poet he ranks among the mystics, in the sense that his verse is dominated by a spiritual conception of the universe. Of the two great poets brought to light by the Irish literary revival, W. B. Yeats and "Æ," it might be said of Yeats that he coined for the world the treasure recovered by the renewed access to Gaelic sources into what was virtually a new language in poetry, and of "Æ" that he brought into Irish literature the ancient spiritual thought of the world. His gifts as a poet are reinforced by the vision of an artist, and though in verse he attained his highest expression, his paintings convey a vision of nature as intimate and delicate as in his verse.

He embodied his ideals for the cooperative movement and his thoughts for an Irish polity in *The National Being*. In this book cooperative ideals are used, in a fashion entirely novel, for the creation of a society which would be easily malleable to human impulse and yet stable. The foundations of his state do not begin in a legislature but in the parishes of the country, the social order taking precedence of the political order. He exhibits a general dread of the highly organized state, a dread which may be to some extent an Irish characteristic, and would make the pillars of his nation innumerable cooperative societies, each with the largest freedom for economic and social development, but federated together for enterprises which are too extensive for operation by a small community alone. He would like these communities to do many things which in other countries State departments are asked by socialists to undertake. His ideas on these matters had considerable effect upon the younger generation of Irishmen as well as upon the cooperative agricultural movement in Ireland, founded by Sir Horace Plunkett, and in which "Æ" had worked so many years. His *Candle of Vision* is a record of a personal psychological experience expressed in a luminous and distinguished prose. His economic writings in *The Irish Homestead* and elsewhere, his imaginative prose writings, his verse and his painting, exhibit a unity and harmony rare in one whose modes of expression are so diverse. This probably arises because all are inspired by a conception of God and man and Nature as one single yet multitudinous being, and out of this philosophical root comes the harmony of character maintained throughout in work in such varied spheres as painting, poetry, psychology, economics and politics. (S. L. M.)

**RUSSELL, ISRAEL COOK** (1852–1906), American geologist (see 23,862), died at Ann Arbor, Mich., May 1 1906.

**RUSSELL, SIR THOMAS WALLACE, 1ST BART.** (1841–1920), Irish politician, was born at Cupar, Fife, Feb. 28 1841. At the age of eighteen he went to Ireland and settled at Donaghmore, co. Tyrone, working as an assistant in a drapery shop. In 1864 he became secretary and parliamentary agent of the Irish temperance movement, and became well known as a speaker for that cause; it was largely due to his energy that the Irish Sunday Closing Act was passed in 1878. In 1885 he unsuccessfully contested Preston as a Liberal, but in the following year was elected to Parliament for S. Tyrone. The Home Rule controversy was then at its height, and Russell was one of the most determined opponents of Gladstone's measure. His valuable work for the Unionist cause led in 1895 to his appointment as parliamentary secretary to the Local Government Board, a post he held until the general election of 1900. About 1899, however, Russell's views underwent a change, and from this time he not only gave up his advocacy of the Unionist policy in Ireland, but became its unceasing and rather bitter critic. His book *Ireland and the Empire* (1901) was largely an attack on the Irish agrarian system, and he also expressed in it his distaste for the Ulster point of view in no measured terms. He became in 1902–3 a member of the Dublin Land Conference, presided over by Lord Dunraven, which ultimately led to the passing of Mr. George Wyndham's Land Purchase Act (1903). In 1907

Russell succeeded Sir Horace Plunkett as vice-president of the Irish Department of Agriculture and Technical Instruction. In 1910 he withdrew from the representation of S. Tyrone, but in the following year was elected for N. Tyrone as a Liberal and Home Ruler. He received a baronetcy in 1917 and retired from public life in 1918. He died at Terenure, co. Dublin, May 3 1920.

**RUSSELL, WILLIAM CLARK** (1844-1911), English author (see 23.865), died at Bath Nov. 8 1911.

**RUSSIA** (see 23.869).—The history of Russia in the years 1910-21 was dominated by the revolution. The connexion between the World War of 1914-8 and that crisis is evident, but even the years preceding the outbreak of the war, both at home and abroad, must be considered chiefly as leading up to the catastrophe. The decay of the bureaucratic system of government, the entanglements of the foreign policy of the empire, the spread of extreme theories among the educated classes, the misery and discontent of the common people, were manifested by striking symptoms both on great occasions and in everyday life.

*The Last Years of Tsardom*.—The transition from an autocratic to a constitutional régime is a difficult problem to solve under any circumstances, and it was rendered especially difficult in Russia by the lack of political education among the people, the doctrinaire fanaticism of the intellectual leaders and the shortsighted egotism of the Government. Instead of realizing the necessity of working together and supporting one another in order to avoid a revolutionary catastrophe, the traditional rulers and the reformers were intent on destroying each other. The First Duma had ended its days in a vain attempt to appeal to the country against the Imperial Government. In the face of terroristic attacks bureaucratic circles invited the support of enlightened public opinion, but they did it in a characteristic fashion. General Trepov conducted negotiations with a view to forming a Cadet Ministry, but competent observers were convinced that his ultimate object in applying to the advanced doctrinaires was to effect an unworkable coalition which would have to be given up after a short interval in favour of a military dictatorship (Isvolsky, *Memoirs*, 201f.).

The Stolypin Ministry, which was actually formed in 1906, started also with a programme of coöperation between the Government and "leaders of public opinion," and it sought an agreement with the more moderate sections of Liberals, especially with the Octobrists, the supporters of a policy aiming at putting into practice the Manifesto of Oct. 30. The failure of this attempt is a fact of historical importance in so far as it showed conclusively how irreconcilable the tendencies of the Imperial bureaucracy were with the programme of Moderate Liberalism. Our survey of the period must start with a brief account of Stolypin's policy, as its failure led directly to the events of the revolution which put an end to the monarchy of the Romanovs.

*Stolypin's Policy*.—The protagonist of the drama in 1906-10, P. A. Stolypin, was as fine a representative of Old Russia as the governing class of the time could muster—not a great statesman nor an original thinker, but a high-minded, patriotic country gentleman endowed with the traditional courage of his class, with practical experience in Zemstvo work and provincial administration, accessible to ideas of reform, but constitutionally adverse to radical theories. When Minister of the Interior in Goremykin's Ministry he had taken part in negotiations with the "leaders of public opinion," even with Cadets like Muromtsev and Milyukov; on assuming the premiership he tried to introduce into his Cabinet Liberals like Count Heyden, A. Guchkov, N. Lvov, but he did not insist on this combination and eventually formed his Ministry on bureaucratic lines, while relying on the support of the Moderates in the Duma.

The sanguinary repression of revolutionary attempts and of agrarian revolts was taken in hand with ruthless energy, and it succeeded in driving discontent underground and in reestablishing external order, but it cast its shadow on the constructive work of Stolypin's statesmanship. After the clash with the intractable Second Duma the electoral system was altered by the Manifesto of June 3 1907.

This *coup d'état* secured to the Government a numerical majority in the Third and in the Fourth Dumas, while at the same time it weakened the moral authority of these Assemblies and made the Moderates more susceptible to the appeals of the Lefts.

Some of the points of the complicated electoral system introduced by the Manifesto of June 3 1907 may be mentioned. The deputies were chosen by provincial electoral colleges, only the principal landowners and capitalists had the right to vote personally in these colleges, while other citizens had to exercise their right through representatives chosen at preliminary meetings. The direct franchise was conceded to persons holding land in varying quantities in the different provinces, roughly from 150 dessiatines (about 400 ac.) to 600 des. (about 1,600 ac.), or town property of the value of 15,000 rubles (about £1,500). The preliminary assemblies were constituted separately for smaller landowners, smaller householders in the towns, the clergy, factory and workshop workmen and peasants. Electors belonging to different nationalities could be divided into separate electoral groups by ministerial decree. The elections in Petrograd, Moscow, Kiev and Odessa were to be carried out by direct suffrage.

Stolypin's counter-offensive against the revolutionary movement could not be restricted to measures of police and emergency legislation: it made itself felt in the intellectual domain.

In spite of the outward pacification of the country there was no real settlement, and the flames of political passion burst out occasionally with ominous violence. The close of 1910 was marked by an increased agitation among the students—the most sensitive and audacious element of Russian society. Harrowing tales of flogging and tortures practised on political convicts in the prisons of the North and of Siberia had reached the educational centres, and a series of strikes and indignation meetings began in all the various high schools of the empire. The professors and academic authorities did all they could to put an end to these disturbances and to ensure the continuation of teaching, and the majority of the undergraduates supported them in this respect. The reactionary bureaucrats, however, with M. Kasso, the Minister of Public Instruction, at their head, decided to use these sad occurrences in order to overthrow the self-government of the universities, conceded to these institutions by the Imperial ukaz of Aug. 27 1905, and to curb the rebellious spirit of the students by stern centralization. Towards the end of the Christmas vacation M. Kasso and the Council of Ministers issued decrees ordering the establishment of a strict régime of official inspection, the closing of students' unions and societies with the exception of the scientific ones, and, eventually, the direct interference of the police for the maintenance of order within the universities and high schools. As a protest against these measures, strikes and obstructions broke out again in all the establishments for higher education; lectures had to be delivered in the presence of police officers, armed constables occupied the halls and corridors of academic buildings, and wholesale arrests and deportations of undergraduates took place. In Moscow the Rector (Prof. Manuilov) and his assistants declared that they could not assume responsibility for the carrying into effect of the ministerial measures, and resigned their offices, when thereupon they were deprived of their chairs; 63 professors and lecturers tendered their resignations as a mark of sympathy with their dismissed comrades. This did not disturb the minister in the least, and he promptly accepted most of the resignations, although this involved the intellectual ruin of the oldest and most famous university of Russia. The "Pride's Purge" in Moscow was followed by a number of dismissals in other educational establishments; it was obvious that some of these repressive measures had been prompted by feelings of jealousy and revenge on the part of the minister.

The unsparing scourging of the academic corporations produced the desired effect of outward submission, but it brought the feelings of hatred and humiliation among the intellectuals to the highest pitch, and the outcasts and convicts of the university "Stories" afterwards formed the principal contingent among the embittered intellectual leaders of the revolution.

Another sign of the times may be discerned in Stolypin's legislation in respect of the Zemstvos of the western provinces (Kiev, Volhynia, Podolia, Mogilev, Minsk and Vitebsk). The introduction of a measure of local self-government would have

been in itself a boon to the population of these provinces, but Stolypin made it an occasion for a renewed humiliation of the non-Russian nationalities, strongly represented in these districts. The project of the Government disfranchised the numerous Jewish population, and drove the Poles into a position of inferiority by dividing the electorate according to national colleges and establishing beforehand the preponderance of the Russian colleges by means of an artificial scheme of repartition. The unfairness and political short-sightedness of these restrictions provoked a strong opposition even in the docile Third Duma.

In the Council of the Empire a coalition between the Rights and the Lefts led to the rejection of the bill. Stolypin did not submit in the face of such an assertion of independence. He prorogued the Duma for three days (May 14-17), and in the interval obtained an Imperial decree promulgating the law as an emergency measure on the strength of Art. 87 of the Organic Laws. In consequence of this snub administered to the Legislative Assemblies, the Octobrist Centre could no longer support the Government; the leader of the Octobrists, A. Guchkov, resigned the presidency of the Duma, and votes of censure on the Government were passed in both Houses on the resumption of their sittings. Stolypin's position was made untenable by these events. His victories meant in truth the breakdown of his programme. The Premier had again to rely exclusively on the goodwill of the autocratic Tsar as against independent public opinion, and he had to strive for that goodwill in the enervating and treacherous surroundings of Court intrigue, in which obsequious chamberlains were more expert than himself. The consciousness of failure was clearly expressed in Stolypin's behaviour after the smashing of the universities and the snubbing of the Legislative Assemblies. He looked worn in July 1911, and alluded repeatedly to his approaching resignation (Prof. Pares, in the *Russian Review*, 1912).

The *coup de grâce* came from the midst of the secret police, that had become the mainstay of the Imperial system in its struggle against rebellion. One of the agents of this organization, Bogrov, inflicted a mortal wound on Stolypin at a gala performance in the Kiev Opera House on Sept. 14 1911. The hatred of oppressed nationalities and of the humiliated intellectual class had armed the hand of the assassin, a well-educated Jew.

One part of Stolypin's activity calls for special examination, his land reform, which may be considered as the immediate introduction to the social revolution of 1917.

*Defects of the Emancipation.*—The agrarian revolts of 1905 attracted the attention of the Government and of society to the deplorable condition of the most numerous and important social class, the peasantry. The causes of the growing impoverishment of the peasantry are to be sought primarily in the manner in which the emancipation of 1861 had been carried out. The Emancipation Act of Feb. 19 1861, liberating the peasants from personal serfdom and giving them part of the land on certain conditions, was meant at the same time to achieve two other purposes: it tried to secure the necessary number of workmen for the landowners, who had lost the gratuitous labour of their serfs, and to ensure the collection of taxes and redemption payments. Each peasant received at the emancipation a certain quantity of land from the landowner; he had to pay for it a redemption price, the amount of which was fixed by the Government: the payments had to be completed in 45 years. The plot of land which the peasants got as their share on the transaction was called the holding (*nadel*): its size varied greatly in different provinces. "Large" holdings ranged between 2½ (about 8 ac.) and 12 dess. (33 ac.), while minimum holdings corresponded to one-half of the maximum ones. The landowner's share comprised, besides his domain land, from one-third to one-half of the land formerly occupied by the peasants, on the condition that the latter should receive no less than the minimum holding. Besides these two principal types of holdings the Emancipation Act of 1861 established also the "beggarly" or "gratuitous" holding, which was to be no less than one-quarter of the maximum one. The gratuitous holding was established by free agreement between the peasants and the landowner; in this

case the peasants had to pay no redemption, while the landowner kept all the rest of his land. On the whole the quantity of land held by the peasants had been much reduced.

The following figures for the province of Saratoff may serve as an illustration:—

Peasants who held		before 1861	after the emancipation
More than	the "large" holding	48.1	5.8 per cent
From ½ to 1 of	" " "	35.8	4.8 " "
Less than ½ of	" " "	16.1	5.2 " "

In 1861 688,826 peasants received beggarly holdings; they held 502,383 dessiatines. In 35 provinces 921,826 souls<sup>1</sup> were assigned one-half of the large holding each and held 1,530,000, or less than 2 dessiatines per soul.

The peasants' landholdings, which were already whittled down at the time of the Emancipation, were further reduced after it by the increase of the population. A Commission for the investigation of the conditions and needs of the peasantry described the diminution of the peasants' holdings in the following manner: in 1860, 4.8% decrease on the average; in 1880, 3.5% decrease and in 1900 2.6% decrease. Besides a portion of the arable land, the peasant lost at the Emancipation the right of using the landowner's pasture, of cutting wood in his forest, and some other subsidiary rights important in peasant farming.

The redemption payments were a heavy charge on the peasant's budget. The Agricultural Commission of 1872 found that squires had to spend on taxes less than 14.5 kopeks per dess., while the peasants paid more than 95.5 k. per dess. In addition the peasants had to pay the poll-tax, the amount of which was about 4r. 45k. per soul. The same Commission states that in 37 provinces the taxes and redemption payments of the former state and appanage peasants comprised 92.75% of their net income from land, the payments of former unfree peasants 198.25 per cent. Professor Yanson calculated that in the province of Novgorod the taxation of peasants who got small holdings was, in relation to the net income of their land, 275% in the case of the peasants who owned their land, and 565% in the case of those who had to pay the land redemption. This means that the peasants had to find other sources of revenue in order to satisfy the collectors of the land tax. The Government made some attempts to relieve the peasants' tax load. The salt tax was abolished in 1880, the poll-tax in 1882. But these measures could certainly not solve the financial difficulties of the peasantry. Arrears grew rapidly to enormous proportions.

The following figures show the growth of arrears from redemption payments in the province of Tambov:—

1871-5	3%
1876-80	5%
1881-5	16%
1886-90	35%
1891-5	124%
1896	151%
1897	205%
1898	244%

Driven by land hunger, the peasants farmed on lease a large part of the State's appanages and of squires' land, but this expedient cannot be considered as an effective help in the solution of the land problem. The rent paid by the peasants to the landowners was usually very high. It is important to notice that certain plots of land, the use and possession of which was an essential necessity for the whole community, for example strips bordering on watercourses, remained usually after the Emancipation in the hand of the landowner. This gave him the power to require exorbitant rent for such land and keep the peasants in permanent fear of losing these grounds, without which village life was practically impossible. This led to continual collisions. Under such conditions the backward and extensive methods of peasant cultivation proved very difficult to reform.

One of the most important defects of the peasant's landholding before the land settlement of Stolypin was the intermixture of strips in the open fields. The land of a community lay only seldom in a compact block. It was usually divided into a number

<sup>1</sup> Persons doing the normal work of a villager.

of smaller "shots" sometimes mixed up with lands of other villages and landowners. The blocks of land belonging to the same community were again subdivided into strips, which were sometimes 2 to 3 yd. broad and some hundred yards long. Each household held a certain number of strips 20-30-50, sometimes even 100-150. The strips were scattered at a great distance from the farmyard, and the driving to them entailed a considerable waste of time and work: this hampered greatly the farming arrangements of the villagers. A peasant of the province of Novgorod calculated that he and his horse had to make about 1,548 versts (a verst is about  $\frac{1}{2}$  mile) every summer merely to go to and from his field situated at a distance of 3 versts from his farmyard. But some strips lay at a distance of 15-20 v. and even more. The intermixture of strips separated from each other only by narrow balks obliged the whole community to follow the same system of cultivation, which was usually the three-fields one. The very large extent of fallow land, the poor manure produced by weak, badly fed cattle, the carelessness of the holders who were not sure of keeping their land permanently—all this had the most ruinous effect on the peasants' farming. Under such conditions, hampering individual energy and initiative, the production on the peasants' holdings was very low indeed. The average value of the gross produce in 27 provinces<sup>1</sup> of one dessiatine of peasants' land was 8r. 99k., while the average cost of production per dess. was 5r. 22k.; so that the net produce per dess. amounted only to 3r. 77k. The productiveness of the squires' estate was 12-18% higher than that of the peasants, but if we take into consideration that a large area of landowners' land was taken on lease by the peasants, the difference in the results of cultivation would be much greater. Mr. Yermolov puts it at about 50%.

*Decay of the Peasantry.*—The growing impoverishment of the peasantry during the whole period which followed the Emancipation of 1861 is reflected in the following description of peasants' life under normal conditions, taken from a memoir of the Zemstvo of Tula:—

The peasant's life is hard and unsightly even in periods of comparative welfare. Generally he lives in a cottage of 8-9 yd. width and no more than 3 yd. in height. Cottages without chimneys are still very common, the smoke being let out through a hole in the roof. The roof is almost always thatched. In many provinces the walls are covered with dung for the sake of warmth. A peasant's family, sometimes a numerous one, is huddled together in a space of 20-30 sq. yards. The floor of the cottage is almost always bare soil, because lambs, calves, pigs and even cows are put in during the cold weather. Skin diseases are very common among the population. Meat, bacon, oil, butter appear on the peasant's table only on exceptional occasions, perhaps two or three times a year; his usual fare is composed of bread, porridge, kvass, cabbage and onions.

A very characteristic symptom of the decay of the peasants' farming is the reduction of the number of horses and the increase in the numbers of horseless households. A comparison of the figures of the horse statistics in 1888 and 1893-4 proves that in 31 provinces the number of horses had fallen by 10-88 per cent. The number of horseless households had increased during the same period in 23 provinces of central Russia from 21.5% to 26.85 per cent. More than 25% of the households have no horses at all; another 25% have only one horse each.

Let us now examine a peasant's normal budget as it is presented in the remarkable work of Mr. F. A. Shcherbina (edited by Prof. A. J. Chuprov). A medium budget of a peasant was balanced at 54r. 92k. The budget of a medium peasant household consisted of the following items:—

Income from:—	
Corn on his land	16 r. 20 k.
Corn on household land	1 r. 02 k.
Straw and hay	8 r. 16 k.
Gardening	2 r. 63 k.
Cattle-breeding	9 r. 99 k.
Trade or craft	8 r. 47 k.
Sundries	7 r. 26 k.
Total	55 r. 63 k.

Expenses:—	
Corn	18 r. 10 k.
Food for cattle	8 r. 45 k.
Vegetables and fruit	1 r. 30 k.
Meat	3 r. 90 k.
Rent	1 r. 2 k.
Taxes	2 r. 65 k.
Sundries	20 r. 10 k.
Total	55 r. 54 k.

Assuming that 19 puds of corn per head are the minimum necessary during one year and that 7.5 puds are sufficient for fodder, Mr. Maress calculated that 70.7% of the peasant population had less than 19 puds per head, 20.4% had between 19 and 26.5 puds per head, and only 8.9% had more than 26.5 puds per head. This means that 70.7% of the farming population could not live on the income from their land and would be reduced to semi-starvation if they could not find any supplementary means of existence. No wonder the standard of living of the great mass of the people stood exceedingly low. The following figures<sup>2</sup> enable us to form a judgment as to the comparative consumption of corn in various countries; in studying them one must remember that corn was the staple food in Russia and that meat played a negligible part in the bill of fare of the people.

Average Corn Consumption and Production; per head  
(in kilograms): 1909-14.

	Pro- duction	Con- sumption
Canada	1,696	1,326
United States	1,151	1,108
Hungary	651	552
Argentina	1,322	509
Germany	417	497
France	421	480
Rumania	875	420
Russia	445	381

The state of mind produced by this situation among the peasantry may be gathered from the opinions expressed by peasant deputies in the Second Duma in the course of the debates on agrarian reform. One of the members of the Right, Prince Sviatopolk Mirski, had said that the ignorant and inexperienced mass of the Russian people had to be guided by the landlords as a flock is guided by shepherds. Kisslev, a peasant belonging to the group of toil, replied:—

"I should like the whole of peasant Russia, the whole of the Russian land, to remember well these words of the noble descendant of Rurik. . . . We have had enough of that kind of thing! What we want are not shepherds, but leaders, and we know how to find them without your help. With them we shall find our way to light, to truth, to the promised land!"

Afanassiev, a non-party deputy, an ex-soldier, said, among other things:—

"In the Japanese war I led a number of mobilized soldiers through estates (of the squires). It took us forty-eight hours to reach the meeting place. The soldiers asked me: 'Where do you lead us?'—'To Japan.' 'What for?'—'To defend our country.' They replied: 'What is that country? We have been through the estates of the Lisetskys, the Besulovs, the Padkopailovs. . . . Where is our land? Nothing here belongs to us.'"

The same deputy said on another occasion:—

"Work, sweat and use the land! But if you do not wish to live on the land, to till it, to work on it, you have no right to own it!"

The great majority distrusted projects of expropriation based on the idea of compensating the former landowners, as likely to lead to unfair adjudications to the advantage of the squires. Some of the leaders were calculating how much should be taken outright, without any compensation; a few demanded the whole. Plianych, a socialist, exclaimed: "Throw them all off!"

*Government Policy.*—In order to meet this disastrous situation the Government made attempts in three directions—the increase of the size of peasants' holdings, emigration and the improvement of agricultural methods. It would be erroneous to think that the deficiency in land could be entirely removed by new distributions from the estates of the squires and the domains of the Crown. In 1906 the distribution of land among different classes of land-

<sup>1</sup> Statistics of the Taxation Department 1903.

<sup>2</sup> Nordman, *Peace Problems: Russian Economics*, p. 36

owners was as follows (*La Réforme agraire en Russie*, Ministère de l'Agriculture, 1912):—

Crown land	133,038,883 dess.
Peasants' holdings	119,067,754 dess.
Land bought by communities and associations of peasants	11,142,560 dess.
Land bought by individual peasants	12,944,154 dess.
Land of the gentry	49,287,886 dess.
Land owned by other classes	22,664,493 dess.
Land owned by various institutions	6,985,893 dess.

The enormous area of the Crown lands was mainly covered by forests or situated in the northern and eastern provinces, so that it could not be used for agricultural purposes; the surface of convenient land in the hands of the Crown was only about 3,700,000 dess. The arable land owned by the Church and different ecclesiastical institutions amounted to 1,672,000 dess. (Statistics of the Holy Synod, 1890); the appanages comprised arable land of 2,000,000 dess. If we take into consideration that a large part of the landowners' land was covered also by forests, we come to estimate the surface of the arable land owned by squires at about 35,000,000 dess. (Vermolov). The sum total that could be disposed of would thus amount to 45,000,000 dess., or about 30% of the area of the peasants' holdings; divided among the villagers it would make less than one additional dessiatine per soul. The insufficiency of the land reserve becomes even more evident if we keep in mind that about 85% of the Crown's arable land, 90% of the appanage arable land, and a considerable part of the squires' land were already leased by the peasantry. Of the 7,449,228 dess. which were sold by a newly instituted Peasant Bank to the peasants from 1882 to Jan. 1 1906, village communities acquired 25.6%; peasants' associations 72%; individual householders only 2.4 per cent.

The peasants' revolt of 1905 and the new schemes of Stolypin gave an entirely new direction to the agrarian policy of the State. The Manifesto of Nov. 3 1905 suspended all redeeming payments after Jan. 1 1906. Of the surface of 2,846,620 dess., which the bank sold directly from Jan. 1 1906 to June 1 1913, peasants' communities got 5.5%, peasants' associations 14.8%, individual owners 79.7 per cent. The peasants also acquired from the landowners, with some assistance of the bank, 4,375,163 dess. It is estimated by Oganovsky that the result of the bank activity until July 1 1910 was the creation of 45 to 50 thousand separate farms and of 130-140 thousand small compact plots, the owners of which live in hamlets.

Let us turn now to the policy of the Government concerning emigration. The law of 1889 had subjected emigration to official supervision. Those were allowed to emigrate who were able to pay the expenses of the journey and of the installation of a new household, provided their departure did not harm the remaining members of the community. No Government assistance was given to the emigrants. Permission to emigrate was refused if the local authorities considered that the emigrants could find work in the old district. Those who emigrated without an official permission had to be sent back. These regulations resulted in a great reduction of the emigration movement, which was practically closed to the poorest peasants.

The events of 1905 and the new orientation of the Government brought a great change in the emigration policy. Greater facilities were granted, and Government assistance was promised by the Provisional Rules of June 6 1906. But the growth of emigration which followed the new regulations was obstructed by a complete lack of organization. The following figures give us some insight into the working of the new laws:—

	Emigrants to Asia (in thousands)	Emigrants returning from Asia (in thousands)
1906	139.1	13.7
1907	427.3	27.2
1908	661.8	45.1
1909	619.3	82.3
1910	316.2	114.9
1911	166.5	84.4

These figures prove that the emigration policy of the Government was far from successful.

We have now to consider the third branch of the Government activity, directed towards the solution of the agrarian question. The scheme for improving agricultural methods was based on a reform of the distribution of the land. In 1861 a legal confirmation of the peasants' customary commune was considered the best means to secure the return of the money advanced by the State for redemption. The statistics of landownership in 1905 showed that 23.2% of the households and 17% of the land owned by the peasants were held by private tenure; 76.8% of the farms and 82.7% of the peasants' land were in communal tenure. The right of property was attributed not to separate householders but to the whole village community, as a juridical person. In the case of communal land tenure only the farmyard belonged to households in permanent tenure; other land belonged to the whole community, and was subject to occasional redvisions. Unfree domestic servants were assigned to peasants' communities, but did not obtain holdings; they formed in this way a village proletariat.

In the reign of the Emperor Alexander III. the communal tenure, which was regulated by the Liberation Act of 1861, came to be regarded as a political safeguard, and its decay was considered to be a national danger. The law of Dec. 14 1893 made practically impossible the transition from communal to household tenure. But the growing impoverishment of the peasantry gave evidence that the existing land system ceased to be beneficial. The special conference established by an Imperial Order on Jan. 22 1902 recognized for the first time the necessity of a fundamental change in the existing land settlement of the peasants. The majority of the Conference were of the opinion that the communal tenure and the intermixture of strips were the chief causes of the alarming condition of the peasantry.

*Stolypin's Land Settlement.*—The agrarian disorders of 1906 gave increased importance to the problem, and proved that the settlement of it could not be postponed any longer. In the years 1906-7 the problem of land reform excited the strongest interest in governmental circles, and played a most prominent part in the programmes of different parties and in the debates of the First and the Second Dumas. Stolypin took the initiative on the part of the Government and eventually obtained the support of the Third Duma. His scheme was directed towards a political purpose, the creation of a conservative class of small peasant owners who could be counted upon to defend the existing régime. This class had to be strong and progressive from the economic point of view, as it was clear that the improvement of the peasants' condition could be attained only by more intensive farming. As was said above, some measures had been taken to enlarge the area of the peasants' holdings without violating the interests of the squires. But the greatest part of the Government activity was directed to a complete reconstruction of relations inside the village, to the creation of separate farms and to the spread of individual ownership. The Imperial ukaz of Nov. 9 1906, the Land law of June 14 1910, and the Agricultural law of May 29 1911 were enacted for this purpose. The leading features of Stolypin's scheme were as follow. Each householder possessed of land in a village community can demand that his land shall be constituted a plot in individual property. A simple majority of the village assembly may convert the holdings into the land owned privately. The land has to be assigned to the claimant, if possible, in a single block. The conversion of the land of the entire community can be decreed by a resolution of the village meeting passed by a simple majority of the members. All the communities where there had not been any redvision of land since 1861 were declared to have passed from communal tenure to individual or household ownership. The formation of compact plots could not be refused if it was asked for by not less than one-fifth of the householders. The Land Commissions created by the ukaz of March 4 1906 were entrusted with the redistribution of land under the new land settlement.

In the Duma the Right clung to the opinion which had been predominant in the time of Alexander III.; the Left entertained

the hope that the communal land tenure was to form the cradle of future collectivism. The Cadets mostly agreed with the principles of the Government scheme, but they objected to the coercive character of its methods. The majority of the House supported the Government and carried its bill through the Duma. The motives that influenced the deputies of the Duma were well expressed by the chairman of the Land Committee, S. Shidlovsky, in his speech on Oct. 23 1908:—

"Our attitude as regards the decree of Nov. 9 is in substance a favourable one, because this decree aims at the development of individual land tenure and individual land tenure is certainly the necessary condition of improved cultivation, and the latter means the solution of the agrarian problem. . . . The foundation of a State ruled by law consists in a free, independent and energetic personality. Such a personality cannot exist unless you allow the common right of ownership, and no one who wishes the State to be ruled by law should oppose the spread of private property in land. Land is, after all, only a basis for the application of labour and capital, and labour is most productive when the labourer is placed in favourable conditions. In the forefront in this respect we have to place an open door for personal enterprise, free play for creative energy, security against outside interference, personal interest. . . . The avenue towards a permanent improvement in the existence of our peasants is to be found in an immediate increase of production and income from land, and this cannot be achieved without the help of outside capital. . . . A law which opens the way to personal property enables the agricultural worker to display his creative force."

It seemed as if the reform had achieved an immediate and striking success. Before Jan. 1 1913 the Commission had arranged farms on an area of 7,413,064 dessj, held by 738,980 households; strips had been concentrated into blocks on an area of 4,359,537 dessj, held by 585,571 households.

The following figures illustrate the first part of the Commission's work from 1907 to 1911.

Up to April 1 1911 the number of peasants who wanted to leave the commune amounted to 2,116,600, or 23% of the whole number (9.2 millions). The movement towards enclosures was not equally popular in all the parts of the Empire. To make the process clearer we may divide the country into 5 areas: (1) South-East, (2) Agricultural Centre, (3) two Industrial Centres, round Petrograd and round Moscow, (4) South-West and West, (5) North and North-East (Oganovsky).

The following figures show the proportions of demand for compact plots in each of these provinces in proportion to 1,000 households:—

	S.E.	Agr. Cent.	Ind. Cent.	S.W. and W.	N. and N.E.	The whole country
Till Nov. 1907	2.8	0.9	0.5	5.2	0.4	1.4
Nov. 1907						
Nov. 1919	7.9	7.2	3.7	14.6	2.7	6.7
Nov. 1908						
May 1909	15.8	9.1	6.6	15.6	1.7	8.9
May 1909						
Jan. 1910	6.1	5.0	4.8	7.3	2.1	4.9
Jan. 1910						
July 1910	5.2	4.6	4.8	8.6	1.4	4.7
Aug. 1910						
April 1911	2.5	3.1	1.8	6.1	1.0	2.8

The number of demands for separate farms before April 1911 for each 1,000 households who held their land in communal tenure were:—S.E. 320.6; Agr. Cent. 236.9; Ind. Cent. 172.5; S.W. 427.3; N. and N.E. 77.9; whole country 234.9.

These figures show that the greatest number of demands for separate farms were made in the South and South-East provinces, where the most extensive agricultural methods prevailed. It appears also that after May 1909 the number of householders applying for farms diminished in a marked proportion. The area of the compact plots was generally very small; and the percentage of poor peasants who asked for enclosure was growing. Their intention in getting rid of communal ties was to sell their land.

To judge by these data, the Government scheme of creating a class of small independent farmers was not in a fair way to success. As was shown above, most of those who asked for separation held only a small plot, and belonged to the poorer peasantry. Even with Government assistance they were unable to start separate farms, as this undertaking involves in the beginning a considerable outlay of capital. Besides, the natural conditions in some parts of Russia were not favourable to separate farms or homesteads. One of the chief difficulties was the lack of water, which cannot be found at all, except in con-

nexion with considerable rivers, in very large tracts of the "black soil" area. This fact, together with the traditional leaning of the peasantry to village life, obliged the Land Commission to keep up on many occasions the village system even after the concentration of the fields.

A memoir drawn up by the conference of Old Ritualists held at Moscow on Feb. 22-25 1906 discloses the view taken by the peasantry on the question of communal land tenure. The opponents of the commune suggested that it made impossible any improvements in agricultural methods and diminished the productive power of the soil; its supporters stated that communal tenure was the only system based on justice; this consideration is characteristic of the traditional feeling among the Russian people. The Government scheme sacrificed justice for the sake of expected increased production. Stolypin himself described the new land settlement as "a stake on the strong."

The small area of the holdings of the new farmers and their economic helplessness had, however, a very unfavourable influence on the expected increase of production. A farmer who held only 8-10 dessj. of land could not introduce any extensive improvements in his household in the absence of cheap credit. Stolypin recognized that "primitive methods were used by the peasantry as before." On the other hand, the rapid growth of emigration was one of the results of the new settlement.

The land settlement of 1906-10 was carried out with uncommon energy, but the social needs of the population were not satisfied. The Government was accused of having destroyed by a stroke of the pen an institution formed by centuries. The sudden change affected not only the economic conditions of the peasants' life, but the juridical relations between the members of the family were also shaken. Before the new settlement the life of the peasants was based on the participation in the common holding of all the members of the household. The new law substituted for this family tenure the individual ownership of the chief householder. All the other members of the family suddenly lost their rights in the land.

Other important inconveniences were also pointed out: the compulsory introduction of the reform, the danger of the increased competition, the buying up of the peasants' land for speculative purposes, the increased difficulties of existence in the case of the small households. The great end of the settlement—the creation of a strong, wealthy and conservative class of small landowners, was not attained. The necessity of extensive Government assistance and credit for the improvement of agriculture was felt more and more, but the financial estimates under this heading for 1911 amounted only to 4,000,000 rubles.

Altogether it may be said that Stolypin's agrarian measures could take effect only if they were accompanied by a steady policy making for agricultural education and backed by extensive credit. Even in such a case a long time would have been necessary to enable them to strike root. Their immediate consequence was rather to increase the fermentation in the villages and to excite and embitter the feelings of the villagers, who were losing faith in the village community without acquiring any other standard of economic organization. Thus the legislation of 1906-11 helped the agrarian upheaval instead of preventing it.

*The Third and Fourth Dumas.*—The death of Stolypin left a wide gap in the ranks of the Government, and the appointment of M. Kokovtsov, the Minister of Finance, to the premiership did not result in a rejuvenation of the bureaucratic system. The new Premier was in favour of continuity in policy; this meant that he would keep on the lines traced by Stolypin's initiative and avoid new departures as far as possible. He was a trained administrator, placed by chance at the head of the country in a time when caution and routine were certainly insufficient to meet the requirements of a critical situation. The principal achievement of the three years of Kokovtsov's rule was apparent success in the management of financial operations. The budget grew every year and reached in 1914 the enormous sum of 3 milliard rubles, and yet not only was a deficit avoided, but some 1,500 millions in gold were accumulated as a reserve fund to sustain the currency and meet possible emergency calls.

The instability of the vast structure buttressed on the chronic alcoholism of the people was duly perceived by public opinion, and a campaign was started in the Duma to put an end to this shameful and perilous situation. One of the Duma members, Chelyshiv, was the soul of this active agitation in the Legislative Assemblies and in Government circles. He succeeded in obtaining the formation of a commission to examine and report on the subject, but his abolitionist plans were obstructed by the opposition of the Finance Ministry, which did not see its way to balance the budget without the resources supplied by the monopoly of the sale of spirits.

Yet signs were not wanting that the welfare of the country was seriously threatened, in spite of the deceptive appearances of an enormous and duly balanced budget. The harvest of 1911 was so poor that in 1912 Russia was visited by a severe famine. Yet the Government refused to let voluntary organizations assist in fighting the disaster; only associations affiliated to the Red Cross or to the Zemstvos were allowed to send agents into the provinces, to collect and to distribute funds. The public works organized by bureaucratic boards were conducted in a very unsatisfactory manner: the peasants got hardly any help from them, as support was systematically directed to assist householders who owned horses and were altogether better off. Public opinion was incensed but powerless. As regards workmen in factories and workshops some progress was made in connexion with insurance against ill-health, but in other respects the employers were left very much to their own way, with the result that strikes, which had decreased considerably in number and intensity after the collapse of the revolutionary movement in 1907, began to multiply again. In 1912 2,032 cases of strikes were registered, in 1913 4,098. On many occasions the unrest was quelled by the intervention of Cossacks and soldiers. The most terrible case of the kind occurred in the gold-fields of a company largely supported by British and other foreign capital—the Lena Company: a dispute as to wages and maintenance was terminated by a fusillade in which 162 workmen were killed.

It is difficult to estimate the exact effect of this kind of administration on the peasants and workmen subjected to it, although there can be no doubt that bitter resentment was increased by the fact that it was driven underground. But indirectly the disappointment and disaffection of society left its mark in the growth of political opposition in spite of all the efforts of the Government to suppress it and to obtain outward compliance by means of artificial restrictions of the franchise and downright pressure on the electors.

The dissolution of the Third Duma on the completion of its period of five years presented an opportunity for an attempt of this kind on a large scale. The Third Duma had been led by the Octobrist party in conjunction with the moderate Right. This policy had suffered shipwreck through the absolutist bent of Stolypin's administration and the colourless leadership of Kokovtsov. In the last sessions before its dissolution the Duma assumed a frankly hostile attitude towards the Ministry and the leader of the Octobrists, A. Guchkov, pronounced thundering indictments against the "irresponsible influences" which shaped the course of politics from behind the scenes: the egregious mismanagement of the Artillery Department, presided over by the Grand Duke Serge Mikhailovich, and the scandalous influence of the Empress's protégé Rasputin, gave good grounds for these attacks. The decree of June 3 1907, which had introduced an intricate and restricted franchise, provided convenient handles for the gerrymandering of elections, and Kokovtsov's Government made full use of them in order to secure a Government majority in the Fourth Duma. Especially conspicuous was the mobilization of the parish priests by command of the Procurator of the Holy Synod, Sabler: the clergy were enjoined to exert all their influence on the peasants in order to ensure the election of deputies of the Right. The bureaucracy was so far successful in this campaign that, thanks to its pressure and to the evident breakdown of the plan of a coalition with the Government, the Octobrists were defeated in a number of districts and their leader, Guchkov, succumbed at the polls.

The party grouping may be tabulated as follows:—(1) The Right, 67; (2) Moderate Right, 38; (3) Nationalists, 55; (4) Centre (Krupensky's group), 28; (5) Octobrists, 87; (6) Progressists, 37; (7) Constitutional Democrats, 60; (8) Social Democrats, 14; (9) Polish circle, 13; (10) Mahommedans, 6; (11) No party, 20; (12) Group of Toil, 7; (13) Of unknown party allegiance, 17.

The new Duma was thus apparently more reactionary than the one which had preceded it. But public discontent and the inability of the Government to frame any effective policy of reform produced the unexpected result that a combination was brought about between the groups of the Left, the Octobrists, and even, in some cases, the Right Centre. In a general way the Duma assumed an attitude of opposition as regards the Government and the reactionary Council of the Empire. This line of policy was especially conspicuous in a long series of interpellations and resolutions of want of confidence carried against arbitrary acts of the authorities. The following interpellations may be mentioned among many: on the illegal acts of the police during a search in the house of the deputy Petrovsky; on the acquisition of the Kiev–Voronzh railway line by the State; on naphtha trusts; on the secret dealings of the Government with Baron Günsburg, the principal director of the Lena gold-field; on an illegal ordinance of the Petrograd prefect concerning the suppression of hooliganism; on a reform of the Medico-Surgical Academy of Petrograd by an illegal order of its principal; on the spending of money without warrant from the Legislature and failures in carrying out the conditions as to grants and credits, etc. And yet when a bill was passed by the Duma to establish rules as to the responsibility of civil servants, the Council of the Empire refused to sanction the most modest requirements in this respect, although even the Minister of Justice had expressed his agreement. On the other hand, the Government did not scruple to prosecute a deputy (Kusnetsov) for a speech he had made in the Duma, and the administrative department of the Council of the Empire laid down the principle that members of the Legislature were liable to prosecution in such cases.

All measures of home policy, even the most urgent ones, were regarded from the point of view of political strife. The Education Committee of the Duma, in conjunction with the Zemstvos, had worked out a plan for the provision and equipment of a sufficient number of elementary schools in order to secure universal instruction throughout the country. It was calculated that some ten million children had to be accommodated in the schools, in addition to about five million who were already enrolled for a course of three years in the schools of the towns and the Zemstvos (provinces). In order to achieve the result by 1924, the Duma proposed to develop gradually a network of schools by means of appropriations successively increased by 10,000,000 rubles a year in the course of 10 to 12 years. This scheme could not be carried out in its entirety and in a systematic form on account of obstruction from the Board of Education and from the Council of the Empire. Besides the distrust of these reactionary bodies as regards all kinds of enlightenment, they were opposed to any policy which gave precedence to secular schools over Church schools, although it could not be contested that the former were much more advanced and perfect in teaching and organization. The comprehensive law of consolidation which would have ensured a steady progress towards systematic instruction in the country was wrecked by the Council of the Empire: the "enlightened bureaucrat" Count Witte did not scruple to oppose the bill in alliance with the stalwarts of reaction, because, as he expressed it himself, it was an attempt to obtain paradise by means of child-murder, the murdered child being the Clerical school organization. Thwarted in its comprehensive policy, the Duma nevertheless proceeded on its course by occasional increase of credits for elementary education.

These constant conflicts produced a perceptible sliding towards the Left in the ranks of the Duma legislators. One of the symptoms of this process consisted in the disruption of the Octobrist party. It broke up into three small groups—the Left, hardly distinguishable from the Cadets; the Centre, which professed to devote its activity mainly to the strengthening of the Zemstvos; and the Right, which still clung to the idea of a possible alliance

with a reformed Government. The dismemberment of the Duma into a number of small party groups gave additional influence to the Cadet nucleus, which, though it counted few members in the Duma, acted under strong discipline and had a powerful press.

In one direction only the majority of the Duma was fairly in agreement with the Government, namely as regards foreign affairs and in questions concerning the interests of the dominant nationality of the Empire. In spite of certain minor disagreements between the parties of the Left and the Centre and Right, the Duma as a whole was decidedly Nationalistic. The Third Duma had bequeathed to the Fourth a definite line of policy concerning the Finland conflict: the Legislature backed the Government in its endeavours to subordinate the autonomy of the Finnish State to the superior claims of the Empire. The view that the union between the Grand Duchy and Russia was a *real* and not a *personal* one led to the assertion of the supreme jurisdiction of the Imperial Senate and of the St. Petersburg Court of Appeal over Finnish tribunals; to the passing of laws commuting the obligation of personal military service for money payments; and to the recognition of Russians dwelling in Finland as citizens of the Grand Duchy on equal terms with native Finns. Even the Cadets did not contest the general principle from which such demands were derived, although they disapproved of the raising of issues which embittered the intercourse between nationalities and led to unpleasant consequences in the shape of passive resistance and the incarceration of Finnish officials who refused to recognize the legality of the interference of Russian institutions in Finnish affairs, apart from the traditional channel of the governor-general and Senate as representing the authority of the Grand Duke.

The creation of the new province of Chelm (Kholm), separated from the provinces of Lublin and Sedlitz, envenomed another national conflict of long standing—that between Russians and Poles. The new Government was formed out of districts in which the dominant ethnographic element of the population was Little Russian and not Polish, although this population had been included for centuries within the boundaries of the Polish State and had been recognized as part of Congress Poland annexed to Russia by the Treaty of Vienna (1815). The Duma passed the law of separation without taking heed of the violent protests of Polish public opinion.

*The Conflict with the Central Empires.*—The Nationalistic orientation of the Third and Fourth Dumas was put to the test by the growing entanglements of foreign policy in the course of the years 1911-4. Russia had definitely joined the combination of Western Powers against the predominance of Germany, and opinion in the country fully supported this momentous change of front. The annexation of Bosnia and Herzegovina by Austria under the protection of Germany "in shining armour" was strongly resented, not only by Stolypin and Isvolsky as the official exponents of Imperial policy, but by the nation at large, the more bitterly as it was felt that Russia was not in a position to give free vent to her dissatisfaction. No wonder that in 1911, during the Agadir affair, Russia was found on the side of Kaiser William's opponents. But matters became especially serious when the Macedonian hostilities, which had been smouldering for decades, burst out into flames in 1912. The coalition between Bulgarians, Serbians and Greeks against Turkey had been rendered possible and effective by the support on which they reckoned from Russia; and O. Hartwig, the Minister Resident at Belgrade, was one of the principal agents in bringing it about. M. Sazonov, the successor of M. Isvolsky at the Foreign Office, cautious, but devoted to the great tradition of Russia's protectorate over the Balkan Christians, was intent on using to the full the favourable situation created by the union between the three Balkan States, the sympathy of Western Liberals and the temporary indecision of the Central Powers. In this he was supported by the Tsar Nicholas, who, however, made it clear to his agents that Russia would not risk an actual war.

The crushing defeat inflicted on the Turks by the Balkan allies seemed to justify completely the combination engineered by Hartwig. But the harvesting of the fruits of victory proved

a more difficult task than the actual fighting. The Central Powers had realized the menace of a permanent Balkan League to their ascendancy in the Near East. Austria vetoed any extension of Serbia towards the Adriatic. With the support of Germany she succeeded in depriving the Serbs and Montenegrins of the position they had won in Albania. Russia did not dare to back the latter's claims to the finish at the London Conference, and the Western Powers were disinclined to proceed without Russia. The eviction of the Serbs from the west proved fatal to the peace of Europe. They tried to recoup themselves in the east by demanding districts of western Macedonia which had been previously conceded to the Bulgarians. M. Sazonov tried to stop the growing animosity between the Balkan allies by offering the mediation of Russia, and Nicholas II. attempted rather late in the day to exert his personal influence on the wily Ferdinand of Bulgaria as well as on the Serbians. These attempts at conciliation proved unavailing: the Bulgarians broke away first, but were soon checkmated by a coalition between Serbia, Greece and Rumania. The Peace of Bucharest, which gave the Dobruja to Rumania, western Macedonia to Serbia and important districts of Thrace and Macedonia to Greece, shattered all hopes of an effective Balkan League, and laid Bulgaria open to the insidious intrigues of Austria and Germany. M. Sazonov manifested clearly the ill-humour of Russia; but this powerless discontent made her diplomatic defeat still more humiliating.

All these events were watched by Russian public opinion with keen interest and warm sympathy for the cause of the Slavs. It was realized more and more clearly that the struggle did not concern merely the small States of the Balkans, but also their big neighbours; in the Duma and in the press the attitude of the Government was applauded or criticized from the point of view of national self-consciousness and imperialistic aspirations. M. Sazonov found unexpected support from M. Milukov, the leader of the Cadets. B. Maklakov and V. Bobrinsky came forward as the spokesmen of Slavonic solidarity. No one knew exactly how much was involved in the risk of a breach with Germany, but the public at large sought a kind of compensation for the disappointments of home politics in a bold attitude in foreign affairs. In this way, when the climax in the antagonism between Austria and Serbia was reached in the assassination of the Archduke Franz Ferdinand, the Russian public was prepared to back the Government against any hostile acts of the Central Powers. The outrageous treatment of Serbia by Austria-Hungary was rightly interpreted as a provocation to the Entente, and especially to Russia. It is well known that everything was done to preserve peace, short of surrendering Serbia to an Austrian inquisition, and waiting patiently till Germany should complete the mobilization which was proceeding under the guise of "precautionary measures." The only person of any weight who advised submission at any price was Count Witte. Everybody else, from the Emperor to the most humble citizen, understood that no choice was left but to fight for existence. The dynasty was granted a unique opportunity to retrieve its misdeeds and blunders by placing itself wholeheartedly at the head of a great popular movement. The Duma, usually so critical, expressed by the voice of its various leaders the unanimous resolve of the nation to withstand the common enemy with patriotic unanimity.

*Russia in the World War.*—In the light of subsequent events the declarations made on the outbreak of the World War assume a particular significance. The representatives of alien nationalities expressed emphatically their resolve to stand by Russia in the struggle. Goldman, a Lett, said: "Neither our nationality nor our speech nor our creed prevent the Letts and the Estonians from harbouring warm patriotic feelings towards Russia and from standing shoulder to shoulder with the great Russian people for the defence of the fatherland." Friedman, a Jew, spoke in the same strain: "We have lived and we live in particularly oppressive conditions. Nevertheless, we have always felt ourselves citizens of Russia and faithful sons of the fatherland. No power will ever be able to tear us from our mother-country Russia, from a land to which we have been tied for centuries. We come forward to the defence of this country not only to perform

a duty, but because we are attached to it." Even the Poles chimed in. Iaronsky pointed on their behalf to the tragic situation of Poland:—

"The Polish nation torn into three parts sees its sons in mutually hostile camps. In spite of that our feelings of sympathy for the Slavs weld us into one whole. This is suggested to us not only by the justice of the cause taken up by Russia, but also by political reflection. God help the Slavs led by Russia to repulse the Teutons in the same way as they were repulsed five hundred years ago by Poland and Lithuania in the battle of Grinwald. Let us hope that the blood shed by us and the terrors of a fratricidal war may lead to the reunion of the three fragments of the Polish people."

If the alien nationalities spoke in this way no wonder the Russian groups expressed their resolve to spare no effort in the struggle, and to support the Government to the utmost in the task of defending the country. Even the Group of Toil declared by Kerensky's voice that they were persuaded of the righteousness of Russia's cause and ready to sacrifice everything for the country's defence. Only from the little group of Social Democrats came threatening notes. Their spokesman dwelt on the solidarity of the proletariat all the world round, on the common guilt of all the Governments in provoking the war, on the resolve of the proletariat to bring about a speedy peace, on the hope that the present terrible catastrophe would result in the abolition of all wars. These discordant notes were lost, however, in the general display of enthusiasm.

The Tsar's Government was on the crest of a mighty popular wave; it might have steered a course towards victory and national regeneration if it had possessed the moral strength to rise to the occasion, to throw away the tawdry equipment of despotism and to concentrate the forces of the people for the momentous struggle. Events soon proved that it was not only incapable of such an effort, but that its leadership was in itself a hindrance to success at home and in the war.

At the start, however, two steps in the right direction were taken by the Government: the abrogation of the State monopoly of the sale of spirits, and the promise of autonomy to the Poles. The Gordian knot of the temperance problem was cut by Imperial decree in spite of the difficulties raised by finance experts. The beneficial influence of the measure on the morals and health of the people and of the army cannot be doubted.

The results for the Imperial Treasury were not so appalling as was predicted by timorous specialists. They can be gathered from a comparison between the budgets of two consecutive years—1914 and 1915.

	1915 Estimates	1914 Estimates and Assignments	Increase or Decrease
	Rubles	Rubles	Rubles
Ordinary revenue . .	3,080,108,314	3,572,169,473	-492,061,159
Ordinary expenditure . .	3,078,814,461	3,309,523,517	-230,709,056
Surplus of ordinary revenue . .	1,293,853	262,645,956	-261,352,103
Extraordinary revenue . .	9,500,000	13,400,000	-3,900,000
Extraordinary expenditure . .	155,493,953	304,045,881	-148,551,928
From free balance of Treasury . .	—	27,999,925	-27,999,925
Deficit to be met by loan . .	144,700,000	—	144,700,000

The proposed budget for 1915 included 502,642,000 rubles of ordinary revenue from new taxes and increases of existing taxation. The necessity for this increase of taxation arose from the reduction in the Government spirit monopoly operations and the influence of war upon revenue. In the 1914 budget the revenue from the spirit monopoly totalled 936,217,500 r. or 26.2% of the total ordinary revenue. For 1915 the estimated revenue from this source was only 144,360,000 r. or 4.7% of the total ordinary revenue, a decrease equal to 22.1% of the ordinary revenue of 1914. On the other hand account must be taken of the saving that would be effected in expenditure on the spirit monopoly. This expenditure totalled 246,787,567 r. in the 1914 estimates, but was reduced by 140,374,401 r. in the 1915 estimates. So the expected decrease in the net revenue from the spirit monopoly was about 651,000,000 rubles.

The appeal to the Poles was made in a proclamation of the commander-in-chief, Grand Duke Nicholas. The grant of autonomy was held out as a reward of coöperation against the common enemy, the Germans. It would have been better if the promise had come directly from the Tsar, and if instead of vague words something tangible had been conceded at once. As a matter of fact the high bureaucracy began at once to put obstacles in the way of any reform, and the matter never reached a further stage than that of discussions in a Government committee. The damage done by these vacillations was incalculable. Instead of enlisting the wholehearted support of Polish patriots Imperial bureaucracy drove them into a position of distrust and hostility, which became especially keen in view of the tactless and offensive behaviour of Russian authorities in Galicia, and could not be placated by occasional concession in details. This episode may serve as an example of the stupid policy followed by the Government in regard to all minor nationalities of the Empire: their enthusiastic rally was discouraged in every way, and old enmities were revived and increased at the most critical time. The case of the Jews was especially flagrant: numbers of them continued to perform their military duties faithfully and zealously, but many others took advantage of opportunities to spy and to betray their persecutors, and the round of executions and pogroms set in again with increasing force.

*The Effects of Misgovernment.*—In the field the old cankers of corruption and favouritism were again producing disappointment and disaster. The army did not lack excellent leaders—the chief-of-staff of the Southern command, Alexiev, the corps commanders Ruzsky, Brusilov, Radko Dimitriev, were generals of the first rank. The officers and the common soldiers fought with the traditional tenacity and valour; no sacrifices were spared and brilliant victories were won. And yet on decisive occasions incredible things had happened. Samsonov's army was destroyed, thanks to a slackness in coöperation on the side of Samsonov's colleague, Rennenkampf, who was believed to play for his own hand. The suspicion was confirmed by a similar lapse on the part of the same commander later on at the battle of Lodz, when he failed to close the noose in which two corps of Mackensen's army had been caught. In Jan. 1915 an intelligence officer, Miassoyedov, actually sold the plans of the northern concentration to the Germans, and brought about a crushing defeat of Sivers' army. Worst of all it became clear towards the spring of 1915 that the army was insufficiently provided with munitions, aircraft, artillery and other appliances of war. The onslaught of Mackensen's and Hindenburg's Germans had to be met by soldiers many of whom had to man the trenches with sticks, in expectation that the death of comrades might give the chance of picking up rifles; batteries were forbidden to fire more than a couple of times an hour; the armies were surrounded by multitudes of "Kids"—marauders and deserters. Even in these terrible circumstances the Russians fought stubbornly, retreated step by step, and eventually, with the help of Alexiev's strategy, succeeded in arresting the stream of the invasion on the lines of the Dvina and the Dniester. But the psychological effect of this desperate campaign was a lasting one. The common men had learned that their blood was shed without stint by a Government which had been criminally careless and inefficient. The way was opened to the insidious propaganda of revolutionary defeatists and traitors. The revolution of 1917 was prepared on the battlefields of Gorlice and Krasnostav.

The progressive elements of Russian society attempted to save the situation by a great effort. The Zemstvo and Town Unions, which had been doing wonders in hospital work and equipment, offered their services for the preparation of munitions:—

Towards the end of May 1915, at a congress of representatives of trade and industry, the discussion of technical questions was interrupted by an impassioned speech delivered by one of the leading Moscow millionaires, V. Riabushinsky, just back from the front and full of the impressions of the life and death struggle against the invaders. "The whole of Russia forms the rear of the army," he said. "We cannot busy ourselves with our everyday affairs at the present moment: every workshop, every factory must be used to break the enemy's force." It was not a question of forming this or that committee, but of sinking all differences and appealing to the

assistance of every able man, without distinction of parties, as people had done in the West in France and in England. Prince Lvov spoke in the same strain on June 5 at a meeting of delegates of the Zemstvo Union. "At this great historical juncture," he said, "what is needed is not criticism, but energetic work. We do not want to produce irritation, but a bold spirit and combined efforts. We must strive to concentrate all the forces of the land and to inspire Government and society with mutual confidence." (Vinogradoff, *Self-Government in Russia*, 116, 117).

Technical committees were created with the participation of leaders of industry, Zemstvo workers, representatives of the working class: they displayed fervid energy and achieved good results. But the main condition demanded by Riabushinsky and Lvov—mutual confidence between the people and the Government—was conspicuously absent. Subordinate officials joined in the efforts of the unions, but the central Government continued to flounder in the morass of Court intrigues and supine reaction. The worthless Minister of War, Sukhomlinov, was indeed dismissed and put on his trial; the ancient bureaucrat Goremykin had to resign the premiership; but the appointment of his successor, Stürmer, provoked a general outburst of indignation. He was known for his reactionary opinions, and had shown his mettle in helping to coerce the progressive Zemstvo of Tver. His great merit was his subserviency and affected devotion to the Imperial family, especially to the Empress Alexandra Feodorovna. This obstinate and hysterical lady meddled more and more with affairs of State, particularly after the assumption of the supreme command by the Emperor. And behind her stood various favourites, chief among whom was the astute peasant Gregory Rasputin, whose exploits had made the Petrograd Court a place of scandal for the whole world. No wonder that the opening of the Duma in Feb. 1906 gave rise to manifestations very different from those which had occurred in that assembly in July 1914. The ally of Stolypin, Shidlovsky, speaking on behalf of the bloc of progressive parties, said: "The general longing of the entire country towards a situation in which the country could entertain confidence in its Government, and feel in union with it, has been traduced as an incitement to seize power. . . . The forces of the nation, bereft of unity, aim and guidance, have been spent in vain, and the great national effort has weakened under the dissolving influence of discontent and indifference." The leader of the Progressives, Efremov, addressed the ministers in the following words: "You must understand that your duty as patriots is to go, and to clear the place for a national Ministry."

The discord between the Government and the Duma found expression on many occasions in connexion with important questions of internal policy. The Duma rejected a bill as to the organization of coöperative societies because it placed them at the mercy of the administration. A strike at the Putilov works, suppressed by military force, gave rise to a heated discussion in which the Duma, while condemning the strike as "a stab in the back," expressed the desire that the legal activity of trade unions should be given free scope and that chambers of arbitration should be founded for the settlement of trade disputes. Perhaps the most significant pronouncement was made in the course of the debates on the budget of the Holy Synod. The Duma voted a resolution to the effect that it considered necessary a reform of the Church administration on the principle of the supremacy of Councils and of a wide application of local self-government. For this purpose a national Council should be convoked without delay. The reform should extend to central and to local administration, to ecclesiastical courts, especially in the matter of divorce procedure, and to the ecclesiastical schools; the parish should be developed as much as possible; bishops should not be transferred from one See to another, more particularly if the consent of the Church had not been obtained. The State should cease to look upon the clergy as a political instrument, and all circulars and orders in this sense should be revoked.

The Government seemed to take delight in ignoring and thwarting all these resolutions. Stürmer was called to one ministerial post after the other. In Feb. he was appointed Home

Secretary in succession to N. Khvostov, in July Foreign Secretary in succession to S. Sazonov, who was dismissed because he had urged the necessity of settling the Polish question in the sense of definite and real autonomy. Altogether ministerial portfolios were shuffled like cards at the bidding of the Empress. According to the winged word of Eugene Trubetskoy, ministers were following each other like "fleeing shadows." It may be sufficient to notice the advent of M. Protopopov, a convert from the ranks of the Liberal bloc to the Ministry of the Interior (Sept. 16). The dismay and indignation of the country found expression in a series of resolutions demanding the appointment of a Cabinet supported by the confidence of the people. Even conservative institutions like the Council of the Empire and the Association of the United Gentry joined in the chorus.

*The Popular Leaders.*—Before proceeding with the narrative of events which led up to the actual revolution, let us consider the various currents of thought and party organization of the intellectuals who were preparing for the coming conflict.

It is not necessary to dwell at any length on the Octobrists and the Cadets. The former drew their main strength from the provincial gentry and the Zemstvo institutions, the latter from the urban middle class and the liberal professions. The Octobrists pleaded for gradual development from local self-government, while the Cadets placed their hopes on the introduction of a constitutional democracy in which actual leadership would fall to the representatives of Western culture. The importance of far-reaching social and economic reforms was fully realized by the Cadets, and they were prepared to place them in the forefront of their political activity, but in spite of a recognition of the "four-tails" formula (i.e. universal, equal, direct and secret suffrage), the Cadets had no hold on the mass of the people, and relied on the selection of the educated by the uneducated.

Socially and psychologically, the leading groups of the years of upheaval were bound to come from the midst of the extreme revolutionary intellectuals, and it is to them that we have to turn our attention. Three leading currents may be distinguished in the history of revolutionary thought in Russia: militant idealism born of bitter resentment at the backward state of Russia in comparison with the West; the tendency to seek regeneration in a closer contact with the folklore of the common people; the economic materialism proclaimed by Marx and transplanted by various Russian thinkers. In theory, the views of the first group were most vividly expressed by writers like P. Lavrov and N. Mikhailovsky. The stress was laid by them on the propaganda of progressive ideas of European civilization among the intellectuals, especially among the youth, in order to form the minds of irreconcilable fighters for emancipation in all fields of human activity. Lavrov had initiated a philosophical theory (anthropologism) somewhat akin to the humanism of the modern pragmatic school; Mikhailovsky had preached "subjective" ideals with great effect as a journalist and literary critic. His violent radicalism was directed not only against the "powers that be," but also against agitation among the masses without corresponding enlightenment. He repudiated "class struggle" as a "school of bestiality," from which men issued as "live corpses with faces distorted by rage." In contrast to these "Westerners" appeared a group of writers who clung to the conception of a special aptitude of the Russian people for social brotherhood and communal economics (Zlatovratsky, Korolenko, Oganovsky, Kacharovsky): their antecedents must be sought in the romantic teaching of the Slavophiles as well as in emotional motives in sympathy with the toil and struggle of the peasantry.

In the case of active revolutionaries like Chernov, the radicalism of the Westerners was allied with the romanticism of the Populists, and in various combinations both tendencies helped to shape the views and the policy of the Social Revolutionary party. In the beginning of the 20th century one could distinguish some five groups representative of this party. The struggle with the Government in the first revolution (1905-6) welded these sets into a more compact body, the principal organ of which (the *Messenger of Revolutionary Russia*) proclaimed the necessity of a close alliance between revolutionary intellectuals,

conspiring proletarians and the struggling peasantry. As the programme of the Social Revolutionaries aimed at union between the classes in common opposition to the Government, it laid chief stress on political rights, democratic organization and the raising of the status and consciousness of the individual. Their methods of terrorism and insurrection were themselves the outcome of the heightened sense of personality and of the importance attached to energetic action and self-sacrifice.

The ways of the Social Democrats were different; they adopted Marx's teaching as a gospel and tried to develop and to apply it in every direction. Their chief exponent was for a time G. Plekhanov, a philosopher and economist who had taken up his residence abroad, in Switzerland and in Italy. He held strictly to the evolutionary construction laid down by Marx, according to which Capitalism appears as a necessary stage in the development of production and gives way to Collectivism only when the majority of the workers have been turned into wage-earning proletarians. Marx's principal disciple, Engels, had added that it would be the greatest misfortune for the working-class if it seized power before it had fully reached the stage of complete consciousness and Western organization. As a consequence of this, Plekhanov and his followers did not consider the Russian people ready for class war against the bourgeoisie, and insisted, on the contrary, on combined action with the social groups possessed of better education and greater political experience. Some Marxians went even further in the direction of compromise with the middle class and with the Government. For a time an "economic" orientation was very much the fashion; it discarded political action as untimely and hopeless, and insisted on "business" efforts for the improvement of the standard of living, increase in wages, industrial organization, better protection for the working-class, etc. The "Revisionist" movement, initiated in Germany by Brentano and Bernstein, found a wide field for application (Struve, Bulgakov, Prokopovich). Struve declared the formula of a class war to be a "myth," although he conceded it a certain value inasmuch as it helped to rouse the self-consciousness of the proletarians. Bulgakov analyzed the situation in regard to the distribution and cultivation of land, and came to the conclusion that the process of economic evolution consisted substantially in the gradual disappearance of brutal exploitation of human beings by fellow men; in industry this was effected by the concentration of production and increasing control, in agriculture by the breaking up of large estates and the strengthening of a class of prosperous husbandmen. Both movements converge in swelling the current of rising democracy.

The realities of Russian life did not prove favourable to a growth of these tendencies towards social peace. The burden of increasing taxation, the disastrous conduct of the Japanese war, the reactionary stupidity of the Government,—all contributed to revive the revolutionary spirit in the ranks of the Social Democratic party. The history of this revival may be traced from the appearance in Dec. 1900 of the *Iskra* (*The Spark*), a newspaper conducted by Lenin and Martov, supplemented by a monthly review *Zaria* (*The Dawn*) for more detailed exposition and argument. Lenin's pamphlets, *What is to be done?* (1902) and *Letter to a Comrade* (1903), express one of the leading ideas of his later activity. He pleads in them for centralized direction and decentralized responsibility, that is, for an oligarchy of leaders and strict discipline as regards the execution of their decisions by subordinate units. Democratic watchwords are set aside and efficiency of organization is demanded at all costs. This led to the disruption of the party. At the London Congress of 1903 the fateful division between "Bolsheviks" and "Mensheviks" was inaugurated, as a consequence of disagreement concerning the problem of leadership and discipline. The Bolshevik (meaning "Majority") group carried its proposals by a very narrow majority, and captured the Central Council of the party, from which they excluded entirely their opponents. The latter, who had a majority on the staff of the *Iskra*, proclaimed a boycott against Lenin and his adherents. The insignificance of the

immediate cause of the split was only apparent: in truth the division arose from fundamental opposition between the democratic orientation of Plekhanov and the oligarchical spirit represented by Lenin. The struggle was not suggested by a deep cleavage of principle among the rank and file of the party but by disputes among its intellectual leaders.

Questions of principle arose, however, in the course of the Japanese war and the first revolution. While Plekhanov and the Mensheviks were for coöperation with the Liberals in the fight for political freedom and for a gradual introduction of social reforms, Lenin set his hopes on the hatred of the peasantry for the landlords, and preached a ruthless *Jacquerie*. In his pamphlet, *The Agrarian Programmes of Social Democracy*, he contended that orthodox Marxians had failed to grasp the peculiarities of the Russian situation inasmuch as they were still talking about a coalition of the bourgeoisie of the towns, while in Russia the moving power was to be sought in the rising of the peasant bourgeoisie against the squires. He contrasted the abstract views of the town proletariat with the intense revolutionary temper of the peasants who were "ready to fly at the throat of the landlords and to strangle them." In his view the proletariat had to supply leaders and instructors when the revolution had been set going, but he looked to the exasperated peasantry for bringing down the existing order.

It is hardly needful to point out the close connection between these literary disputes and the Zimmerwald agitation<sup>1</sup> of 1915-16, as well as with the eventual overthrow of the old regime in 1917. Let us note that the Congress of the Social Democratic party in 1917 sided definitely with Lenin and the Bolsheviks.

*The Revolution.*—The situation in the beginning of 1917 was extremely tense and abnormal. The Emperor had left the capital and taken up his residence at the army headquarters in order to see as little as possible of the ministries, the Duma, or the Court, and to lead a "simple life" among the selected retainers of the Stavka; the Empress continued to look for hypnotizing inspiration to monks and priests and interfered constantly in affairs of State in favour of reaction. Even the staunchest conservatives, like Trepov, found it impossible to remain in office under such conditions, and the field was left clear for half-insane subjects like Protopopov and bigoted courtiers like Prince N. Galitsin. The army at the front held on sullenly to its positions, but was war-weary and distrustful of its leaders;

<sup>1</sup> The Zimmerwald Manifesto of 1915 is full of momentous declarations. The following are some of them:—

"The war that has produced this chaos is the outcome of Imperialism, of the endeavours of capitalist classes of every nation to satisfy their greed for profit by the exploitation of human labour and the treasures of Nature. . . .

"To raise welfare to a high level was the aim announced at the beginning of the war: misery and privation, unemployment and death, underfeeding and disease are the real outcome. For decades and decades to come the cost of the war will devour the strength of the peoples, imperil the achievements of social reform, and hamper every step on the path of progress. Intellectual and moral desolation, economic disaster, political reaction—such are the blessings of this horrible struggle of nations. . . .

"In this intolerable situation we have met together, we representatives of Socialist parties, of trade unions, or of minorities of them, we Germans, French, Italians, Russians, Poles, Letts, Rumanians, Bulgarians, Swedes, Norwegians, Dutch and Swiss, we who are standing on the ground, not of national solidarity, with the exploiting class, but of the international solidarity of the workers and the class struggle. . . .

"The struggle is also the struggle for liberty, for brotherhood of nations, for Socialism. The task is to take up this fight for peace—for peace without annexations or war indemnities. Such peace is only possible when every thought of violating the rights and liberties of the nations is condemned. There must be no violent incorporation, either of wholly or partly occupied countries. No annexations, either open or masked, likewise no forced economic union, that is made still more intolerable by the suppression of political rights. The right of nations to dispose of themselves must be the immovable fundamental principle of international relations.

"Since the outbreak of the war you have put your energies, your courage, your steadfastness at the service of the ruling classes. Now, the task is to enter the lists for your own cause, for the sacred aims of Socialism, for the salvation of the oppressed nations and the enslaved classes, by means of the irreconcilable class struggle."

the enormous levies in the rear provided crowds of conscripts, who resented the separation from their households and their land, chafed under the drudgery of stupefying training and swallowed eagerly the germs of insidious propaganda. The factory workmen in the towns were deeply affected by internationalistic and socialistic ideas, while the peasants were groaning under the heavy toll of conscription and the economic demands arising from a war which they had ceased to understand. Among the intellectuals there was a widespread feeling of uneasiness as regards the coming catastrophe: some were afraid of "cutting off the branch on which they were sitting," and many realized the madness of plunging into revolution in the midst of a war for existence. But the prevailing sentiment was despair as to any improvement under the reactionary Government. Even in Court circles the notion of a revolutionary movement was spreading rapidly, although, of course, officers of the Guards did not look further than to the elimination of Nicholas II. and of his spouse by a conspiracy similar to those which had put an end to the vagaries of Peter III. and of Paul. Such facts as Milyukov's scathing denunciation of the Empress Alexandra's protégé Stürmer (Nov. 1-14 1916), and the assassination of Rasputin by some aristocrats among whom there was a Grand Duke, Dmitri Pavlovich, showed that the indignation of upper circles of society had reached a revolutionary pitch. The Allied mission, in which Lord Milner represented Great Britain, left Petrograd just in time not to witness the explosion which everybody was expecting. But the decision came from below, and not from the stormy currents on the surface.

The principal centres of political agitation were the factories of Petrograd and the queues of householders and servants lined up for hours in sleet and snow at the doors of the bakers. It seems almost ludicrous now to consider the quest of food as one of the principal causes of unrest, but people did not realize then what might result in this respect from a disruption of orderly intercourse, and ascribed the scarcity of bread and the high prices to the inefficiency of the hated Government. Already in Nov. 1916 there had been talk in Petrograd of the imminence of a general protest strike. On March 8 1917, bread riots actually broke out, and on the next day (Friday) the streets were full of a surging mob which protested against everything. On the Saturday the police fired on the mob, and on Sunday troops used their weapons. Already on that day it was clear that part of the garrison could not be depended on. The Pavlovsky regiment of Grenadier Guards, after an encounter with rioters, in which it fired on the crowd, came back to barracks in a very ugly mood; the men declared to their officers that they would not help to murder their brothers in the streets. On Monday (March 12) the military revolt broke loose. The Volhynsky and Litovsky Guards marched against the Arsenal in the Liteynaya. They were opposed by some other troops, but before long one regiment after the other joined in the revolt, and by March 14 the principal positions in the town had been occupied by the rebels. The premier regiment of the army, the Preobrazhensky Guards, marched to the Taurida Palace where the Duma was sitting and placed itself at the disposition of its president, M. Rodzianko. An Executive Committee of the Duma was formed and subsequently a Provisional Government of members of all parties except the extreme Right (Prince Lvov, Milyukov, Guchkov, Shingarev, Tereshtchenko, Nekrasov, Godnev, V. Lvov, Manuilov, and Kerensky). At the same time another centre of authority was set up at the Smolry Institute, where a Council of Workmen's delegates appeared. It represented the factory workmen, artisans and various nondescript elements which had taken part in the Revolution and claimed a share in the reorganization of the country, and it was joined by representatives of the soldiers.

On March 15 Nicholas II. abdicated in favour of his brother Michael, who, however, declined to ascend the throne unless invited to do so by the will of the nation. In less than a week the mighty Imperial power of the Romanovs had been overthrown almost without bloodshed. All the commanders of the armies in the field and the governors of provinces, including the

Grand Duke Nicholas, Viceroy of the Caucasus, hastened to promise loyal support to the new Government.

*Discordant Tendencies.*—People were elated in those days. Even statesmen and historians were carried away by the general rejoicings over the newly acquired freedom of Russia. Nothing seemed impossible to the great nation which had come to its own after centuries of bondage. And yet it was evident that a task of superhuman magnitude had to be faced. The story of the "Zauberlehrling" was repeating itself: the pupil of the magician had succeeded in calling up the waters of the deep, but did not possess the word capable of arresting them, and they rose and flooded the place, and drowned the unfortunate amateur in witchcraft. The party leaders thought that the Revolution could be directed by programmes and compromises. In reality the Revolution meant the overthrow of all accepted creeds, morals and habits of the people, a confusion of their entire nature in which, for a time, nothing could be relied upon—neither duty, nor humanity, nor affection. A people renowned for its Christian spirit and stubborn patience gave vent to outbursts of bestial lust and cruelty, to hysterical moods of blind selfishness. Even those of the leaders, who had apprehensions as to the effect, consoled themselves by comparisons with the French Revolution, as if the French Revolution had to deal with cultural problems of such complexity as the Russian one, or had challenged the existence of the educated class.

The history of the Russian Revolution starts with the gradual dissolution of all fundamental institutions and notions. The first to go was the army, as it was the most tangible and irksome form of State organization. The first act of the Soviet of Workmen was to issue an order to all army units enjoining the formation of Soldiers' Committees to watch over the behaviour of officers, to take over arms, etc. It is to be imagined what effect this order exercised on the discipline of the army. The patriotic Minister of War in the Provisional Government, A. Guchkov, strove might and main to stop the disintegration of discipline, the fraternization with the enemy, and the cowardly desertions. He called up a legendary hero of the war, Kornilov, and placed him at the head of the Petrograd garrison. But all these efforts were of no avail in the face of the disorganization of the soldiery; the adulation of the demagogues, the propaganda of German and native Defeatists, and the regime of Soldiers' Committees was substituted for hierarchical command. In April Kornilov left for the front in disgust, and in May Guchkov resigned in despair.

Next came the turn of foreign policy. The mob, led by the Council of Workmen and Soldiers, was repeating the magic formula of "peace without annexation and indemnities." How could fidelity to the Alliance concluded in the fateful months of August 1914, how could the aspirations towards a command of the Straits or any other aims of Russian national policy be made to square with this abstract, colourless formula, devised at Zimmerwald by the enemies of European civilization?

The extremists in Russia took a perverse delight in ignoring completely the menace of German domination, and dreamed, or pretended to dream, of a rising of the German Socialists that would substitute class war for the struggle of empires. The Minister of Foreign Affairs, Milyukov, was not willing to dissociate himself from the Allies and to disregard the German danger, nor was he prepared to tear up as a scrap of paper the agreement concluded with much difficulty by Sazonov, in which the Western Powers had acknowledged the justice of Russia's claim to Constantinople and the Straits. He had to retire, because the mob did not want to go on with the war and cared nothing about the Allies or about Imperial interests of Russia, while those who pulled the strings behind the scenes kept in touch with the Germans and were bent on the destruction of historical empires in accordance with Zimmerwald policy. After stormy demonstrations Milyukov resigned.

Even worse than these ministerial changes was the displacement of the centre of gravity in the political world. The Duma was set aside by the appointment of the Provisional Government. As the Duma had been elected on a narrow and artificial

franchise, it carried no weight with the people. Its Executive Council could not find its right place by the side of the Provisional Government, and looked helplessly on the latter's efforts to assume authority. An attempt was made to summon the members of all the four Dumas to a kind of political conference, but this only led to a good many speeches without any practical results. The four Dumas in conjunction looked even more like ghosts than the fourth one by itself. This meant that a number of influential public men—Rodzianko, Shidlovsky, Shulgin, Maklakov, N. Lvov, Karaulov—vanished into oblivion, some for ever, others at the most critical moments of the incipient Revolution. The Provisional Government was left in isolation in the face of a seething mass of half-educated people, who had lost all sense of duty and all respect for authority. This would have been bad enough in itself, but the Provisional Government had to reckon not only with these heaving throngs but with a rival and energetic organization—the Soviet Workmen and Soldiers.

The resignations of Guchkov and Milyukov rendered necessary a reconstruction of the Provisional Government, and it was effected in the direction of the Left. The outstanding facts in this reconstruction were the appointments of Kerensky as Minister of War and Marine, the Social Revolutionary Chernov as Minister of Agriculture, the Social Revolutionary Skobelev as Minister of Labour. Prince Lvov was kept president of the Council, but he was not much more than a figure-head: the principal personage in the new combination was A. F. Kerensky, while the appearance of Chernov and Skobelev as members of the Government showed that the country was to be subjected to socialistic experiments of the most extreme kind. The dykes had burst and torrents of disorderly agitation were let loose on the land. The composition of the new Ministry was intended to bring some harmony in the action of the two rival centres, the Ministry and the Council of Workmen and Soldiers, to which a third element, delegated from the peasants, had been added. In practice the Government was made amenable to the direct influence of the council, whose aggressive Socialism was not tempered by any sense of responsibility. At its head stood a characteristic figure Cheidze, a Georgian Social Democrat, who hated everything that savoured of Russian national tradition. He had nothing to recommend him as a political leader except his stubborn opposition under the old regime. His election to be chairman of the Soviet, showed that the men, who were ready to discard all bonds of national honour and self-preservation for the sake of peace at any price, had the masses behind them.

The most terrible symptoms of the advancing disease was the arrival from abroad of Bolshevik leaders—Lenin coming through Germany, under the benevolent protection of the Kaiser, and Trotsky arriving from America. These men were resolved to preach the doctrine of Zimmerwald and Kienthal. Their zeal did not cool down in Russian surroundings. Riazanov demanded that deserters should be free from punishment for the sake of individual freedom. Steklov incited soldiers and citizens to kill generals suspected of counter-revolutionary designs without further inquiry. The weak spot in the armour of Russia had been discovered. A hysterical stampede began which spread rapidly from the rear to the front, and it is not a paradox to say that the Government was powerless against this organized disorganization: the Soldiers' Committees at the front acted systematically against the officers, fraternization with the enemy was encouraged by many of them, and when it came to a fight, they debated for hours whether they should obey orders or leave the line. In case of serious onslaughts on the part of the Germans and the Austrians, whole regiments gave way. The state of the army was depicted in the most mournful colours by no less a man than that great citizen-soldier of Russia General Alexeiev:—

"Let us be frank; the fighting spirit of the Russian army is exhausted. But yesterday stern and powerful, it now faces the enemy in a trance of fatal inaction. A longing for peace and quiet has replaced the old traditional loyalty to the country. Base instincts of self-preservation are reawakened. Where is the powerful authority at home for which the whole State is yearning? We are told it will come soon. But we do not see it yet. What has become of our love

for the Mother country? Where is our patriotism? The sublime word of brotherhood is inscribed upon our banners, but it is not written in our hearts. Class antagonism is raging in our midst; whole classes who had honourably fulfilled their duty to their country are placed under suspicion. As a result a deep abyss has yawned between soldiers and officers."

In front of this disruption of moral ties the reproaches and warnings of progressive leaders who had not lost the sense of their allegiance to the Motherland did not avail, and yet among these patriots there were many who had passed their lives in prison and exile for the sake of their opinions—Plekhanov, Krapotkin, Breshkovskaya, Herman Lopotin.

*Kerensky's Rule.*—The most conspicuous, although by far not the most worthy representative of the "Defencists," was the favourite of the Revolution, the new Minister of War and Marine, A. F. Kerensky. None had thundered with more effect against the oppressive measures of the old regime, none could speak with such enthusiasm, of freedom, the sanctity of revolution, popular inspiration, the right of the masses, and the dawn of a new era. Unfortunately, impassioned feelings and eloquent words do not serve as substitutes for statesmanlike foresight, clearness of purpose, and strength of will. After attaining to a unique position at the head of revolutionary Russia Kerensky entangled himself in a net of contradictory measures, of ill-judged assertions of authority, and of weak-minded compromises and renunciations. With incredible levity and conceit he assumed that he could, by his personal magnetism, repair the harm which was being done to the army by the propaganda of Defeatists. He rushed from corps to corps, harangued soldiers' meetings, revelled in their applause, and believed that he had achieved wonders by his appearance at the front. Witnesses of these meetings did not fail to notice that the soldiers, after listening with some interest to the new kind of theatrical performances, did not conceal their incredulity as to results. These results were disclosed in a manner which did not admit of any doubts when the time came for testing the effects of this oratorical campaign in a struggle with the enemy.

Towards the beginning of July 1917 a general offensive movement was attempted, in the hope that the gallantry of specially formed shock battalions would kindle the fighting spirit of other troops, and that the whole line would advance and break at least the thoroughly shaken Austrian army. The first onslaught in the south-west was successful; Kornilov's shock troops pushed as far as Stanislaw (Stanisławów) in Galicia. But it was the last flickering flame in the case of an army disintegrated by defeatist propaganda. In the north the ordinary troops refused to support their comrades and looked on with irony at their desperate efforts against heavy odds. In the midst of the fighting a general *débâcle* began: the Russian regiments rolled back in disorderly retreat, and the only fact which prevented an immediate collapse was the extreme weakness of the enemy on the Austrian front.

The Russian nation, as represented by its army, had definitely succumbed in the great struggle. Even more terrible perhaps than the defeats at the front was the corresponding chaos in the country. A Separatist disaffection in the Ukraine seized the opportunity presented by the great catastrophe to assert claims as to an independent Government, based on the fact that the provinces on both shores of the Dnieper had for some centuries formed part of a Cossack republic and of the Polish-Lithuanian State. The fundamental unity of the Russian people, as well as the immense benefits brought by the reunion in the 17th century and the common progress in the 18th and 19th centuries, were set at naught by these people. The bulk of the Ukrainian population would not have followed them, in spite of many grievances against Petrograd rule, if it had not been for the hysterical stampede of the Revolution. As it was, people dreamt of a new heaven and a new earth in Kiev and in Poltava, as well as in Petrograd and in Moscow, only with the difference that their visions were reminiscences of Cossack prowess and licence. The representatives of the Provisional Government—the romantic socialist Tsereteli, the wealthy amateur Tereshchenko, the shifty intriguer Nekrasov—were not able to make any stand

against such treasonable pretensions, and conceded an autonomy bordering on complete separation. Some of the Cadet members of the Provisional Government—Prince Lvov, and Shingarev—protested and resigned, but their withdrawal was hardly noticed. Kerensky was placed definitely at the head of the Government and continued his campaign of eloquent appeals.

In the general confusion the group of relentless realists, the Bolsheviks—thought the moment opportune to show their hand. On July 14 a military revolt broke out in Petrograd: regiments converted by the extremists—the first machine-gun regiment at their head—seized strategic points in the capital; cruisers and destroyers flying the black and red flag of terrorist Revolution came into the Neva from Kronstadt. For three days it seemed doubtful whether the Provisional Government would be able to hold its own. The attempt was, however, somewhat premature. Part of the Petrograd garrison remained passive, and this made it possible for some loyal troops to suppress the rebellion. The Government was afraid, however, to strike hard: Trotsky, Lunacharsky and Kamenev were let out after a brief arrest; Lenin had disappeared as soon as it became evident that the outbreak had miscarried. Apart from the usual irresolution of ministers who had not learnt to govern during their long apprenticeship in the ranks of a critical Opposition, the hands of the Executive power were tied by the pressure from the Soviet of Workmen, Peasants and Soldiers. The Social Revolutionaries and Social Democrats, although disagreeing with the Bolsheviks and afraid of them, worshipped the word "Revolution," and were loth to adopt coercive measures against their comrades of the extreme Left. Stern measures against the extremists might have seemed a return to the oppression of the Tsarist regime, and the Socialists preferred risking their own safety to the danger of being accused of the crime of "*lese-Révolution*."

So the see-saw of contradictory decrees and measures continued for some time. While the military chiefs addressed passionate appeals to the Government for a restoration of discipline, for stern punishment of deserters, for abolition of the political authority of the Army Committee, Socialists, even moderate ones, defended the "new discipline" of the noble revolutionary army, minimized its defeats and demoralization, and consoled themselves with the prospect of a rebirth of the nation under the mighty influence of the revolutionary spirit. In the meantime, the peasants were grabbing the estates and the live stock of the squires, burning houses, and killing some of the unpopular owners. The Minister of Agriculture, Chernov, looked upon this lawlessness of self-help as a perfectly natural outbreak of the policy of expropriation. The factory workers and workshop artisans in the towns were not less insistent in the assertion of their rights; wages went up by leaps and bounds, while the work done became more and more careless and casual. Owners and engineers were sometimes thrown out of their establishments, seized by the proletarians. It happened, indeed, that after trying their hand at management for some time the workmen requested or compelled their former employers to return as managers, but such isolated cases did not counter-balance the general effect of disorder and slackness. The decay of Russian industries was proceeding fast. The efforts of military chiefs and responsible leaders to arrest the spread of treason, disorganization, and demoralization were denounced by the Socialists of the Soviet and their representatives in the Provisional Government as counter-revolutionary attempts.

*The Second Revolution.*—Prince Lvov recognized that it was no longer possible for Liberals to work with Chernov and his companions. He resigned from the premiership, and the Cadets in the Ministry followed him. Kerensky became prime minister. Although he retained the portfolio of War and Marine, he set himself the task of constructing a "strong revolutionary" Government. In order to find a basis for a national coalition he called a conference in Moscow, in which all classes, groups and principal institutions of the Russian State were to be represented. The Bolsheviks refused to take part and ridiculed the idea of a congregation of that kind. On Aug. 26 about 2,000

delegates met in the Grand Theatre, representatives of the various parties, of Zemstvos and municipalities, of universities, of army, of factory workmen, of peasant communities, etc. The meeting might have been a first step towards the regeneration of Russia, if the leaders had clearly realized that the danger did not lie in counter-revolution but in disorganization. But Kerensky opened the discussion by a speech in which warnings as to the danger to the country were intermixed with the usual revolutionary catchwords, and no lead was given in the direction of any practical reform. Kornilov, as commander-in-chief, delegates of the officers, and many of the former political leaders, spoke strongly of the necessity of reestablishing discipline, of a strong executive, of national work to be carried on by all parties and classes. But the delegates of the Left, who were in the majority, not only turned a deaf ear to all such exhortations, but manifested openly their contempt and dislike for the old ideals of patriotism. Among the worst were the soldiers delegated by various army committees. The whole attempt was a failure; instead of bracing up the political consciousness of the nation it revealed a state of complete paralysis on the part of the so-called rulers of the country.

At the beginning of September Riga fell, after a half-hearted and disconnected defence by the XI. Army. In the Soviet, Tseretelli tried to bring through the reintroduction of capital punishment for treason and desertion, and although he succeeded in collecting a narrow majority, this measure, insisted upon by the officers, was nullified by motions in the opposite direction—for example, by a demand that the arrested Bolsheviks should be liberated. It was evident that no serious effort to arrest anarchistic effervescence could be expected either from the Provisional Government or from the Soviet: they felt spellbound as soon as the sacred word "Revolution" was pronounced by the enemies of the State. The commander-in-chief, Kornilov, was not the man to submit meekly and without a struggle to the fatal policy of drift. He threw his authority into the scales against social disorder, and tried to force the Provisional Government to side with him. With this object in view he ordered some cavalry divisions on which he could rely to march toward Petrograd. He began negotiations with Kerensky through the medium of Boris Savinkov, a Social Revolutionary and active terrorist, who was acting as Assistant Minister of War at the time. This is how Savinkov related the main occurrences of this momentous crisis:—

"When, on the 5th-6th of September, at Headquarters I again told him that in the near future the Provisional Government would examine the bill which was being prepared by the order of the Prime Minister, for the measures to be taken at the base, he believed that the Government was no longer hesitating, and when bidding me farewell on the 6th of September at Headquarters he declared that he would give full support to the Prime Minister, for the good of the country. On my return to Petrograd I reported my conversations with General Kornilov to the Prime Minister, and on the evening of the 8th of Sept. the bill for legalizing measures at the base (*i.e.* severe penalties for breaches of discipline) was to have been examined by the Provisional Government. But on the 8th of Sept. I was summoned to the Winter Palace, and the Prime Minister told me something that was a complete surprise to me. He told me that V. N. Lvov had come to him with an ultimatum from Gen. Kornilov, who demanded that the supreme authority should be given over to the Commander-in-Chief, with all military and civil power over the country, and that he, the Commander-in-Chief, was to form a Cabinet in which I was to be Minister of War and the Prime Minister was to be Minister of Justice. The ultimatum was in writing, but was signed, not by Gen. Kornilov, but by V. N. Lvov himself. Then the Premier called Kornilov up on the Hughes apparatus, and asked him without reading out to him the text of the declaration signed by V. N. Lvov—whether he was ready to sign the ultimatum presented by V. N. Lvov. Gen. Kornilov replied, 'Yes, I am ready to sign.' On the same day (8th of Sept.), the Prime Minister sent a telegram to Gen. Kornilov at Headquarters, demanding that Kornilov should immediately give up his post and leave the army." (Tyzkova-Williams, 214, 215.)

Kornilov's attempt to assume power was obviously conducted in a very clumsy manner: he was not a statesman, but a soldier, and the people around him were in no way able to make up for his deficiencies in political training. It is almost inconceivable how he could have chosen as his messenger the half-witted

V. Lvov. But, apart from that blunder, the chief advisers of Kornilov, were Zavoiko, a minor bureaucrat of the old regime, crafty and plausible, but devoid of insight and authority, and Aladine, a noisy half-educated demagogue, a member of the First Duma, who had turned Nationalist and had nothing to recommend him but his posing as the mouthpiece of the secret diplomacy of the Entente. However this may be, the intended *coup d'état* miscarried completely and made the situation only worse. Kerensky assumed the part of a heroic defender of the Revolution against a military conspiracy, all the various Socialistic groups joined him in the outcry against the would-be dictator, the army did not rise to support the general, who wanted to reestablish discipline and unity of command, the leader of the cavalry corps, which had advanced to the outskirts of Petrograd, shot himself, and Kornilov and his principal supporters—Danikine and Lukomsky—were arrested and charged with treason. The outcome of the whole affair was a recrudescence of revolutionary zeal, and a violent rush to the Left. In the country the panic produced by Kornilov's attempt expressed itself in wholesale massacres.

The victorious Kerensky did not realize that he had thrown away the last chance of salvation from the rising tide of anarchy and terrorism. He appointed himself commander-in-chief and imagined that he was strong enough to defeat the onslaught from the Left as well as from the Right. Yet he received warning after warning of the crumbling away of political organization. The central executive of the Soviet had been effected by the landslide towards the Left. They called a Democratic Conference in Petrograd from which all bourgeois elements were excluded: the membership was restricted to delegations from Soviets, trade unions, cooperative societies and peasants' communes. This Assembly, in which the various Socialist groups had entirely their own way, could not even agree on a resolution calling for a Coalition Government capable of defending Russia in the hour of supreme danger. A motion in the sense was first passed and then rejected in consequence of the reluctance to admit Cadets and adherents of Kornilov to any share in the Government.

In contrast with this confusion of ideas and lack of resolution the extremists were quite clear in their minds, and the snake of Bolshevism was lifting its head again. Trotsky, who had been let out of prison, was more popular than ever, when he discoursed on the necessity of forming a Government of the Soviets and appealing for peace to the proletarian masses of the world. At the new elections to the Executive of the Soviets of Workmen, Peasants and Soldiers, he was elected President against Chaidze. This meant that the dualistic system was recognized to be obsolete, and the Provisional Government with Kerensky at its head was to be discarded in favour of a concentration of power in the hands of the Extremists. A motion condemning Kerensky and his Government was passed by the Soviet Executive.

Kerensky tried to parry the blows by supplementing a tottering Coalition Ministry with a Council of the Republic composed of representatives of all the political parties, principal associations and institutions. This body met at Petrograd on Oct. 20. It gave a measure of its capacity for political action by starting a long discussion on the question of the active or passive defence of Russia against the ever-increasing German menace. Although the Bolsheviks ostentatiously left the Council as a protest against the presence of "bourgeois" elements and the "counter-revolutionary" policy of the Council, the remaining parties were unable to agree on any definite and patriotic motion. The Internationalist delusions of many Socialists were strong enough to prevent any firm declaration directed against the Germans. Five motions were made, and all five were rejected one after the other. Defencists like Plekhanov were powerless against the Internationalists led by Martov.

*The Bolshevik Usurpation.*—The time of the Bolsheviks had come. In the first days of Nov. 1917 the Soviet under Trotsky's leadership formed a military Revolutionary Committee, and on the 3rd, the authority of that Committee was recognized by the Petrograd garrison. Then steps were openly taken

to form an armed force dependent on the Soviet and independent of the Provisional Government. By the side of this force, which was considered not to be entirely trustworthy, the sailors of the Baltic fleet could be counted upon implicitly: they had long ago thrown in their lot with the advocates of civil war and terrorism. Kerensky assured his ministers, and proclaimed loudly to the population that he had taken the necessary measures to suppress any attempt at a revolt. In reality he had no troops at his disposal except a couple of battalions of military cadets and one company of women. The commander-in-chief of the Russian army relied on speeches against machine-guns, as the Chinese generals of 1860 had relied on painted dragons against the rifles of the English and French expeditionary force. The result was a similar one. On Nov. 7, Bolshevik sailors surrounded the Winter Palace, and after a brief scrap with the women arrested the ministers, the premier and commander-in-chief having disappeared in good time. A lieutenant with some soldiers drove out the Council of the Republic. The Cadet battalions were overpowered, and their remnants massacred by the soldiery and the mob. A small force of Cossacks under Gen. Krasnov skirmished for a few days against the sailors and armed workmen on the outskirts of Petrograd, but eventually concluded an armistice and withdrew. In Moscow the struggle was fierce, and Cadets held out for some time in the Kremlin together with a few loyal battalions. But there, too, defenders of the Government submitted to superior gun-power, lack of supplies and the discouraging influence of discussions and treachery. All along the front the demoralized soldiery rose against their officers and massacred them in the name of the Revolution. The commander-in-chief at headquarters, Dukhonin, was dragged out by a mob of soldiers and murdered.

The first act of the Bolshevik dictators was to satisfy the craving of the masses corrupted by them: private property was abolished, with the reservation that the land of the peasants and Cossacks was not to be confiscated. At the same time the new Soviet Government addressed to all the belligerent States the proposal to conclude peace. The Entente Powers were invited to join in direct negotiations with the Central Empires; failing this, Soviet Russia would conclude a separate peace. The advanced Socialists had no scruples as to the "letting down" of Allies who had been struggling for three years against the German Junkers; what they were chiefly afraid of was an Allied victory.

The same contempt for truth, duty and justice, was displayed in the domain of home politics. The *coup d'état* had left one institution still standing—the Constituent Assembly in process of formation. The Bolsheviks had clamoured for its immediate convocation, and accused all the parties with the criminal design of delaying or preventing its meeting. They were now at the head and could not forthwith stop the elections. These had been prepared laboriously by idealistic doctrinaires—by staunch believers in universal, equal, direct, and secret suffrage. All citizens of both sexes who had attained the age of 20 were to take part in it. To make the arrangements absolutely perfect, the principle of proportionate representation had also been introduced in a somewhat peculiar form. The various parties were to present lists containing as many names as there were seats allotted to the electoral district. The attribution of these seats to the parties was to be made in proportion to the number of votes cast in support of each list, the candidates taking places in the order of their seniority in the parties nomination. The absurdity of these mechanical devices had been already demonstrated by the municipal and rural elections, but the defects of the latter were greatly intensified in the case of the Constituent Assembly. Ignorant peasants were led off to record their votes for long lists of men whom they did not know and in support of platforms they did not understand. The extreme parties did not shrink from any kind of violence and fraud to bring in their nominees. Nevertheless, some sort of elections were actually held, right in the midst of revolutionary chaos, in the months of Nov. and Dec. The result was that the Social Revolutionaries got a large majority, thanks to the votes

of the peasantry, while next came the Bolsheviks, who drew their chief support from the workmen in the towns and from the soldiers. The Mensheviks and the Cadets came in with negligible numbers, the latter with 15 out of a total of 600.

The Bolsheviks were not satisfied with such results. As soon as it became clear that they had not won in the gamble for votes, they began to revile the "parliamentarism" of the Constituent Assembly and of all national organizations as opposed to class groups. When the members of the Constituent Assembly came to Petrograd, and tried to get into the Taurida Palace, they were met by armed guards and ejected from the building. Leading members of the Cadet party, Countess S. Panina, Shingarev and Kokostsev, were arrested as "enemies of the people" and thrown into the dungeons of the Fortress of St. Peter and St. Paul. An order for the arrest of Chernov and Avksentiev was also issued, but they could not be found. At last, on Jan. 18 1918 the opening sitting of the Constituent Assembly was held. Trusty heroes from the Kronstadt fleet, with loaded rifles, surrounded the deputies from all sides; the galleries were packed with a howling mob. In spite of this, the election of the President resulted in a defeat for the Bolsheviks and the Social Revolutionaries of the Left allied with them. Their candidate, Marie Spiridonova, received 158 votes against V. Chernov, who got 244. Nor did the Assembly consent to register all the decrees handed in by the Bolsheviks and to abdicate its legislative power in favour of the Soviets. The armed rulers were not disposed to bow before the recalcitrant Assembly. After sitting one day, it was dissolved and ejected from the Taurida Palace.

By way of justification for this act of treacherous violence, it was maintained that the Constituent Assembly did not reflect the "will of the Revolution," that the "masses" had moved away from the standpoints represented by the party lists, and that, altogether, "formal democracy" has no right to decide in times of Revolution: the leadership ought to belong to the advanced organizations conscious of their aim and intent on achieving it. It was not difficult even for "nebulous" Social Revolutionaries of the Centre and Right to refute these sophisms. They urged with perfect truth that the will of the Revolution in this case meant simply the arbitrary sway of a gang of reckless adventurers, that the Assembly, in spite of all its defects, was the one authorized institution entitled to speak for Russia, an institution which had been recognized and made use of by the Bolsheviks as long as it suited the purposes of their propaganda. But what force had arguments in the face of rifles? The soldiers had run away from the front in order to rob and kill in the name of the Revolution: no one was ready to satisfy and to glorify them to the same extent as the Bolsheviks. Hence there was ample "pragmatic" justification for the Bolsheviks' *coup d'état*. Naturally the first acts of the new era were decrees of the Executive Council proclaiming the abolition of private property and the resolve to conclude a democratic peace.

*Peace of Brest Litovsk.*—Two parties were necessary in order to conclude that honourable peace "without annexations and indemnities" which the Bolsheviks announced before having informed themselves of the views of the other party as to the conditions of such a peace. Lenin, Trotsky, Zinoviev and their colleagues had, however, made up their minds about certain points, so that the ordinary negotiations were for them only a formal act, attractive in so far as they enabled their *sans culotte* delegation to exchange salutations and to sit at the same table with the diplomatists and soldiers of powerful empires. The Bolsheviks had long ago made their choice between the belligerents; they expected and preferred the victory of the Germans, who had served them and provided them with funds in the hour of need. Hypocritical invitations to the Allies to follow in their wake at Brest Litovsk could deceive no one as to their choice. And as they had done more than anyone to corrupt and disband the Russian army, they knew perfectly well that they had nothing to oppose General Hoffmann, when the latter chose to "bang his boot on the table" (Trotsky). Some show was made in their newspapers of strikes in Austria and in Berlin, but it was clearly a case of discussing terms with an opponent who

had disarmed you and may dispatch you at his pleasure. No wonder that Baron Kühlmann, after accepting the formula of an honourable peace "without indemnities and annexations" on the basis of the self-determination of peoples, required the representatives of the Soviet Republic to cede Poland and Courland to the Central Empires, to recognize Finland, Estonia and Latvia as independent States, to give up the Ukraine on both shores of the Dnieper, and to pay a contribution of 300 million rubles. Trotsky tried to get away with a theatrical gesture; he and his colleagues declared that they could not sign such a humiliating peace, and they departed in noble style. Even this little pretence was not vouchsafed to them. General Hoffmann ordered some German divisions to advance, and the revolutionary army was at once on the run. The delegation of Soviets had to come back crestfallen and to sign a second more dishonourable edition of the Treaty of Brest Litovsk. Lenin was in no way disturbed: he explained to the Third Congress of the Soviets that the Germans had their knees on Russia's chest and that it was no use struggling. Breathing space must be had at any price, in the hope of a further fulfilment of Zimmerwald predictions. The Congress ratified the Brest Litovsk document by a large majority, and a German envoy, Count Mirbach, was sent to Moscow to watch over the exact fulfilment of conditions by the vanquished. Trotsky, who is particularly fond of repeating, at every turn of his account of these affairs, such phrases as "we know" or "we expected," may well claim that this degradation had been foreseen and to a great extent brought about by his party. But the breathing space required by Lenin was provided, not by the Brest Litovsk peace, which was the opening move for the complete enslavement of Russia by the Germans, but by the unexpected fact that the Allies did not succumb, in spite of the treacherous conduct of the Bolsheviks. The Marxist prognostics of the victory of Germany as the nation best organized in a technical and economic sense was shown to be fallacious. The staying power of the Austrian, Bulgarian and German armies proved to be less than that of the soldiers of France, Great Britain and the United States. The victory of the Allies saved Russia from the consequences of Brest Litovsk.

*The Rule of the Communists.*—In spite of the fact that the elections to the Constituent Assembly had resulted in an overwhelming majority for the Social Revolutionists, the drastic way in which Lenin and his companions had satisfied the popular demands for peace at any price, for land and for proletarian privileges, ensured to them the more or less fervid support of the masses. The lower classes enjoyed the defeat and humiliations of their betters even apart from direct advantages and even at the cost of some discomfort for themselves. The pent-up resentment and envy of generations found vent in acts of brutal violence and disorder. It was pleasant to see maids of honour sweeping the streets, and generals insulted and sometimes murdered by their soldiers. We are told of cases when the descendants of serfs dug out the skeletons of their former masters from their graves and threw them into sewers. It was an act of frenzy on the part of revolted slaves when the commander-in-chief, Dukhonin, was torn to pieces at his headquarters and Ensign Krylenko installed in his place, or when, later, the heroes of the great war—Ruzsky and Radko Dmitriev—were massacred in Piatigorsk because they did not truckle under the threats of the disbanded soldiery. The officers slaughtered in Helsingfors, in Kronstadt, in Kiev, in Sevastopol, paid with their blood for the disaster of Tsushima, the Sukhomlinov misrule, the cruel discipline of the Old Army. As a result, Bolshevik domination spread over the land like a forest fire, and all attempts at resistance proved unavailing against its elemental progress. The cadets of the military schools of Moscow held the Kremlin for a few days with great gallantry, but they were betrayed by the head of the Moscow garrison; he surrendered them to the Communists "for the sake of peace." Occasional resistance in other towns was put down with even greater ease. The personnel of many administrative institutions went on strike, and attempted to stalemate the usurpers by refusing to serve under them: the strikers were reduced to obedience after a couple of months by

the necessity of earning their bread somehow. Countess Panina, one of the most enlightened and public-spirited Russian women, had acted as Assistant Minister in Kerensky's last Ministry: she was thrown into prison for having supported this strike movement, which the Bolsheviks treated as a "sabotage" of Government services. She was eventually released, but two among the most idealistic, most self-sacrificing of the Liberals who had taken part in the Provisional Government, Shingarev and Kokoshkin, fell victims to a dastardly gang of murderers in a hospital where they had been lodged on account of illness.

The only serious attempt to oppose armed resistance to the bandits was offered by Gen. Alexiev and the indefatigable Kornilov. They collected a few thousands of devoted men, most of them officers, formed them into improvised units, and took the field against the Bolsheviks in a far-off corner of the empire in Northern Caucasus. Kornilov fell in the unequal struggle, but his comrades succeeded in building up gradually a "Volunteer Army" which held its own in the Kuban territory. It was too weak to advance because the Cossacks, instead of joining it with all their forces, wavered and negotiated. Hetman Kaledin, a brilliant general who had won conspicuous distinction in Brusilov's campaign of 1916, was so grievously affected by this lack of patriotism that he committed suicide; and his successor, Krasnov, preferred to enter into an agreement with the Germans, who were spreading their tentacles from the Ukraine to the Donets and to the Volga.

The rise of the revolutionary tide was, however, not a constant and unbroken process. The shattered forces of the past did not give way without repeated attempts to reassert their vitality. The Orthodox Church that had grown up with the Russian people in its hard struggle for existence could not be reconciled with the rule of aggressive materialists. Everywhere the clergy exerted its influence publicly and secretly against the anti-Christian rulers. Tikhon, the newly appointed Patriarch of Moscow, whose chair had been set up again by a national Council of the Orthodox Church after an interval of 200 years of Babylonian bondage to lay bureaucracy, denounced and anathematized the Communists. Everywhere processions and ceremonies recalled to the popular mind the ancient traditions of creed and ritual, and even the most hardened among the rioters and deserters responded at times to these emotional appeals. The Bolsheviks turned sanctuaries into public halls, desecrated revered shrines, tortured priests and shot bishops, but these persecutions strengthened the moral hold of the Church on the flock, purified the sunken priesthood by a new baptism of blood. Among the Intellectuals themselves, religion regained many adherents, and men like Eugène Trubetskoy or Bulgakov, who had stood up for Christian ideals in the days when it was considered ridiculous for an educated man to do so, found themselves at the head of a powerful movement.

The Liberals also did not give up the struggle. A number of more or less secret associations sprang up. The Press was being gradually gagged by the Bolsheviks, but these associations continued their underground existence in spite of the espionage and arrests. The most influential were the Radical League of Reconstruction (*Soyuz Vozrozhdenia*) led by Avksentiey and Argunov, the "Centre," composed of Cadets and Left Octobrists with N. Astrov and N. Shchepkin at their head, and a union of the Rights whose principal leaders were Krivoshein and Gourko. The question of yielding to the Germans and crushing the Communists with their help was eagerly discussed in connexion with the plan of a monarchical restoration. The idea found favour among the Rights and was supported among the Cadets by P. Milyukov, who had fled to Kiev, and considered that the game was definitely lost by the western Allies and that it was wiser to accept defeat from the Germans than from the Bolsheviks. This view was, however, decisively rejected by the Liberals and the Radicals, who remained staunch in their allegiance to the Entente and could not bear to think of German domination. The chastisement for this independence of mind followed closely upon the offence: the Cadets had held a conference in Moscow on the political situation on May 13, 14 and 15,

and had endorsed the policy of their leaders to remain faithful to the Entente: on May 17 their various centres were raided and many representatives arrested. Others fled south and east, but Moscow was still the nucleus of a "National Centre."

*Policy of the Allies.*—How did the Entente Powers react against the disruption of their alliance with Russia? Their ambassadors, having watched with anxiety the decay of the monarchy, offered ineffectual advice, and informed their Governments of the precariousness of the situation without being able to suggest any effective course of policy. When the blow fell, the Entente Powers accepted the verdict of the Revolution as a necessary consequence of Tsarist misrule, and the President of the United States actually felt more free to join the western coalition, since the danger of a victorious advance of Tsarism had been removed. The device of a double diplomacy was adopted: while Sir George Buchanan and M. Noulens continued officially to represent Great Britain and France, special envoys were dispatched to Petrograd as emissaries of various groups of Socialists faithful to national traditions. Arthur Henderson for Great Britain and M. Albert Thomas for France were even entrusted with official missions. The main object was to steer the Russian Revolution into a warlike course, to keep up the eastern front, and to provoke a resumption of the Russian offensive. The results of this unusual diplomacy were very heterogeneous. While Albert Thomas eagerly supported Kerensky in his patriotic appeals to the army, as well as in his attempts to arrange a coalition with the Soviets, Arthur Henderson became convinced of the urgent need of peace and favoured a meeting of Labour delegates in Stockholm.

The evolution of Russia was not much affected by these contradictory views of the Entente emissaries. The offensive was tried with disastrous results. The Russian army dissolved under the influence of the "peace at any price" movement. Disappointment with the conduct of revolutionary Russia was reflected in the sympathy on the part of certain circles in England for Kornilov's attempt, a sympathy which did not help but rather hampered him. The advent of the Bolsheviks drove the western Powers into an attitude of absolute helplessness. They could do nothing to counteract the Brest Litovsk negotiations, and, at the same time, they were not in a position to break off all relations with the Communist Government for fear of its taking sides with the Germans. Even the shooting of the British naval attaché by Bolsheviks did not rouse them from their torpor. The Brest Litovsk peace, the occupation of southern Russia by German troops, the intervention of the Germans in Finland, obliged them, however, to adopt a decision. The embassies were gradually withdrawn, the semi-commercial and semi-diplomatic mission of Mr. Lockhart did not lead to any favourable results, and in the summer of 1918 all official relations with the Government of the Soviets were broken off. A state of more or less active hostility set in when the anti-Bolshevik troops were being reorganized on an extensive scale in various parts of Russia. The White forces received support from the Allies in the shape of military supplies, occasional expeditions, and a blockade of the ports controlled by the Soviets. Concurrently with this intermittent support of Russian national armies, the Allies encouraged and protected all the nationalities of the Empire which were striving for a separation from Russia: Poland and Rumania came to be looked upon by the French as the bulwarks of Western civilization against Russian barbarism and German militarism. The Baltic States (Latvia, Estonia, Lithuania) and the Caucasian formations (Georgia, Armenia, Azerbaidjan) were backed in their separatist aspirations by Great Britain. This tendency to dismemberment of the Russian Empire could not be harmonized with the ideals and efforts of Russian patriots, but the Entente Powers did not pause to reflect on the inadvisability of destroying with one hand what they were helping to build up with the other. Psychologically, their centrifugal policy was connected with old antagonism to the Russian Empire, with dreams of national self-determination, restricted somehow by the vital interests of the "Big Four," and—after the victory over the Central Powers—with the

Versailles delusions of overwhelming power over the world. The incoherence and vacillations of Entente policy might not have been so pernicious if Russian patriots had been able to muster an overwhelming array of anti-Bolshevik forces in Russia itself. Unfortunately this was not the case.

*Anti-Bolshevik Governments.*—During the first months of the Soviet regime, while the power of the proletarian dictators was still shaky and unorganized, several concentrations opposing them were formed in the East. First, Colonel Semenov, a leader of Transbaikalian Cossacks, had started a guerrilla warfare on the borders of Mongolia and Manchuria, advancing in the direction of Chita when luck favoured him and retreating across the Chinese frontier when he met superior forces of the Bolsheviks, together with the Magyar, Austrian and German prisoners of war mobilized by the latter. In May 1918, he succeeded in forming a provisional government in Chita. Soon afterwards, Admiral Kolchak, a brilliant naval officer, who had distinguished himself in the Japanese War, organized another Provisional Government in Novo Nikolayevsk at the junction of the Siberian railway with the Maritime province line. The Japanese, who had landed a detachment in Vladivostok, supported him in a general way.

About the same time, in the spring and early summer of 1918, there occurred another startling event. Czech detachments which had been formed to fight for Russia from among prisoners of war, and who had fought gallantly against the Central Coalition in the last campaign, demanded to withdraw after the *débâcle* of the Russian army and the advent of the Bolsheviks. They were allowed to do so by the Soviet authorities, but they were to be disarmed, and in the course of their movement east towards Vladivostok they were subjected to offensive and treacherous treatment. Some of them refused to give up their arms; others, after having been disarmed, broke away, recovered arms and munitions, and turned on the undisciplined rabble of the Red troops. As a result of encounters of this kind, the Czechs, and some Slovak detachments which had joined them, seized great tracts of the Siberian railway line near the Volga, near Irkutsk, and by Vladivostok. Eventually, after many vicissitudes, these corps made their junction along the whole line. The total number of troops who effected this *coup de théâtre* averaged some 80,000 men. It would be useless to follow in detail the swaying fortunes of these detachments. Their daring exploits would hardly have achieved success if a considerable portion of the population of eastern Russia had not sympathized with them. As it happened, these disciplined troops succeeded in creating the backbone of resistance against the Moscow dictators: in Siberia, Provisional Governments were formed in Vladivostok, in Harbin (General Horvath), and in Tomsk, besides the centres of military administration started by Col. Semenov and Admiral Kolchak.

Unfortunately the various governments comprised different and mutually hostile groups, which could not be prevailed upon to act loyally together. The Vladivostok concentration reflected the Socialist ferment in the country, and worked for an independent Siberia. The Government formed in Tomsk was an Executive of a Siberian Duma, composed of delegates from various organizations—zemstvos, municipalities, political parties, social groups (workmen, students, coöperative associations). The majority of these constituencies followed a socialistic orientation, but their Executive adopted a more conservative policy and admitted several Cadets into its ranks. From Samara came yet another political tendency: some thirty fugitive members of the Constituent Assembly, dismissed by the Bolsheviks, had assembled there, and their political creed was expressed in the demand for a restoration of that Assembly, which they considered as the only body constitutionally entitled to wield power in Russia. Their aim was to reconstitute an All-Russian State, which would include Siberia as an autonomous part of its organization. On the other hand the administrations of General Horvath and Admiral Kolchak, while reserving the ultimate decision as to the system of Government to a new Constituent Assembly, discarded the authority of the

one elected in December 1917 as not representative of Russian opinion. These administrations favoured the propertied classes and built up their personnel from the remnants of the military and civil bureaucracy of the monarchical period. Even in the face of the enemy all these groups found the greatest difficulty in establishing coöperation. The Vladivostok Government submitted to the authority of the West Siberian one, but the negotiations with Horvath were protracted and fruitless. A *coup d'état* on a small scale was attempted in Vladivostok by Horvath's lieutenant, Gen. Pleshkov, but the Allies intervened to reestablish the Socialist administration because it was approved of by the Vladivostok zemstvo.

In the west a conference held in Ufa laid down the foundations of an All-Russian scheme in connexion with the Constituent Assembly of 1917, and succeeded in persuading the Siberian Government in Omsk to recognize its authority. The moving element in this case came from the Moderate Socialists, chiefly Social Revolutionaries, but Social Democrats of the Plekhanov persuasion and some Cadets were in agreement with them. A directorate of five consisting of Avksentiev, Zenzinov, Vologodsky, V. Vinogradov and Gen. Boldyrov was established. Admiral Kolchak accepted the portfolio of War in the Ministry which was to conduct the actual administration. This amalgamation of Governments was arranged in the beginning of Oct., and a mobilization of certain classes of the Siberian population which had been started somewhat earlier was carried out on a more extensive scale: it yielded some 150,000 men, whose military instruction had to be taken in hand under very difficult conditions. Many delays and mistakes occurred, and the different sets of people who had been brought together with such difficulty quarrelled over the task, suspected and accused one another. The officers who had served under the old régime were displeased with the policy of the Directors, whom they accused of indecision and vain talk; the Socialists chafed at the high-handed way in which they were treated by the military chiefs and the employees of the Ministries. In the night of November 18 these dissensions came to a head. A party of soldiers led by officers of the Omsk garrison arrested the Socialist members of the Directorate, Avksentiev and Zenzinov, and two of their assistants, while a third Director, Vologodsky, joined a meeting of Ministers which elected Admiral Kolchak as Supreme Ruler. In the communiqué issued on the occasion by the newly constituted Government, it was explained that "wide social circles had been discontented with the wavering behaviour of the Provisional All-Russian Government in regard to certain tendencies of the Left leading to the renewal of a destructive policy." While condemning the *coup d'état* as an illegal act the new Government endorsed it by taking advantage of the accomplished fact: Avksentiev and Zenzinov were allowed to escape and the two remaining Directors, Boldyrov and Vinogradov, retired.

Such a start did not augur well for the future of the reconstruction movement: it showed that the enemies of the Bolsheviks were still irreconcilably divided by the old feud between Conservative Nationalists and Socialistic idealists. These conflicts helped to keep alive in the mass of the people a spirit of lawlessness and distrust. And yet nothing was more needed in those days than steadiness and forbearance as regards details; those who had assumed the task of restoring order were least able to lay claim to efficient administration—the lack of experience and even honesty was felt everywhere. The mobilization, for example, was carried out in the most haphazard fashion, crowds of conscripts being left even without accommodation.

The fact that the Bolsheviks in Siberia were drawing largely for support on the Austrian, Magyar, and German prisoners, of whom about half a million were dispersed in various localities of the wide country, and the difficult situation of the Czechs astride the Siberian railway, had provoked an intervention of the Allies. Japanese, American, British and French detachments were landed in Vladivostok with instructions of varying intensity: all the intervening Powers gave assurances of their disinterestedness, of their friendship for the Russian people, of

their resolve to leave it entirely free to decide as to its destiny; but while the Japanese were committed by their past and their future to safeguard and promote their own interests, the Americans were enjoined to restrict themselves to guarding railway communications and stores, and the French colonial troops held aloof. The British followed a middle course in the sense that part of their contingent, Col. J. Ward's Hampshire Regiment, was pushed forward right through Siberia, but there was no clear military aim in that operation and steps were retraced when the real difficulties set in. Material support was given by the British more than by anybody else, but these measures were in the nature of a risky speculation dependent on the trend of home politics and on the ability of the "White Guards" to win the game.

A somewhat different situation arose in the north of Russia, where the rule of the Soviet Commissars was overthrown both in Archangel and in the Murman, and a patriotic Government was set up under the leadership of N. Tchaikovsky, a "Popular Socialist," who had lived in England for many years as an exile. The opposition between progressive and conservative circles, and the difficulty of conducting business with the available demoralized elements, were also felt there, but Great Britain's stake in the game was much more conspicuous, and the British detachments under Generals Maynard and Ironside formed a very important part of the forces operating against the Bolsheviks. There was, however, no real cohesion between the Russians and their British allies, although cases of acute hostility were exceptional. Apart from such dissensions the ground was felt to be shaky on account of the war-weariness and the fickle temper of the common people. The massacre of the British officers by the men of Dyer's battalion showed that Bolshevik propaganda and Bolshevik habits were by no means a thing of the past.

The southern front, organized by General Denikin after Alexeiev's death, was suffering from similar weakness. The Voluntary Army constituting its backbone had become an efficient and powerful instrument of war; the officers' division, which had formed its bulk in the beginning, had expanded gradually into several corps by drawing into its ranks veteran soldiers who had learnt their trade in the terrible battles against Germans and Austrians. But the trusty regiments named after Kornilov, Alexeiev, Markov and Drozdovsky, had to act together with the levies of the Don and the Kuban Cossacks, who, though unrivalled as irregular horsemen, had their own axe to grind in the conflict. The Don province had been subjected to repeated attacks and devastation, and many of the Cossacks were anxious to keep to their frontiers and to manage their own affairs. As for the Kuban people, they were divided among two sets: the men of the "line" in the north were patriotic enough and fought brilliantly, but the Black Sea Cossacks, mostly descendants of the Zaporog Cossacks transferred to the Kuban from the Dnieper by Catherine II., were animated by a spirit of separatism and ready to follow leaders who worked for a Cossack Republic. A great deal depended on the skill and the political insight of Denikin's administration, and in this respect, as on the eastern front, grievous blunders and abuses occurred. The main direction was necessarily in the hands of military commanders inclined to insist above all on discipline, and contemptuous as to political theories and subtle distinctions. Denikin himself, though perfectly honest and straightforward, held systematically aloof from constitutional disputes, and declared his task to be primarily one of liberation and restoration. His principal assistants, Generals Dragomirov and Lukomsky, had even less taste for political "metaphysics," and one of the civil advisers, Prof. K. Sokolov, openly expressed the view that the only régime suited to the circumstances of the time was a "democratic dictatorship" satisfying the needs of the common people. Although nothing was prejudged as to the ultimate form of Government, the organization of the southern territories occupied by Denikin was cast in the mould of the supreme authority of the commander-in-chief. By his side stood a Special Council composed of the heads of departments and of a few representatives of public

opinion. All the members—some twenty—were nominated by the commander-in-chief. The elements of military and civil bureaucracy were decidedly predominant, and the "Left" was confined to three Cadets, all moderate Liberals. The Socialist parties were excluded from the Government and kept under strict supervision as regards their Press. One of their influential leaders, Schröder, was deported by order of the Government; many others left of their own accord for the Crimea. The greatest difficulty was experienced in holding the balance between the aims of the Volunteer Army engaged in the reëstablishment of a National State and the aspirations of the Cossack communities, tending towards federalism. The problem of reconciling these contradictory tendencies was a most difficult one. The Kuban Rada (Assembly) manifested openly separatist leanings: its leaders, Bytch and Makarenko, were dissatisfied with a dualistic arrangement conceived after many efforts between the Higher Command and the Rada. They wanted the political independence of the Kuban to be recognized, and sought an alliance with other Cossack territories in order to strengthen their demands. This political strife reacted in a most unfavourable manner on the conduct of operations in the field.

*Reds v. Whites.*—Disgust with the hypocritical tyranny of the Bolsheviks and the humiliation of Russia found a vent in conspiracies and risings among the intellectuals. The German ascendancy was challenged by the murder of the ambassador, Count Mirbach, in July 1918. Almost simultaneously the commissar in charge of the police in Petrograd, Uritsky, was killed, and Lenin himself dangerously wounded by a Socialist. The Social Revolutionaries made an attempt to overthrow the Bolsheviks in Moscow, but were suppressed with great slaughter. Later on, the most experienced of Terrorists, Boris Savinkov, engineered a rising in Yaroslavl and neighbouring districts; it was quelled after bitter fighting. These isolated attempts in the heart of Russia were not so dangerous as the simultaneous advance from the east and the south. Kolchak's armies reached at one time Kazan and Simbirsk, Denikin pushed as far as Orel, and in the north there was some hope that Gen. Ironside's British column might have joined hands with Kolchak's force near Kotlas. The Communists made desperate efforts to meet the onslaught. The Red hosts were reorganized by former officers of the Imperial army, with Polivanov, Theremissov, Klembovsky, Parsky, Dalmatov at their head. Even Brussilov lent the prestige of his name to the cause of the Moscow Soviet. These men were inspired not only by the pressure of want and despair, but in many cases by a fatalistic belief that they were serving the interests of Russia under the Red flag as against reactionaries and foreigners. An iron discipline was reintroduced, disobedience, treachery and cowardice were promptly punished with death, desertion was repressed as far as possible, there was no more indulgence for committee discussions or for the "self-determination" of military units which had wrought havoc in the last stage of the war against the Central Empires. In every battalion, squadron and battery nuclei of devoted Communists were inserted in order to watch and to lead the apathetic rank and file. Altogether the proletarian dictators reverted without any scruple or confusion to the practices they had fiercely denounced in the time of defeatist propaganda. The cadres of the army were gradually filled by wholesale mobilizations, and although crowds of conscripts were swept away by desertion, there remained enough in the ranks to outnumber the White forces: the fact that the Bolsheviks had got hold of the solid centre of Great Russia against the weaker outlying portions of the Empire was bound to assert its overwhelming influence in the end. Of course, if there had been an elemental popular rising against the proletarian leaders, they could not have withstood the attack. But the Great Russian peasantry, although by no means sympathetic to Communist doctrines and hostile to many of the commissars, were yet under the spell of the opinion that they were defending their newly conquered land against the squires who wanted to get it back. While this broad basis of popular support remained unshaken the dictators could exert their cruelty and lusts with impunity.

Terror against the bourgeoisie had been proclaimed by them from the very beginning: it formed one of the main planks of their platform. It was expanded into a system of wholesale slaughter and ruthless inquisitorial measures as a means of self-defence. The Extraordinary Commission (the famous *Tchresvichayka*) thrust the Tsar's *Okhrana* into the shade; as a matter of fact, it was served to a large extent by hangmen, torture-masters and spies borrowed from the Tsarist police, but acting with much greater independence and thoroughness. By the side of this cold-blooded and systematic machinery for crushing human beings acted innumerable gangs of ruffians and criminals, who robbed and killed in the sacred name of the Red Revolution with complete impunity and with the approval of the ruling powers. It is quite impossible to estimate the number of victims who fell a prey to this campaign of hatred.

Here is an extract from Bolshevik sources which may illustrate this butchery, although it does not in any way give an idea of its real dimensions:—

"In 1918 the persons arrested on the charges of counter-revolution, crime in office, speculation, use of forged and other people's documents, etc., numbered 47,348. In 1919 the activities of the *Tchresvichayka* developed, and the number of persons arrested reached 80,662. Out of the total number of persons arrested in 1919, 21,032 were classed as counter-revolutionaries, while 19,673 were arrested for crimes of office. Out of the 128,010 arrested in 1918-9 54,250, or 42½%, were liberated without subsequent consequences. Eight per cent of the total number of persons consisted of hostages. Nearly 11% were sentenced to compulsory labour, 29% retained in prison, and nearly 8% sent into concentration camps. In 1918 6,185 persons were executed and 3,456 in 1919, the total number during the two years being 9,641." (*Lazies, The Fight on the Home Front.*)

In such cases it is not only the number of victims that counts, but also their quality: as in the times of Ivan the Terrible, only "God knows the names of the murdered," but let us notice by way of example that some of the most respected among Moscow's citizens, whose whole lives had been devoted to the service of the people—the Astrovs, the Aliforovs, N. Shtechepkin—were shot as "spies" in the summer of 1919.

What did the Whites oppose to the Red fury? In fighting prowess the Whites were more than a match for the Reds, especially on the southern front: the exploits of Wrangel's Caucasian corps in the attack and defence of Tsaritza, the advance of the Volunteer army's infantry against heavy odds on Kharkov and Kursk, the rally at Rostov in the last months of 1920, are proofs of the excellent quality of Denikin's troops. Kolchak's Siberians were not seasoned to the same extent, but they were good material and improved rapidly, and the Orenburg and Ural Cossacks operating between the two groups did everything humanly possible to oppose the Reds. But neither the eastern nor the southern armies were supported by a tolerably organized rear. Kolchak and Denikin moved rapidly forward in the hope of cutting off the economically important district of the Ural, the Donets, the corn-growing provinces along the Volga and in the Ukraine, but their rapid advance involved a hasty and superficial occupation of wide tracts. They flooded their regiments with unwilling conscripts and had to rely for supplies on requisitions: the corn and the horses of the peasants were seized without any regard for the needs of the farmers, while the raids of Cossack cavalry into regions held by the Reds resulted in indiscriminate looting of friend and foe. What constantly happened in such circumstances was that the advancing Whites were received with "bread and salt" and attacked in the rear when they had been in the country for some time.

If the White leaders had succeeded in persuading the people that their aim was genuinely patriotic and that private interests had to be sacrificed for the sake of the great cause, all the miseries of civil war might have been endured, if not willingly, at least with resignation. But neither on the eastern nor on the southern front did the Whites establish confidence, that condition precedent of success. There cannot be the slightest doubt that not only Denikin and Kolchak, but also their principal followers were fighting for the ideal of a reunited and free Russia, but there was too much of the hated past intermixed with their efforts; corrupt officials, greedy squires had flocked to the White

banners and were clamouring and pressing for revenge and compensation. The frequent cases of lynching of commissars and Communists were an inevitable consequence of the civil war and of the hatred inspired by the wreckers of Russia: it was impossible to draw the line between justified retribution and wanton cruelty in many of these explosions of wrath. Sometimes, as in the case of Jewish pogroms in the Ukraine, subordinate officers acted against the direct orders of the High Command. But there were other signs of the time in the policy of the White leaders which created the suspicion that they were out for a counter-revolution, for the reestablishment of the old monarchy and the old gentry. The Socialists, who formed a great part of the intellectual class as far as the latter still existed, were driven back without any regard for the fact that they were natural allies in the struggle against Communism. One of the leading members of the Constituent Assembly was shot by Kolchak's Government in Ekaterinburg. The same fate befell leaders of the Kuban separatists in Ekaterinodar. The Liberal members of the Denikin "Special Council," like N. Astrov, protested in vain against a policy directed against all Socialists indiscriminately. If Denikin had not personally prevented further persecutions and open reaction, the dictatorial schemes of the generals would have been embodied in some drastic Act of the State for which Prof. K. Sokolov would have supplied a juridical formula. As it was, for the mass of the people the repeated protestations of acceptance of the social results of the Revolution seemed belied by the way in which agrarian reform<sup>1</sup> was to be regulated. The subtle distinctions concerning compensation and redemption tax reminded the peasants forcibly of the procedure followed by the Emancipation Act of 1861, and the Reds were not slow to take advantage of this unfortunate association of ideas. The Whites started also a propaganda office (*Osvag*), but although some 200 million rubles are said to have been spent on it, its activity was subjected to bitter criticism by various groups in the camp of the Whites. The state of affairs brought about two fatal results—confusion in the rear of the White armies, and discord between the patriotic forces in Russia and the Allies.

The conditions in the rear of Denikin's army were described by Soviet propagandists with ironical satisfaction. There can be no doubt that the activity of "green" bands of marauders, and the rise of such potentates as Makhno, a brigand whose followers are said to have mustered at times some thirty thousand, made orderly life in the rear impossible and drew off considerable forces at the most critical moments for the maintenance of some sort of communications. What proved even worse was the defection of dissatisfied Cossacks. When the Volunteer army was straining its forces to hold the line against the Reds north of Rostov, Kuban troops left their positions and went home, leaving Denikin's right flank unprotected.

A similar state of affairs prevailed on the eastern front: the population in the rear, excited by Communist propaganda and fraternizing with the lawless elements so numerous in Siberia—convicts and prisoners of war—conducted a constant guerrilla warfare against the Russian and foreign troops protecting the Trans-Siberian railway line. Kolchak tried to counteract this shocking demoralization by reorganizing his government under

<sup>1</sup> The following were the conditions of land reform proclaimed by Denikin on July 19 1919:—

- (1) Safeguarding of the interests of the toiling population;
- (2) The creation and the placing on a sound basis of small and medium homesteads out of the land belonging to the State and private owners;
- (3) The preservation of the right of the landowners to their land, coupled, however, with the apportionment in each district of the amount of land that is to be retained by the former owner and the order of the transfer of the remainder into the ownership of those who are land-poor;
- (4) These transfers may be achieved by *voluntary agreement*, or by *obligatory alienation for compensation*. The new owners are to acquire inalienable rights to their allotments.
- (5) *Intensive aid to be given to tillers of the soil*, through technical improvement of the lands, expert agricultural assistance, the supply of implements, seeds, dead and live inventory, etc.

the leadership of an energetic and enlightened man, Pepelayev. It was too late and the administrative personnel too insufficient to avert the catastrophe. The eastern front gave way even before the southern one. Thousands of soldiers and refugees perished in the retreat through the icefields of Siberia in the winter of 1919-20; Kolchak and Pepelayev, who had sought the protection of the Czechoslovaks, were handed over to the Bolsheviks in pursuit with the consent of Gen. Janin, the commander of the Allied contingents, and shot; while the Czechs succeeded in extricating themselves and carrying off part of the gold reserve seized during the occupation of Kazan.

*Allied Intervention.*—The action of the Allies in these deplorable times was contradictory and ineffective. Large quantities of munitions and supplies were furnished to the patriotic armies; sometimes the consignments arrived late or were in damaged condition, while a good deal of pilfering and embezzling occurred, but, on the whole, it is certain that the White armies could not have held the field for a month without this material assistance. Huge sums of money were provided to help the Russian commanders to tide over their financial difficulties, and it is estimated that the British spent about £1,000,000,000 in these transactions. But while so much was done in this direction, the diplomatic and strategic steps taken by the Allies were not only inadequate, but often mischievous. The policy of support for the patriotic movement in Russia lived, as it were, under a cloud: it was disturbed and hampered right through by the opposition of strong currents of opinion in western Europe and in the United States. There was, to begin with, the fear of infection of Allied troops by Bolshevik propaganda—a fear justified to some extent by such facts as the conduct of French sailors and soldiers in Sevastopol and in Odessa, where the red flag was actually hoisted by French men-of-war, and certain battalions of the army of occupation showed a marked disinclination to fight the Reds. This fear that war-weary soldiers of the Entente might not be proof against Communist propaganda led to the undignified scampering out of the Crimea and from the south-west. Even more important was the sympathy shown to the cause of the Bolsheviks by Socialists in France and the Labour party in England, a sympathy in which they were supported by influential organs of the Radical press. This feeling manifested itself in a variety of shapes and degrees: some regarded the violence and destruction of the Communist upheaval as the beginning of a new era in social history characterized by the overthrow of capitalism; others condoned terrorist methods as a necessary means of revolutionary action; others again were prepared to admit that these methods were justified by the misrule of the Tsars that had provoked the vengeance of the people; all were inclined to balance the misdeeds of the Reds by the excesses of the Whites and all objected to intervention in favour of the latter. The reorganization of Russia on Imperial lines was distasteful to many English Conservatives who were still under the influence of the ideals of Disraeli. Last, but not least, there was a growing number of "realists" who contended that the Bolsheviks had proved their right to rule because they had defeated their opponents in the field and that in these circumstances it would be best to recognize facts and to draw from them such advantages as could accrue to business men from the needs of a great country.

The weaknesses and failings of the White organizations in Russia presented most convenient materials for the action of all these elements opposed to Allied intervention. The result was a series of inconsistent steps which contributed to the decline of the cause of reconstruction. In Jan. 1919 came the proposal of the "Big Four" that the belligerents of the civil war should meet in Prinkipo and discuss conditions of pacification—a proposal that reflected in a striking manner the peculiar combination of impractical idealism, superficial knowledge and the yielding to "happy thoughts," which formed one of the characteristics of the Versailles Conference. As the Arcadian perspectives of Prinkipo did not meet with the expected response on the part of the belligerents, schemes acknowledging the standing of the proletarian dictators began to crop up, in connexion with fa-

vourable reports by enterprising American journalists (Mr. Bullitt's mission). At the same time the British War Office countenanced the plan of a raid on Petrograd to be carried out by the victor of Sarikamish, Gen. Yudenich. This enterprise was attempted with insufficient forces (some 15,000 men), it was in the nature of a gamble, but even gamblers do not usually put stakes on opposite sides. In this case, however, the Allied High Commissioner, Gen. Sir Hubert Gough, paid more attention to the aspirations of Estonians, who were anything but keen to promote Yudenich's success, than to the requirements of the Russians. The climax of that form of intervention was reached when Gen. Gough's chief-of-staff, Col. Marsh, gave the Russians three-quarters of an hour to form a North-Western Government and to recognize the independence of Esthonia. No wonder the expedition did not prosper.

By Nov. 1919 Mr. Lloyd George had come to the conclusion that it was advisable to renounce intervention and to leave Russia to her fate. Though doing lip service to the unforgettable services of Russia in the war, he submitted that it was not in the interest of Great Britain to assist in strengthening that country. This point of view prevailed definitely in 1920. When Denikin was forced to abandon the North Caucasian territory, British policy steered towards a liquidation of the Russian imbroglio. Wrangel made a last and gallant stand in the Crimea, but he was recognized and supported by the French only, while Great Britain took up an attitude of neutrality favourable to the Moscow dictators.

In the war which Poland waged rather imprudently when the danger of restoration of Imperial Russia had vanished, Great Britain was prepared to surrender Poland to Bolshevik hegemony, and when the tables were turned before Warsaw, thanks to the assistance of the French, British diplomacy employed itself in arranging an armistice between Poles and Bolsheviks which enabled the latter to concentrate their forces against Wrangel and to crush him. This cleared the way to a "complete control" of Russia by the Communists, and enabled the British Premier to give effect to the plans of a resumption of commercial relations with "Sovdepija." There were, indeed, two aspects of Bolshevik policy to be considered—the alluring prospect of exploitation of latent and immense natural sources offered by Mr. Krassin, and the uncompromising attitude of the Third International, founded in Moscow for the express purpose of revolutionizing the world by fair means or foul. While France and the United States refused to have anything to do with a "Government of assassins," realistic considerations prevailed with Great Britain and Italy. Communist propaganda was treated as a bogey, and disarmed by certain stipulations as regards India and by vague promises of a general nature. On the other hand the door was open to trade, not indeed on account of "bulging corn bins" in Russia (as Mr. Lloyd George had once suggested), but on account of her need of everything in the way of raw materials and manufactures. The dictatorship of the proletariat was recognized as the *de facto* Government of Russia, and its leaders encouraged to adopt a policy of renunciation of their doctrines in return for retention of power.

#### THE SOVIET CONSTITUTION

It remains for us to consider the internal evolution of this newly recognized member of European society, and the results achieved by its rule.

Apart from general declarations of principles, the constructive policy of the Communists may be said to have been initiated at the fifth Congress of Soviets which met at Moscow in July 1918. It consisted originally of 1,132 members with power to vote, of whom 745 were Bolsheviks, 352 belonged to the Social Revolutionary Left, 14 were Maximalists, 4 Anarchists, 4 Social Democrats of the Internationalist group, 10 were outside any party, 3 belonged to "miscellaneous groups." At a later stage the Social Revolutionaries disappeared in consequence of disagreement and risings, and the Congress was supposed to comprise about 1,000 members. From a formal point of view the most important business transacted by this Congress was the

acceptance of the Constitution, but this was carried in a hurried manner at the close of the session and without any debates to speak of, when the opposition had been ejected from the Assembly. Nevertheless it is advisable to begin with a summary of its most important provisions. It proclaims itself to be the Constitution of the Federal Socialist Republic of Soviets. As a matter of fact there was no federalism about it, as no means had been provided for any genuine expression of the will of the component parts. The Ukraine, for instance, was never allowed any self-determination, but was simply conquered by the Bolshevik armies and subjected to the rule of Moscow authorities, although the pretence of separate existence and organization was kept up. The social basis of the republic was formed by the workmen and the peasants, while all those who used the labour of others for their benefit were disfranchised.<sup>1</sup> One of the fundamental assumptions of the system was that the normal kind of work that counts is manual work and all forms of activity which do not take the shape of manual work have, as it were, to justify their existence in relation to manual work. At best a rough equation was established between various forms of employment, at the worst people who could not claim the designation of workmen were declared to be bourgeois under suspicion. In principle no distinction was made between various kinds of performance in point of quality, and in introducing the project of the Constitution the reporter, Stelkoff, appealed in as many words to the famous maxim of Fourier: "To everyone according to his needs." It may be noticed, however, that the other side of the saying—"From everyone according to his faculties"—was also acknowledged in a somewhat peculiar form (by Trotsky): those who refuse to work need not eat. The threat was directed primarily against the civil servants who had thrown up their office work, but the principle admitted of wider application and came to be applied to workmen in general.

There was no attempt at democratic equality, in any sense. As regards electoral representation, for instance, an industrial worker was treated right through as worth five peasants: 25,000 of the former were reckoned for each delegate of a Soviet Congress and 125,000 of the latter; the same ratio obtained in local and provincial organization.<sup>2</sup> Instead of the *direct* elections on which so much insistence was laid in the democratic stages of the revolutionary movement, all elections were managed on the principle of an ascending scale from lower to higher units. The result was that undesirable elements were weeded out in the process by means of wire-pulling or by downright violence. The clubs of Communists in the various local centres acted as committees of supervision, and terrorized the country so effectively that the Communist party, which on its own showing did not number more than 600,000 members, invariably captured three-fourths or more of the seats in the Assemblies.

The masses of the peasantry, to whom reference was so often made in the speeches of official Bolshevik orators, had much less chance of being heard than in the gerrymandered Dumas of the Tsarist regime: the so-called delegates of workmen, soldiers and peasants were generally intellectuals with a more or less incomplete educational record, but expert in journalistic propaganda and free from all received notions as to morality, humanity or justice. The Congress of Soviets should have met at least once in six months; but this rule fell into abeyance, and the years 1919 and 1920 saw only two congresses (the seventh and the eighth). The intermediate institution of the Central Executive Committee of 200 (later 300) had to act as a kind of Parliament in the absence of the Congress, and was entrusted with supreme authority all the while; but the Board of Commissioners of the People, corresponding to a Council of Ministers

under the Parliamentary regime, wielded the real authority. It took its lead again from its *presidium*, on which the Government of Russia entirely depended. In this way the appearance of democracy was reconciled with the reality of a very narrow oligarchy, according to the pattern worked out by the French Jacobins in the days of the Committee of Public Safety. A curious device of the sophistical combination consisted in making members of the Central Executive Council at the same time supervisors and subordinates of the commissars, as if genuine control could be expected from persons employed in working the machinery under control.

Local units were subjected to similar limitations: the bourgeois of all descriptions were condemned in every respect to the position of outcasts. Elections were to be conducted under constant pressure from the Communist clubs, and inconvenient persons were to be removed from participation in local as well as central government. A characteristic application of this all-pervading suppression of the bourgeois is the handing over of all technical means of publicity, in other words of the Press, to the workmen and peasants. This meant that there is no possibility for expressing any opinions except those approved by the Bolshevik clubs. The Press was not gagged—it ceased to exist as a free agent. It became a means of reproducing in thousands of copies the standard views decreed by the Bolsheviks. The Tsarist regime never aspired to this complete suppression of public opinion. The right of assembly was vindicated in the same way in the Constitution. The preamble of it started with a sounding declaration of freedom; but it was sufficient for commissars to declare a meeting to be counter-revolutionary in order to be entitled to put an end to it by force.

The Bolshevik legislators prided themselves on having got rid of the division of the functions of legislation and administration, and treating both as alternative manifestations of the will of the living communities of workmen and peasants. One of the effects of this unification of power in the collective unit was the right to recall representatives which belongs to the rural communities, the trade unions and the military units. In actual practice the recall was used to allow free play to the Communist wire-pullers, who were careful to watch over the orthodoxy of the various soviets. The alternation of functions opened the door to log-rolling and capricious changes of policy. Perhaps the most striking expression of the inanity of these constitutional functions was to be found in the position of the delegates of the Red army, who had to represent simultaneously controlling power in the Executive Council and the "iron discipline" of the Bolshevik regime in the ranks.

Altogether the "Constitution" of the Federal Republic of Soviets was clearly intended to be an instrument for the oppression of the formerly privileged classes and a means of propaganda for the edification of people who want to believe in the benefits of Communist rule. When reproached with the duplicity and the contradictions of this paper arrangement the Bolshevik answers: all derogations from principle are justified by the necessity to fight the counter-revolutionaries and to destroy the bourgeoisie. Pure Communism can be introduced only when the people have been ground into uniform pulp: then Law and the State will disappear of themselves. As long as there is any opposition anywhere dictatorship of the proletariat has to be kept up, and as the mass of the people is not permeated with Communist consciousness the dictatorship can only be constituted by the enlightened minority. Hence the necessity of the rule of the few for the sake of the proletariat. It is interesting to read the justification of the Soviet system on the ground that it makes popular government a reality while parliamentary institutions provide mere fictions:—

"In democracies the only way in which a workman or a peasant participates in government is that he puts a voting paper once in four years in a ballot box. The Soviets are direct organizations of the masses; they are not impermeable, there is the right of recall. . . . And this is not only the case with the Soviets which form, as it were, the top of power . . . the organization does not only belong to workmen, it is indeed a working one. In democratic commonwealths the supreme power belongs to parliaments, that is, to talking-

<sup>1</sup> Chap. IV., 7. The Fifth All-Russia Congress of Soviets of Workers', Soldiers' and Peasants' Delegates considers that now, at the decisive moment in the struggle between the workers and their exploiters, there can be no place for the latter on any governing body.

Chap. XIII., 65. The following persons have neither the right to vote nor to be elected:—

(a) Those who employ others for the sake of profit.

(b) Those who live on income not arising from their own work.

<sup>2</sup> Chap. X., 53.

shops. Power is divided into a legislative and an executive one. The sending of deputies from the workmen to parliament once in four years gives rise to the fiction that workmen share in political work. In truth even the deputies do not share in it, because they talk. The real rulers are the members of a caste,—of a social bureaucracy.”<sup>1</sup>

One might think that the rule of Soviets was free from all fictions and substitution of power.

*Organization of Supplies and of the Army.*—The greater part of the meetings of the Fifth Congress was taken up by the discussion of two topics of primary practical importance—the organization of supplies and the organization of the army. The first of these questions gave rise to a violent conflict between the Bolsheviks and the Social Revolutionaries of the Left. For the latter the socialization of the land was a measure of paramount importance for the future of Russia, and they wanted it carried out with corresponding regularity and deliberation, in conformity with the wishes and the interests of the peasant class as a whole. Spiridonova, the leader of this faction in the Congress, objected strongly to the anarchistic way in which land was grabbed by the peasants, and reproached Lenin with his cynical declaration that as the peasants had seized the land they might divide it as best they could. As a result of this cynical indifference the country-side had been a cockpit in which villagers and householders were arming and fighting for the possession of coveted plots. These rural feuds were not distasteful to the Bolsheviks, who were intent on crushing all well-to-do and thrifty elements of the population as representing the hated bourgeoisie. In practice they wanted corn supplies, knew that some were in the hands of the wealthier peasants and did not find any other means of getting at them but the raising of the poor peasants against the richer ones. The result was the creation of “Committees of the Indigent,” whose special purpose was to ascertain who had put by any supplies and to expropriate these “tight-fists.” Part of the loot would go to replenish the bins of the Red Government. This was called the “Dictatorship of the Indigent,” and Lenin boasted that the Bolsheviks had succeeded in driving a wedge into the compact mass of the peasantry.

The Social Revolutionaries opposed the Bolsheviks in terrorist measures as well as in the case of supplies. In the interval between the Fourth and the Fifth Congresses the Central Executive Committee had founded and organized the “Supreme Revolutionary Tribunal” from its own ranks. The Social Revolutionaries had consented in the beginning to take part in the constitution of this Tribunal, but they seceded from it in connexion with the first trial, when Adml. Shchaskny had been condemned to death. They protested altogether against the reintroduction of capital punishment, although they did not scruple to participate in bloody repressions of risings and conspiracies. The same difference of opinion reappeared in connexion with the reorganization of the army. Trotsky came to the Congress with a complete programme for the reconstruction of the Red army which amounted to a return to the iron discipline of the ancient regime with a change of provost marshals. “*Ole-toi de là, que je m’y mette*” was the approved maxim of the time, and, after having preached and agitated for years against the death penalty and other cruel punishments inflicted “by order of the Tsar,” Trotsky found it simple and convenient to adopt all these Draconian measures and to employ former officers of the Old Army to enforce them as long as there was not a sufficient number of Red commanders and officers to provide the necessary personnel. The Social Revolutionaries were again true to theory, and denounced this change of front with bitter indignation. Their opponents retorted that it was absurd to reject the death penalty when inflicted by the courts while practising terrorism and shooting people at sight. The Bolsheviks wanted a disciplined army, and were not disposed to be fettered by sentimental considerations or the reproach of inconsistency. These conflicts coincided with the assassination of Count Mirbach and the suppression of a Social Revolutionary rising on Mos-

<sup>1</sup> Bukharin, “The Theory of Proletarian Dictatorship,” *The October Upheaval and Proletarian Dictatorship*, pp. 19, 20.

cow: they ended in a disastrous way for the Social Revolutionaries, whose leaders were either shot or imprisoned.

In the interval between the Fifth and the Sixth Congresses the Central Executive Committee had to settle the foundations of two most important sides of social life—the organization of justice and the establishment of school education. Of course legislation in these respects was by no means restricted to the action of the Central Executive Committee in 1918: measures were taken both before and after, but our account must for the sake of convenience be concentrated around the laws and decrees of that year.

*Administration of Justice.*—Taking first the province of justice, we may notice to begin with the main principle of the Judicature: it is the substitution for the various courts of professional justice of popular courts consisting of three judges—a chairman and two assessors. The first of these was supposed to have some knowledge of legal subjects, though he need not be a trained lawyer; the assessors represent the lay community, and the framers of the new rules give emphatic expression to the wish that the common sense and the practical spirit of the lay members should prevail over technical considerations and a superstitious regard for laws enacted by overthrown governments. They refer with disapprobation to the bad influence of former lawyers who had found their way into the new courts and complicate their decisions by a casuistic treatment of the subject in the old style. The publications of the *Narkomjust* (People's Commissariat of Justice) gave unstinted praise to decisions free from the trammels of juridical dialectic and book-learning. The hope is expressed that the popular courts will open up new avenues of legal thought by the motives and arguments of their decisions and thus create a new and beneficial source of law.

One of the leading representatives of Soviet jurisprudence, Hochberg, compares the position of public and private law in the new system, and comes to the conclusion that the latter is the creation of the bourgeois social order, as it supposes an abstention of judicial authority from interference with the contents of claims and assumes an appearance of impartial indifference. This reminds one of the attitude of Pilate washing his hands, as regards the truth or justice of the verdict. Civil law is decentralizing, anarchistic, derived from a fiction of freedom, while public law aims at concentration and coöperation, and that is the law suitable to a socialistic commonwealth.

Another article on Soviet jurisprudence dwells on the total transformation of criminal law, and the author is not less nihilistic in his appreciation of this branch of legal organization than his colleague Hochberg was as regards private law; indeed, one branch is not more necessary than the other:—

“There can be no idea of retribution, because the modern scientific view does not recognize any free or responsible will. Determinists cannot build their law on the idea of punishment. It is certain that crime is the product of social conditions, and therefore cannot be imputed to any single individual. This being so, there is no reason to despair of the disappearance of crime and of the coercive law directed against it. Menger halted half way: he thought that infringements of rights are to some extent the result of human nature, of inherent self-will. But serious infringements of rights proceed from class distinctions and class antagonisms. There will be no burglary or theft when there is no private property protected by law; all serious motives for homicide and other crimes of violence will disappear when men are all comrades and there is no wealth or privilege to excite hatred. Whatever occasions there may remain for inordinate self-will will be rare anomalies and can be treated as negligible quantities.”

In spite of all these enchanting perspectives it is recognized that the stage of a lawless Elysium has not yet been reached, and in concession to human frailty certain prohibitions and rules have to be maintained in the epoch of transition. This epoch may last for a long time, because the new order can be secured only by psychological transformation, and psychological processes take many years to mature.

Meanwhile speculators, traders, hooligans and counter-revolutionary agitators have to be coerced, and this is the chief business of popular courts, reinforced in dangerous cases by the ruthless action of the Extraordinary Commission. Trade was made a punishable offence and threatened with most severe

penalties. According to Clause 1 of the decree on speculation, "a person guilty of selling, storing or keeping with a view to sell, articles of food monopolized by the Commonwealth, if he is doing this as a trade, will be punished by imprisonment for a term not less than ten years with the hardest forced labour, and by confiscation of all his goods." Clause 2 says: "A person guilty of selling, storing or keeping with a view to sell, articles of food at prices higher than the established ones, if he does this as a trade, will be punished by imprisonment for a term of not less than five years, and by the confiscation of all or part of his goods." Clause 3 says: "A person guilty of selling, storing or keeping with a view to sell, other articles the price of which has been fixed and is subject to control, if he does it as a trade, will be punished by imprisonment for a term of not less than three years, etc." Clause 4 says: "If he does not drive a trade (but does so occasionally), he will be punished by imprisonment for a term of not less than six months." Similar penalties are imposed on those who collect provision cards with a view to trade with them.

These Draconian measures were mitigated in practice by the necessity of having recourse to lawyers, who had received their education under the old regime. The majority of the personnel of the higher courts had to be drawn from that class, and did what they could to soften the asperities of Soviet legislation.

In the same way Soviet legislators had to steer a middle course as regards private law; in 1918 law as to marriage, family relations and succession was cast in a new shape. As regards marriage the chief change was the abolition of the contrast between legitimate and illegitimate unions.<sup>1</sup> The only difference was one of registration: some people might think it worth while to register their convention as to sexual relations, others did not attach importance to such routine; the consequences as to family status were about the same. Consorts kept their separate goods and had equally the right of protection and duty of maintenance as to the children. In case of disagreement in the conduct of their children's affairs, they have to apply to the local court. The latter may deprive either of them of the right of supervision in case of misuse. The wife, or woman living as such, may claim maintenance from the man with whom she has been living, if she is unable to maintain herself. As to the bringing up of children, she is allowed to claim assistance from the putative father, and if she has had such relations with several men so that fatherhood is uncertain, she enjoys the additional advantage of being able to claim contributions from each one of them. Succession is abolished. No one can dispose of his fortune by will, nor do the children inherit to the exclusion of other relations; after the death of a person his or her fortune is distributed among relations within certain degrees according to the measure of their needs. Their claims are preferred to the claims of the creditors of the deceased.

It is needless to add that Soviet legislation uprooted the rules as to contract of service. All forms of service are considered as forms of servility, as varieties of exploitation. Everyone must depend on the work of his hands and combination is entirely a matter of public law. It appears in the shape of professional unions—industrial and rural alike, or in the shape of Soviet rule substituted for the old conception of the State. Members of the Soviet Republic are comrades in work, though not in service, and it is for the Soviet Commonwealth to assign them their shares in work and produce.

Here are some characteristic passages from an article in the official organ of the Commissariat of Justice<sup>2</sup>—

"The project of the Provisional Government accepted as a basis of the legal order of industrial undertakings the fiction of a free bilateral contract." Under the rule of the Soviets "the industrial undertaking ceases to be governed by formal conventions or contracts and by one-sided declarations of the will of employers. The collective contract . . . loses the character of a bilateral convention and becomes an objective rule of conduct." This principle was first proclaimed as an exception in the case of the establishment of a tariff of remuneration in the metal workers' trade. It was subsequently recognized to be the normal arrangement of the status of

workmen. There can be no more talk of "hire" and "service"; the conception of "cooperation" taking their place. "The sense of duty and of responsibility arising from it has dictated the following clauses to the Petrograd metal workers, when they constituted their tariff without the employers. Clause 16: 'When the working man receives a definite guarantee as to his earnings, he is bound to guarantee a corresponding amount of work in the shape of a definite form of production. Clause 23: In case of evident loafing or of premeditated slowness the workman is to be moved into a lower class and can even be dismissed.' 'The juridical life of the working men is being unified by movements in two directions—towards combining local undertakings into one common State economy and by uniting the interests of separate professional groups on the lines of a common class consciousness.'"

*Education and Religion.*—Another subject of primary importance considered by the Central Executive Committee in its fifth session in conjunction with trade unions was that of the proletarian school system. There was no discussion, and the conclusions of a committee for which Comrade M. Pokrovsky acted as reporter were approved *en bloc*. The report laid stress on the necessity of getting rid of all varieties in the curriculum of schools, produced by the sinister interests of the dominant class of the old regime. The old schools had been diversified not only by horizontal partitions as lower-middle and high-schools, but also by vertical sub-divisions as special types of humanistic, modern side (*cf. Realschule*), technical, ecclesiastical schools. This tendency towards specialization served the purpose of splitting up the compact and powerful mass of working men into a number of groups on which the dominant class could practice the *divide et impera* principle. The true educational ideal was to train all the youth of the country on the same lines, leading them through the various forms and stages of application of human energy to productive work. A course of nine years, beginning at the age of eight, would be necessary to achieve this object. Of course the old methods by which "gentlefolks'" children were taught to scrawl on paper would have to be discarded. The orientation of the school should be directed towards preparing for a life in which manual work was honoured and not despised. The aim should be to educate men able on leaving school to take up intelligently and successfully any kind of task. The curriculum would be a reproduction on a small scale of the cultural history of mankind. Astronomy would be shown to have guided the men of old in their observations of the seasons on which agriculture depends; zoölogy would be taught in connexion with the tending of domestic animals, botany on the live specimens of plants. The management of the school should be an introduction to civil life, the principle of collective labour permeating all details, methods of old-fashioned subjection and discipline being entirely discarded, and the school should be constituted as a "commune" and the senior pupils should take part in its administration together with the teachers and the representatives of the working population of the district. Punishments would not be necessary in these educational communes; order would be kept up by the sense of responsibility on the part of the pupils.

A quantity of literature was produced in Soviet Russia to spread the notions of the *Proletcult* (proletarian culture). In order to give an idea of this stuff, one or two extracts may be given from a paper by Comrade Bobrinsky<sup>3</sup>—

"We have to proceed towards freedom through the iron yoke of proletarian dictatorship, towards equality through rationing according to class, towards fraternity through civil war. Proletarian science becomes in practice a weapon in the struggle for power and economic existence. Science becomes politics. The bourgeois contrast between knowledge and politics, between science and action, gives way a synthesis for the first-time: science is turned into the political force of the proletariat, and proletarian politics is turned into science. . . . Natural science is combined into a unity with social science. . . . The old disputes about humanistic (classical) and realistic education, the old criticism directed against the estrangement from life, against the academic character of education find a simple and radical solution in the school of labour. . . . Technology has acquired a place of equality with other sciences and it serves as a transition from natural science to sociology. . . . Technology becomes the principal science in the system of historical materialism. According to historical materialism all changes in

<sup>1</sup> A. Yablonsky, *The Labour Constitution in the "Proletarian" Revolution and Law*, 5-6 issue, Oct. 15 1918.

<sup>2</sup> "The October Upheaval and the Dictatorship of the Proletariat," pp. 163 ff.

social life are derived from the relations of Society to production. Everyone knows that, but it is not sufficiently recognized, that, according to Marx, the evolution of history is entirely dependent on the development of means of production and that changes in the latter are conditioned by changes in technique."

It is appropriate to mention here the policy of the Soviets as regards religion, and, more especially, as regards the Orthodox Church, as its foundations are to be found in a profound contrast of cultural conceptions. The matter is well illustrated in a paper contributed to *The Octobrist Upeval* by Comrade N. Lukin (Antonov). He begins by ridiculing the notion that the separation of the Church from the State meant emancipation for the Church from secular control coupled with the right to accumulate property and to influence public opinion on similar lines to those which obtain in Belgium. The revolution put religious associations on the same level as other common law associations, but deprived them of the right of holding property and of other privileges of juridical persons. As a natural consequence the Orthodox Church became one of the main instruments of counter-revolutionary agitation. The Council called together in Moscow did not attract any considerable attention on the part of workmen and peasants, but it was crowded with representatives of the old aristocracy, bureaucracy and counter-revolutionary "intelligentsia." The newly elected Patriarch Tikhon excommunicated the authors of the decree of disestablishment and the Council denounced it as an attack on the national faith and the religious institutions of Russia, not omitting to mention that the clergy was being deprived of the means of subsistence. In view of such an irreconcilable attitude the Soviet power is bound to wage a ruthless war against the Orthodox Church. It is armed against it by Clause 5 of the decree of Separation forbidding all ecclesiastical ceremonies and acts directed against the Commonwealth. But it must not be forgotten that even apart from the conspiracies and direct risings, religion in general is antagonistic to the social conceptions of the new order. Even in its present state the Church is able to support ignorance among the mass of the people and to divert the proletariat from the struggle for an "earthly paradise" by making them dream about a "paradise in heaven." The example of France and of America shows that the clergy is preaching war against social democracy with no less fervor because it is deprived of those powerful means of influencing men's brains which are at its disposal in countries still maintaining State religions. In creating a new world the proletariat stands in need of a complete and harmonious scientific outlook.

**Foreign and Home Policy.**—The Sixth Congress of Soviets met on Nov. 6 1918. Nineteen hundred and fourteen delegates assembled in Moscow, of whom 829 were Communists; 71 had been registered as sympathizing with Communism, and 2 as Revolutionary Communists, while 6 were declared to belong to the Social Revolutionary party, 1 to the Maximalists, 3 to no party. The president Sverdlov expressed his firm conviction that distribution of seats corresponded fully and correctly to the interests of "wide masses of the working population of Russia." The debates were overshadowed by two main facts—by the victory of the Western Allies and by the appalling food crisis.

Lenin, while admitting that the situation was extremely dangerous, because Communist Russia had to reckon henceforth not with two belligerents engaged in a struggle for existence but with the united front of the victorious Entente, thought it augured well for the progress of the world revolution:—

"A complete victory of a Socialist revolution," he said, "is unthinkable in any one country. It requires at least the cooperation of several advanced countries, and Russia is not one of them. This is why the question as to the expansion of the revolution into other lands and of our success in repulsing imperialism becomes one of the principal problems of the Revolution. . . . We must raise the proletariat of all countries."

He dwelt on the benefits conferred by the Brest Litovsk peace, which gave Russia breathing-space and the possibility of reconstructing her army. Now the aim was to carry the contagion of the revolution into Central and Western Europe:—

"We can see already how the fire has broken out in most countries—in America, in Germany, in England. . . . The peace which

the rapacious imperialists of England and France are going to inflict on conquered Europe will be a more humiliating and crushing one than the treaty of Brest Litovsk, but this very peace will be their undoing, because it will rouse the revolutionary feelings of the world proletariat. We are not living in Central Africa but in civilized countries in the twentieth century. They are raising a Chinese wall against Bolshevism, but Bolshevism will pass the wall and spread its infection among the working men of all countries."

In union with Lenin, the president, Sverdlov, declared that before six months had passed they would see Soviet rule triumphant not only in Hungary, in Germany, in Austria, but in France and Great Britain.

The problem of supplies was to be solved by expropriation in the villages. Zinoviev explained that the plan of raising the poor peasants against the well-to-do ones was being carried out with energy and success. A Congress of the "poor folk" in Petrograd had been attended by 16,000 delegates; they had resolved to organize a special "poor folk" army consisting of two men from each village. In the Novgorod Government alone 2,000 "poor folk" committees had been formed:—

"Their chief aim is to drive a wedge into village life . . . to kindle class struggle, to kindle the sacred hatred of the poor folk against the rich. . . . We say . . . the 'tight-fists' must be strangled as we said before: strangle the bourgeois in the towns. . . . We know perfectly well that we cannot carry out a proletarian revolution unless we crush the 'tight-fists' in the villages—crush them in the economic and, if necessary, in the physical sense."

The Congress adopted a resolution in conformity with Zinoviev's proposal, the gist of which was that in order to get rid of strife and confusion produced by dualism in the villages it was necessary to assign to the "poor folk committees" instituted by the decree of July 11 1918, the superior authority and to carry out a reorganization of rural Soviets on the pattern of town Soviets, turning them into true organs of Soviet power.

The seventh Congress met on Dec. 5 1919. Of the 1,109 delegates with power to vote, 890 were registered as Communists and 34 as belonging to no party. In the course of the Congress some representatives of the Social Revolutionaries and Mensheviks (Dan, Martov and others) took part in the debates, declaring their adherence to the cause of the Socialist Republic under Soviet rule, but criticizing certain methods of Soviet administration. The atmosphere of the Congress was dominated by the elated feelings produced by the victories over Kolchak and Denikin. They were extolled as triumphs over the Entente. Lenin admitted in his speech that the progress of the World Revolution had been slower and more complicated than had been expected, but he maintained that on the whole the provisions of the Bolsheviks had been justified by the course of events. The miracle of the victory of helpless and backward Russia over the all-powerful Entente was traced by him to the instinctive sympathy of the working-classes of Great Britain, France and Italy towards their brothers in Russia. As a result of this feeling it was impossible for the Allies to expose their troops to a decisive conflict with the Red army; symptoms of fraternization had begun to appear in the ranks of the western soldiers and the Entente was obliged to withdraw them. The hope to combine the minor border states against Red Russia had also miscarried, and disillusionment had been brought by the collapse of the White Guards equipped by the "imperialistic wild beasts" of England whose greed and craving for world supremacy was worse than that of the Germans. Resolutions of the Soviet greeted the toiling masses in all countries, invited them to struggle against bourgeois Imperialism and declared the Peace of Versailles a shameless attempt to establish the domination of the Allies, to divide the world into conquerors and conquered, into great and small powers, without taking heed of self-determination.

Trotsky gave a glowing account of the victorious Red army. He described it as an exact reflection of the Soviet Republic. It was built up on the principle of class domination, the ruling class being that of town workmen:—

"They form about 15-18% of the army, but they lead it on account of their greater consciousness, their stronger solidarity, the higher quality of their revolutionary mettle. The responsible posts of commissars are occupied almost exclusively by workers of the

Communist party. In every regiment, every battalion, every company is to be found a communistic cell. In this way a new communistic order of 'Samurai' has been formed. And the army is not merely a fighting organization, it is a political school the like of which has not been known to the world."

Trotsky prided himself particularly on the incessant political propaganda. "In the beginning we had not a single elementary school in the army—now we have 3,800; before the 1st of Jan. we had 32 clubs; now we have 1,315. Before the 1st of Jan. we had not a single mobile library: now we have 3,392."

As regards officers and other specialists drafted into the Red army from the cadres of the old Tsarist army, Trotsky maintained that thousands of them had reconciled themselves with their new position and were faithfully serving the new order. He was contemplating the institution of one man's rule instead of the system of commanders watched over by two commissars.

*Economic Problems.*—The most serious discussions took place in connexion with the problems of food and fuel-supplies. Tsurupa, the People's Commissar at the head of the *Narkhoskom* (the Commissariat of People's economics) gave an account of the working of bread monopoly. All corn supplies had been nationalized and the system was enforced by charging each province with a fixed contribution which was subsequently distributed among the districts of each province, while the districts assessed the villages with *quotas* according to estimation. The whole assessment of the country was reckoned at 324 million poods of corn of every kind: of the 30% which were charged to the first quarter some 60 millions were expected to come in by Dec. 1. This did not quite correspond to the demand, but as some provinces were not under the control of the Soviet power, the assessment might be said to have been carried out satisfactorily in the greater part of the country as regards corn. This did not mean, however, that the supply of corn was secured for those who needed it. Many thousands of poods lay stored and rotting at the stations, because there was no transport to convey them to their places of destination. As regards meat the situation was much worse. Only 600,000 poods were available instead of the five million delivered in 1918; the cause was the great falling off of the numbers of cattle held by the peasants. Butter and fats were also at a discount: the commissariat could not dispose of more than 300,000 poods for the whole of Russia, and that meant famine in respect of fats. Of fish roughly 75% of the normal supply had been caught but the transport conditions were badly hampering its distribution. The proposal of the Commissariat was to extend the State monopoly and the coercive assessment to all food products and it was adopted by the Congress.

As far as fuel was concerned, the situation had grown to be catastrophic. The loss of Baku and of the Donets coal-mines had largely reduced the quantity available. Instead of 500,000,000 poods of naphtha, e.g. Soviet Russia disposed of 80 million. It continued to exist only because all private stores and supplies had been confiscated. Things got better when the roads to the Donets and to Ural were cleared, but the disorganization of the transport told heavily on the distribution of fuel. As a matter of necessity Russia had to fall back once more on wood fuel, although the adaptation to a new system of heating involved immense losses. The first requirement was to provide material for the railways and that was being gradually achieved by means of labour conscription. As for domestic heating, its needs were so great that the only way of solving the problem was to cut down timber in the neighbourhood of cities, and Moscow, for example, was being served by means of the clearing of timber in an area of 18-30 square versts. The Commissariat was obliged to engage the services of private contractors and agents in order to get the required supplies. When, in discussion, fanatical Communists reproached Commissar Rykov with this deviation from the recognized principles of communism, he answered that there was no other way of collecting the timber and that, after all, the Extraordinary Commission was able to proceed against speculators and profiteers. In other words, the Soviet administrators might enable men to enrich themselves by private enterprise and then prosecute them on account of their gains.

Comrade Sofronov reported on the constructive work of the Soviet; this work had proceeded from the top to the bottom and

the administration of the country had assumed the shape of parallel columns subordinated to "heads" and "centres," each managing its own concerns, but with little connexion between them and often with opposed views on kindred subjects. The *Narkomjus* (People's Commissariat of Justice), for example, was not in agreement with the arbitrary terrorism of the Extraordinary Commission, but was powerless to influence or to restrict it, because it was acting within the column of the Home Commissariat, and no solution could be found for the difference between judicial and administrative tribunals.

The discussion gave rise to attacks on the bureaucratic centralization and the suppression of freedom by the communistic dictatorship. The reporter Sofronov admitted that there was a tendency towards one man's rule in all branches of the organization, but such a tendency, explicable in the course of civil war, could not be conceded as a principle. It did not check the complete anarchy of economic and legal relations produced by the lack of harmony in administration. It ought to be corrected by a reform of elections, which would regenerate the local Soviets and thus create a basis for political reorganization at the top. An essential condition for such a reform was the removal of counter-revolutionary elements. Therefore the electoral law ought to be supplemented by stringent enactments not only disfranchising the "tight-fists," but making it a punishable offence for them to take part in any electoral or other meeting in the village.

Lenin came forward to defend the policy of Soviet rule against the reproach of anti-democratic tendency:—

"We do not promise," he said, "that our constitution guarantees freedom and equality in general. Freedom—but it must be pointed out for what class and for what ends. Equality—but who shall be equal and with whom?—for those who work and who have been exploited in the course of centuries by the bourgeoisie, who are fighting the bourgeoisie even now. This has been stated in the constitution: the dictatorship of the workmen and of the poorest peasants in order to suppress the bourgeoisie."

These ideas were more fully developed in Lenin's speech to the Congress of School Extension workers (May 6 1919):—

"It cannot be gainsaid that *freedom* is a powerful catchword for any revolution, democratic or socialistic. But our programme declares: freedom, if it obstructs the emancipation of labour from the oppression of capital, is a fraud. Any one of you who has read Marx, or even popular accounts of Marx, knows that he devoted the greater part of his life to ridiculing freedom and equality, the will of the majority and all the Benthamites who commented on these things in glowing terms. He proved that at the back of all these phrases lay the interests of free trade, the freedom of free capital, which are used to oppress the workers. . . . We maintain that to grant freedom of meetings to the capitalists would be the greatest crime—it means freedom of meetings for counter-revolutionaries. We say to the bourgeois intellectuals, to the adherents of democracy: 'You lie when you reproach us with the infringement of freedom. When your great bourgeois revolutionists of 1649 in England and of 1792-3 in France carried through their revolutions they did not concede to the monarchists the freedom of meetings. The French Revolution was called the Great one because it was not like the weakly phrase-making revolution of 1848: after overthrowing the monarchists it crushed them out of existence. . . . The peasant is a hybrid being: half a workman and half a speculator. This is a fact from which you cannot escape, unless you destroy money, destroy exchange. And to do that you want long years of firm domination of the proletariat, because it is only the proletariat that can conquer the bourgeoisie.' When we are told, 'you have broken equality not only as against exploiters (a social revolutionary or a Menshevik might admit that), but you have broken equality as between workmen and peasants, you have broken the equality of toiling democracy, you are criminals,' we answer: 'Yes, we have broken the equality between workmen and peasants and we maintain that you, who defend this equality, are followers of Kolchak.' . . . We ask you: 'the ruined workmen of a ruined country, in which factories are at a standstill, would they be right to submit to a majority of peasants, who do not yield to them the surplus of their corn? Have they the right to take this surplus by violence if it is impossible to do so in any other way?' The peasants are a special class: as toilers they are the enemies of capital, but at the same time they are proprietors. The peasant has been taught during centuries to consider the corn as his own, and that he is free to sell it. It is my right, thinks the peasant, because it is my labour, my sweat and my blood. It is not easy to change his psychology: it will take a difficult and long process to do so. He who imagines that the transition to socialism will be effected by one man convincing another, and this other a third, etc., is at best a child, or a political hypocrite. You can, if you have luck, smash an institution at one blow: it is

impossible to smash a habit, whatever your luck. We have given the land to the peasant, freed him from the squire, thrown off all his fetters, and yet he goes on thinking that liberty is free trade in corn, and serfdom the duty to surrender the surplus at a fixed price."

*The Eighth Congress of the Soviets.*—The Eighth Congress of All-Russian Soviets was convened at Moscow on Dec. 23 1920. Approximately 80% of the delegates were members of the Communist party, the remaining 20% were not affiliated to any party. It was known that with reference to certain questions of policy there was an important divergence of views among leading Communists. These differences of opinion were especially marked in connexion with (1) economic reconstruction, including the question of concessions to foreigners, and (2) the demobilization of the army. Lenin was at the head of the so-called Right Wing, while the Left was under the leadership of Bukharin. The disillusionment of many Communists concerning Soviet administration was expressed in strong terms at the Congress. These criticisms were summarized and by one of the leaders, Ossinsky, in an article which contains the following passage:—

"For three years, the Soviet Government has seriously turned aside from the principles of proletarian democracy, and from the spirit of the Soviet Constitution. On the one hand, there have been created two legislative bodies, not provided by our constitution—the Council of Defence and the Military Revolutionary Council; on the other all constitutional organs (legislative as well as executive) have virtually disappeared. The eclipse of the Central Executive Committee is generally known. But even the Council of People's Commissars and the Council of Defence, which have ostensibly replaced the Central Executive Committee, have been, in their turn, eclipsed by still another body. In reality, the centre of political leadership has been shifted to the Central Committee of the Communist party, and even here to a smaller body, the 'Political Bureau' of this committee. Legislative measures, diplomatic acts, and military plans decided by this 'Politik-Bureau' are formally sanctioned and issued in the name either of the People's Commissars or the Council of Defence." (*The New Statesman*, 1921, p. 635.)

The Congress decided to establish Provincial Economic Conferences which should be charged with the unification of all purely local economic institutions. Meetings were to be held no less than twice a month, and the persons who were to participate in the proposed Conferences were to be designated by the Supreme Economic Council, the Commissariats of Supplies, Labour, Finance, etc. All local branches or institutions of the Supreme Economic Council in the various provinces were to be subordinated to these Provincial Councils, with the exception of so-called "principal" industries, such as important metal factories, mines, etc., which still remained directly subordinate to the Supreme Economic Council.

The number of members of the Central Executive Committee was increased to 300 and sessions were to be held at least twice a month. The managing board of the Central Executive Council was given power to cancel any decisions of the Soviet of People's Commissars. All conflicts or disagreements between the People's Commissars and Central Institutions on one side, and the local Executive Committees on the other, were to be referred to and decided by the managing board of the Central Executive Committee. All decrees and regulations of general importance, including laws, military decisions and questions of foreign policy, were to be examined by and were subject to confirmation by the Soviet of People's Commissars. The Congress considered that the Soviet of Labour and Defence which had been created at the height of struggle between the republic and an Imperialistic world (Nov. 30 1918), should be reformed so as to form a committee of the Soviet of People's Commissars. An appeal was addressed to the peasants asking them to support the republic by contributing all their surplus agricultural produce to assist the Commonwealth. Trotsky favoured a partial demobilization of the regular army and the organization of a militia.

These were the principal decisions of the Congress. The general attitude of the Communist party was best expressed in speeches delivered by Lenin and by Zinoviev. Lenin welcomed the establishment of Soviet Republics in Bukhara, Azerbaijan and Armenia, as showing that the Soviet system was acceptable, not only in industrial countries, but also in agricultural lands. It was hoped that a treaty would shortly be signed with Persia.

Relations were being cemented between the Soviet Government and Afghanistan and Turkey. Lenin defended the policy of granting concessions to foreign capitalists. It would be ridiculous to talk of Russia's economic independence while the Soviet Republic remained a backward country. Guarantees would be demanded from those who received concessions and it was essential that everything should be done to promote trade relations without delay. He reminded his audience that a long series of wars had hitherto decided the fate of the revolution. They must prepare for the next chapter in this history:—

Without economic restoration they would be unable to hold their own. To achieve this economic aim it would be necessary to unite compulsion with moral suasion as successfully as they had been united in the Red army. Russia was a State of small farmers and the transition to communism was hampered by difficulties greater than those which would have arisen in other conditions. For the attainment of their economic objects the assistance of the peasants was ten times more necessary than it had been during the war. The peasants were not Socialists. The Communist workers "must tell the peasants that it was impossible to continue freezing and dying of starvation indefinitely." If such conditions continued they would be defeated in the next chapter of the war. There must be a larger area of land under cultivation next spring, and there was no hope of salvation unless this economic victory was obtained. They recognized their obligation to the peasants. They had taken their bread in exchange for paper-money. They would compensate them as soon as industry was restored. The menace of Russia to the capitalist world could not be maintained without an improvement of economic life. As long as she remained a small farmers' country capitalism would find more favourable acceptance than Communism. The foundation and basis of their home enemy (capitalism) has not been removed. Electrification would help them to remove it.

Zinoviev admitted that the Soviet regime was degenerating through the influence of an immense and inefficient bureaucracy. He laid the blame on the traditions of the old administration:—

The utilization of bourgeois specialists in the work of economic and administrative reconstruction was absolutely essential and inevitable. The worst feature of this recourse to specialists was that they exhibit a red-tape attitude towards their work, not entering into the spirit of it: they have brought the worst habits of Government lethargy and bourgeois bureaucracy into our administrative organs. Those workers and peasants, whom the Soviet Government drew into direct participation in the Government, although they saw the weak side of these specialists, were themselves powerless to raise affairs to a higher level. Thus a wrong attitude was taken up toward those who worked by brain and not by hand. Workers who stand at the lathe are regarded as useful members of society, but what about the man who counts the lathes, who works out plans of production, who carries out essential statistical work? Such men are sometimes contemptuously described as bureaucrats.

The workers' and peasants' control must be transformed from an organ of supervision over the activity of Government institutions into an organization for attracting broad masses of the workers and the peasants to administrative tasks, for inculcating the methods of administration in accordance with the decree of the All-Russian Executive Committee dated Feb. 7 1920.

#### RUSSIA IN 1920-I

Soviet Russia had shrunk considerably by 1921 in comparison with the former Russian Empire. Instead of a population of some 180 millions it comprised in 1921 about 130 millions, of whom 10 millions were peasants and the rest were divided among the townsfolk and the nomadic and hunting tribes of the eastern steppes and of Siberia. It is estimated that the country lost 1,700,000 killed in the course of the World War, but it is impossible to form even an approximate conception of the number of those who perished from the indirect effects of the war through wounds, ill-health and privations, and of those who were destroyed by the massacres of the civil war, the misery of retreats and migrations, the epidemics of typhus, cholera, diphtheria which claimed a heavy toll in the unsanitary conditions of life. It would hardly be an exaggeration to put the number of victims of these disorders at some 10 millions. The abnormal increase of the death-rate has been definitely registered in certain cases, and there is good reason to suppose that in all centres where people congregated for political or economic reasons exceptional mortality prevailed and the health of the population was enfeebled through starvation and sickness. Petrograd, with 2,250,000 inhabitants in 1914, had been reduced to some 700,000, and Moscow to 1,000,000 instead of 1,800,000.

But, undoubtedly, the greatest inroads had been made by the separation of large territories that had acquired political independence. Finland accounts for a diminution of 3,000,000; Poland for 11,000,000; Estonia and Latvia for 3,000,000; Lithuania for 5,000,000; Georgia, Armenia and Azerbaijan for 8,000,000; Bessarabia for 3,000,000, the districts of White Russia and Volhynia, ceded to Poland, for 3,000,000.

*Economic Disruption.*—The great combination for economic intercourse guaranteed by the empire had been broken up to the detriment of most of its component parts. Of course, from the point of view of national separatism, the political independence of Estonia or Latvia was a great conquest, a glorious assertion of self-determination, and a source of profit in the helpless condition of Russia. These Baltic States serve as a kind of neutral fringe in which Bolsheviks can be met in safety by representatives of western Powers and western commerce. Gold from the Russian State reserves was being stored there, Reval and Riga serving as outlets for whatever trade was conducted with the west by the bankrupt Government of Moscow. Undoubtedly such a position, recognized by Europe and at the same time highly useful to the Soviet, might be a lucrative one. But these new-born States hardly realized sufficiently that sooner or later an account would have to be rendered to a Russia restored to its national traditions and strength. Such a historical Russia would hardly consent to leave the gates of the Baltic in the hands of alien Governments, who had done their level best to thwart its efforts at restoration in 1919, who manifested on every occasion their hostility to the Russian people and were in more dangerous proximity to Petrograd than Ireland was to London. The Bolsheviks had no objection to using Lettish mercenaries for repressing popular risings in Russia, and Lettish stockbrokers for commercial dealings with the west, but the Russian Government could not be expected to remain anti-national for ever. In the case of Poland the necessities of the industrial situation are quite as obvious as those of the commercial one. Polish industry thrived on the economic connexion with Russia. Without the Russian market Poland is economically a lifeless strip of territory: Germany does not want Polish manufactures; the only commodity it did want from Poland was cheap labour, but recent occurrences in Silesia and elsewhere show to what an extent national animosities have obstructed intercourse, even in this respect. It will be a long time before Poland will be able to use the outlet to the sea for the purpose of considerable trade and it is not likely to become ever a sea-power of some standing. In the meantime Poland in 1921 was practically bankrupt, with its currency enormously depreciated. It would certainly not seek reunion with Russia, but it might regret the opportunity it had in 1919 for helping in the restoration of a national government in Russia. Lithuania, with its unhappy situation in the intersection of the lines of action of three powerful neighbours—Germany, Poland and Russia—had to keep up a front primarily against the Poles as its most dangerous neighbours. As German protection was excluded by the policy of the Entente and especially of France, it seemed certain that the Lithuanians would sooner or later have to lean on Russia. But it would have to be a Russia with a civilized Government and a solid national basis. As for Rumania, the seizure of Bessarabia, though confirmed by decree of the Entente Powers, and the wholesale dispossession of Russian landowners, had not pacified the province, of which half the population belonged to the Russian stock and in which even many Moldavians were reputed Russophiles. The alliance between Rumania and Poland, concluded in the spring of 1921, might serve the purpose against a possible Bolshevik offensive, but would hardly help against a reconstituted National State. In the Caucasus again, the various alien nationalities are so intermixed and so hostile to each other that it was impossible to expect the rise of any local federation or even of durable peace: the Armenians, the Georgians, the Caucasian Tartars, as soon as they were free of their movements, were inclined to jump at each other's throats, and the necessity of a strong empire holding their appetites for self-determination in check was recognized even in 1921: it formed the background of the Soviet Govern-

ments artificially created in Azerbaijan, in Georgia and in Armenia. The factor of economic interdependence was also clearly to the fore: Georgians normally hate Armenians, though the rural population of Georgian stock wants the coöperation of the Armenians in the towns. The Tartars would fain swoop down on the people in the plains, and have repeatedly tried to do so, but after a time the necessity of drawing supplies from peaceful agriculturists and traders asserts itself among them. The oil treasures of Baku are of paramount importance to any Russian State and on the other hand these oil wells cannot be exploited without drawing supplies from a "Hinterland" furnishing food and manufactured articles. Above all, these regions can reckon on peaceful development only if there is a strong police force to keep the heterogeneous elements in order. Such a force could only be provided under existing conditions by Russia. Even the Bolsheviks had found access to this disturbed region as negotiators and pacifiers although their methods of pacification were of a peculiar kind—mainly the extermination or driving out of elements opposed to the Soviets.

On the whole there could be no doubt in 1921 that anti-Russian tendencies and political arrangements found their chief support in the absurdity of Bolshevik rule as well as from a recollection of the oppressive policy of the Tsarist period. A change for the better in the direction of freedom and democracy in Russia would render it possible to restore to some degree the economic and political ties which rendered fruitful the coöperation between these interdependent elements. As things stood, Soviet Russia was in 1921 deprived of important commercial outlets and industrial auxiliaries, and had to pay a proportionate price for such help as she could get from them.

*Commercial Intercourse.*—The curtailment of these resources was, however, of small importance when compared with the misrule of the Communist authorities in Russia proper. As a result of the civil war, of the proscription of trade, of the destruction of the middle classes, of the ruin of currency and credit, the processes of circulation had been impeded and blocked to such an extent that one had to look back to the Mongol invasions in order to find anything similar in magnitude to the misery of the situation up to the middle of 1921. The struggles in the Ukraine, with the repeated changes of rulers (democratic Ukrainians, the German protectorate, Petlura's bands, Bolsheviks, Denikin's White Guards, the Bolsheviks again, a Polish invasion, the Bolsheviks again), and the accompanying sequence of risings and punitive expeditions had made the south-western granary of the black soil almost unavailable for years to come. In the same way the Donets basin, the Cossack territories, the Volga provinces had been the scene of bitter conflicts and disturbances which had affected their productivity in a most unfavourable way.<sup>1</sup>

In 1921 one could hardly talk of a Russian railway system. It was already worn out to a great extent by the war and rendered useless for the bulk of the population by the strain put on it by military exigencies. The Soviet administration had been trying hard to effect the most urgent repairs as to rails, engines and trucks, and had utilized a considerable part of the gold reserve to buy locomotives and rolling-stock abroad. But the needs were so great and the engineering resources of Russia had fallen so low, that there was no marked improvement in this respect.

The restrictions as to trade had been relaxed lately, by the decrees of March 29 and May 17 1921, and a lame attempt had been made to revive trade, but all these concessions were too much in contradiction with other standing features of Communist policy to produce an extensive change in the situation. The fact

<sup>1</sup> Production of coal in the Donets basin for the first four months of 1913, 1919 and 1920 (in thousands of poods).

Months	1913	1919	1920
January . . . . .	143,000	36,600	14,000
February . . . . .	117,000	34,800	19,300
March . . . . .	156,000	33,300	24,300
April . . . . .	84,000	12,500	13,800
Total . . . . .	500,000	117,200	71,400

(Report of Lord Emmott's Committee.)

remained that the dictatorship of the Soviets had employed itself systematically on cutting the connecting nerves of the economic organism and had thereby produced a state of paralysis which it was out of question to heal by a few decrees.

One of the hateful consequences of this self-inflicted disorder was the severance between town and country. The rise and the growth of towns depend directly on ways of communication and the circulation of men and goods. They are primarily centres of distribution and exchange, and if the roads to them are obstructed they are unable to perform their economic functions of distribution and exchange. There was, of course, a secondary cause to their decay in "Sovdepia," namely the fact that they were centres of industry and affected by the ruin. But their decay as centres of commerce was bound in itself to produce a back flow of the population towards the villages. Such a back flow was especially indicated in Russia, where the distinction between rural and urban life was never a very marked one, and where large numbers of the inhabitants, such as cabmen, carriers, porters, small tradesmen, were recruited from the villages for a time and accustomed to return to their rural homes at certain periods of the year. In "Sovdepia" this mixed population tried to escape from the deadening grip of the Bolsheviks in the towns to the rural districts. It could live a freer life there, and, besides, it was nearer to the direct source of food-stuffs—the tilled soil. In this way the economic evolution of "Sovdepia" might be described as a regress from commercial to natural husbandry.

Another side of this process of "nationalization" was connected with the disappearance of the mainspring of flourishing commerce—credit. The causes of this phenomenon are partly of an economic and partly of a political nature. As the whole system of Communism is based on war against capital, no accumulation of wealth or resources should be allowed in private hands. This being so, no transactions can be carried out in the strength of confidence in a person's ability to meet engagements in the future. Cash payments and (in view of the worthless currency) barter are the only legitimate forms of exchange. To this must be added the effect produced by arbitrary expropriations by the renunciation of State liabilities, at home and abroad, by the absence of any legal security against dispossession. In such conditions there can be no talk of prosperous economic intercourse. Not the market but the barrack is the social center.

The will of a people to live cannot be entirely extinguished even by a Communist regime. Practice reacts by all conceivable means against the theory. Clandestine trade had been going on in Russia all through the years 1918–21. The Sukharevka market in Moscow teemed with people bidding all kinds of goods for sale. Those who succeeded in getting a passage by rail or by river-craft carried little stores of merchandise in sacks, ostensibly for their own use, in reality for trade purposes. What prices such contraband goods fetched was another matter: people had to pay fantastic sums for the risks incurred by the traders, besides making up for the depreciation of the currency. Anyhow the flow of speculation had never ceased in spite of all the decrees of the Soviet, and the rulers had recently made up their mind to recognize the existence and to admit in half-hearted way the legality of local trade (March 1921). This was proclaimed in the west as a great victory of common sense over extremist doctrine: it was in truth an inevitable admission which did not do away with the main causes of the disorder—insecurity, disruption of communications, distrust, corrupt and arbitrary interference by the commissars. As long as these causes continued to operate, the economic life of Russia would be suffering from their cumulative effects, and the social intercourse of the country was bound to be disturbed by the fever of fraudulent and rapacious profiteering in an atmosphere of misery and disease.

*Agriculture.—State of Peasantry.*—One of the first decrees of the Bolsheviks proclaimed the abolition of private property and the nationalization of the land. In practice this decree sanctioned the disorderly grabbing of estates by the adjoining peasantry, and the new rulers connived at this form of appropriation for the sake of its psychological effect as a revolutionary act. This meant that they renounced "nationalization" at the same time

as they professed to carry it out, and although they tried to save their face by distinguishing between the ownership attributed to the republic and the possession of land snatched by the peasants, the fact remained that the October Revolution as translated into agrarian terms meant the passage of some 50 million dessiatins (135 million ac.) from former landowners into the hands of "petty bourgeois" of the peasant class. The fact that some of the new proprietors held in village groups while others held in individual homesteads did not alter the fundamental opposition between the two social conceptions. The history of the years of Soviet domination up to July 1921 showed that the Communists did not realize at once the consequences of the agrarian revolution registered by their decree. They strove to carry out their programme of nationalization in two directions: they kept in the hands of the Commonwealth a considerable number of estates which had belonged to the State, the Imperial family and certain private landowners—they based their policy of food supply on the principle that the peasants were tenants at will of the republic liable to unlimited exactions for the benefit of the whole.

Under the first head a series of measures were adopted for the exploitation of estates on communistic principles. In the peculiar terminology of the Soviet a number of "Sovkhoses" and "Kolkhoses" were carved out of the land fund and put under the economic control of the administration. The "Sovkhoses" were economic organizations carried on under the immediate direction of the Government while the "Kolkhoses" were communes and associations of peasants enjoying economic support from the Government. Sovkhoses either carried on agriculture in general or cultivated special kinds of technical plants such as beetroot or tobacco. In the first case the Sovkhoses were mainly organized as colonies of industrial workers fitted out with agricultural implements of all kinds, cattle, seeds, etc. The object was to make town workers more independent of the "yoke" of the villages by giving them the opportunity of growing their own corn and vegetables, managing their own dairy farms, etc. These annexes of the factories, designed to rear privileged proletarians in a healthy atmosphere of occasional rural occupation and to provide the surrounding villages with examples of model farming, proved a dismal failure. According to a report presented to a congress of agricultural workers in July 1920 the delays and red tape of administrative patronage rendered the condition of the proletarian husbandmen exceedingly precarious.<sup>1</sup> And as for the workers it could not be expected that they would be able to give satisfaction in their amphibious pursuits. The progress of the Kolkhoses was not more successful. Some were started as actual "communes" with individual coöperation and individual "profits," and those were doomed to be a failure; other Kolkhoses merely drew assistance from the Government, and had to encounter the hostility of neighbouring, less-privileged villages. The negative results of this experiment may be gauged from the fact that the number of Kolkhoses in action decreased in one year from 1,900 to 1,500.

The immense area covered by peasant tenures on the old lines was little affected in its constitution by the Bolshevik usurpation. The attempt of the Soviet to bait the well-to-do peasants by the needy folk proved that the Communist intellectuals did not know the material with which they had to deal. There was no "village proletariat" to speak of, which could serve as a basis for the intended subversion of social relations in the villages; and such tramps and drunkards as the Bolsheviks were able to bring together in their crusade against welfare and order did not succeed in effecting much more than occasional disturbances, which ended mostly in the suppression of the "needy folk" by the peasantry.

<sup>1</sup> According to the decree of June 8 1919, the control of the Sovkhoses farms was given to the Glavsemkhose (the Central Board of Agriculture), which (1) united all agricultural farms organized by the industrial proletariat; and (2) united all the central boards controlling those branches of industry which were in need of agricultural plants for their production, such as "Glavskhar," "Glavtabak," "Glavkrachmal," "Centrochai," and "Pharmacentre" (*Economic Life*, Oct. 2 1919). The original area allotted to different industrial boards amounted to 200,000 dess. (540,000 ac.), but the area actually distributed amongst them was much smaller, amounting only to 80,000 dess. (*Russian Economist*, Jan. 1921).

Much more irksome were the requisitions and expropriations exercised in virtue of the eminent ownership of the Commonwealth. The Soviet was constrained to fall back on this means of extracting some supplies for feeding the army and the towns, but the decrees enjoining the confiscation of the entire produce with the exception of the quantity necessary for the subsistence of the husbandmen, could not fail to provoke a stubborn resistance. The answer of the peasantry was that the farmers restricted the area under seed to the extent necessary to feed them and their families. Why should they toil to increase cultivation if the fruits of their labour were to be taken from them? According to a Soviet authority (Larin) the quantity used for cultivation had shrunk from 5 milliard poods in 1917 to 2½ milliard poods in 1920. The Soviet Government brought all the weight of its terroristic coercion to bear against this passive resistance. It sent punitive expeditions, it encouraged its privileged proletarians to raid the countryside for supplies, it issued a decree ordering the maximum of available soil to be taken over in cultivation and threatening recalcitrant farmers with confiscation and imprisonment: all in vain as far as the general results were concerned. The hardships and disorder were increased hundredfold, but it proved impossible to drive a mass of 100,000,000 peasants by the whip to perform work which was distasteful to them.

The Soviet dictators had to acknowledge their defeat, and in the spring of 1921 (on March 23), in view of a threatening famine, a decree was issued by the Executive Council of the Soviet recognizing and guaranteeing the private tenure of householders who would conform to the payment of a tax in kind. Instead of charging the provinces with certain lump sums to be partitioned among the *uyezds* (districts) and, lower down among the *volosts*, and to be collected from the harvest according to the requirements of the Government, a land tax was imposed which had to be assessed according to the outfit and means of each separate household. It was calculated that this substitution of a land tax for the system of repatriation amounted to the reduction from 470,000,000 poods of corn to 250,000,000. It remained to be seen whether the business of assessing and collecting the tax could be carried out with sufficient skill and fairness. The one positive asset of the revolutionary period from the point of view of the peasants consisted in the passage of land from the squires to the tillers, and this was certainly a conquest which the villagers were not going to give up. All attempts at political reconstruction would have to reckon with this basic fact.

**Industry.**—The history of industrial economy presents the same features, and describes the same curve, from partial disorganization through blockade and war to general ruin in consequence of absurd Utopianism, and, ultimately, to desperate attempts to reconstitute production by reverting to methods condemned and destroyed by the Communists. There is, however, a notable difference: while the enormous block of the rural population was able to oppose unconquerable passive resistance to the dictators in spite of terrorism and heavy losses, the scanty stratum of the industrial workers was almost worn out in the struggle.

We have again to start in our survey in the case from the years immediately preceding the Revolution. Bolshevik experiments were the culminating phase of a process of destruction which had started long before the Oct. 1917 upheaval: the guilt of the Communists consisted in the fact that instead of fighting the evil, they did everything in their power to aggravate it. The initial stage of industrial decay dates from the time when Russia was isolated from western resources by the Central Powers in alliance with Turkey and Bulgaria. The country had to attempt the impossible task of providing by its own primitive resources for the tremendous technical requirements of the war. The criminal levity of Tsarist administration under men like Sukhomlinov had left it with exhausted equipment and munitions by the end of some nine months of military operations, and an unsolvable problem was set to its patriotic leaders in 1915; they had to make up the deficiencies and to prepare further efforts. This meant technically that all the coal and all the railway machinery had to be diverted for the use of the army while the economic needs of the population were entirely disregarded. As a result, though,

with the help of Zemstvo and Municipal Committees acting for purposes of national defence, the fabrication of shells and machine-guns was to some extent reestablished and maintained, the economic work in the rear necessary for production and repairs was rapidly deteriorating. Train service, for example, was officially suspended for weeks between Petrograd and Moscow in order to make room for military transport and the most urgent needs of food supply. Repairs of locomotives had to be carried out in a more and more imperfect and insufficient manner, and the statistics as to the state of rolling-stock presented drastic symptoms of a lamentable deterioration. The March 1917 Revolution accentuated all these evils because another cause of decay came to the fore with ever-increasing force: the discontent and the demoralization of the workers broke out like a stream of all-consuming lava. The responsibility for the sufferings of the time was laid entirely at the door of greedy capitalists, and the workers were convinced that they were justified in demanding increased wages and decreased labour. A Minister of Labour of the Provisional Government, Skobelev, upheld emphatically their contention.

The following tables give illustrations of the change in the condition of the rolling stock:—

## Engines.

Year	Length of the Lines, in Versts	Number of sound Locomotives	Per cent. of Locomotives out of order	Number of sound Locomotives per 100 Versts of Line
1914 . .	64,000	17,000	15-16	27-28
1916 . .	65,000	16,000-16,800	16-17	26-27
1917, Jan.	64,526	17,012	16-5	26
June	62,952	15,930	24-2	25
Dec.	50,131	15,810	29-4	32
1918, June	25,422	5,676	39-5	22
Dec.	23,665	4,679	47-8	21
1919, June	24,688	4,739	49-0	19
Dec.	36,551	4,141	55-4	11
1920, Jan.	48,410	3,969	58-1	8
June	59,196	6,254	58-9	10-5

## Repair of Engines.

	1915	1916	1917	1918	1919
Number of Engines repaired	797	1,177	640	405	25 21

## Construction of New Engines.

Year	Number of new Engines constructed in Russia
1914 . . . . .	816
1915 . . . . .	903
1916 . . . . .	599
1917 . . . . .	396
1918 . . . . .	191
1919 . . . . .	85

In the cotton industry of the Moscow district the earnings of skilled and unskilled workmen per day was as follows:—

Date	Unskilled workers		Carpenters of the first category	
	In kopeks	Per cent. 1919 = 100	In kopeks	Per cent. 1919 = 100
Easter 1914 . .	46	2	155	3-9
Easter 1915 . .	57	2-5	160	4-0
Dec. 1915 . . .	59	2-6	175	4-4
Easter 1916 . .	68	3-0	200	5-0
Jan. 1917 . . .	68	3-0	250	6-2
Aug. 1917 . . .	145	6-3	575	14-4
Dec. 1917 . . .	800	34-8	1,950	48-7
June 1918 . . .	1,000	43-5	2,050	51-2
Sept. 1918 . .	1,000	65-2	2,650	66-2
Feb. 1919 . . .	2,300	100	4,000	100

All partial attempts to put a stop to constant rioting, absenteeism, and slackness availed nothing against the general intoxication of the "glorious revolutionary days."

Working Year of the Industrial Workmen in Days.

	Pre-revolutionary	Post-revolutionary	Increase since Revolution	Per cent of Increase
Stoppages . . . . .		53	53	157
Sickness . . . . .	7.4	19	11.6	
Absence for other causes . . . . .	16.6	52	35.4	214
Total of days absent . . . . .	24	124	100	416
Days of rest . . . . .	93	55	38	41
Days of work . . . . .	248	180		
Total . . . . .	365	365		

The table shows that, notwithstanding the large decrease in the number of holidays after the Revolution, the working year of the workman, owing to the increase of sickness, absence from work and stoppages, has decreased by 68 days, or 25%; and if, further, the length of the working day be taken in account, in 1916, including overtime 10-11 hours, and at the beginning of 1920, 8-6 hours, then the decrease of the working year amounts to 900 hours or 30 per cent.

The Bolshevik victory in Oct. 1917 added yet another ingredient to the industrial ferment. The Marxist dictators, the industrial workers, were the chosen class, the leaders of the proletariat, and entitled therefore to carve out benefits and indulgences for themselves according to their own notions of right and expediency. More especially they were keen to ransom the employers' class, not only by appropriating the lion's share in actual profits but by exacting compensation for advantages which had accrued to employers in the past, as well as vengeance for ill-treatment of the workers in the course of centuries. The inference from this conception of economic relations between working men and their former employers was the system of *workers' control*<sup>1</sup> which the Soviets started in their industrial policy. It meant that each factory and workshop had to be conducted in the future under the supervision and according to the directions of a board of workmen, while the employers were degraded to the position of technical experts and banking managers.

The object of the peculiar combination between Capitalism and Socialism designated as "workers' control" was avowedly to enable the workmen to draw on the resources of the capitalist to the last drop, and in this complete success was achieved thanks to the servitude imposed on the "employer" who could neither withdraw nor oppose any decree of the workman's board. But the system had yet another effect, namely a complete industrial anarchy and consequent ruin.

The next stage was reached when the Soviets attempted to put an end to this anarchy by a regime of nationalization.<sup>2</sup>

<sup>1</sup> The Workers' Control was established by the decree of Nov. 14 1917. It directed the production, sale and storage of products and of raw materials and the administration of the financial side of the business. It belonged to all workers by the intermediary of their elected institutions with the participation of representatives of the employees and of the technical staff.

The situation in the factories became chaotic, and the disorganization of the undertakings assumed the most extraordinary dimensions. The interference of the Workers' Committees made it quite impossible to realize any scheme planned in advance. All programmes of economical policy were annulled by the "judgment" of the Workers' Committees.

<sup>2</sup> In the course of a report delivered to the Moscow Congress by the Supreme Council of People's Economy in Jan. 1920, A. I. Rykov, the president of the Council, made the following statement:

"The nationalization of industry has been carried out pretty fully. In 1918, 1,125 factories and works were nationalized, and by the end of 1919 the number was about 4,000. This means that nearly all industry has passed into the hands of the state (Soviet) organs, while private industry has been destroyed, as former statistics show that there were up to 10,000 industrial undertakings, including cottage industries. These latter are not subject to nationalization, and the 4,000 nationalized factories and works include not only the larger concerns, but likewise the bulk of the average industrial concerns of Soviet Russia. Of these 4,000 undertakings about 2,000 are working at present. All the rest have been closed. The number of operatives is estimated approximately at 1,000,000, which is between one-third and one-fifth of the numbers of the proletariat in 1914. Both as regards the number of hands and the number of undertakings in operation the Russian manufacturing industry is likewise undergoing a crisis."

Nationalization could be introduced into practice only by deriving economic direction and control, not from the accidental and separate groups of workmen in factories and workshops, but from the national centre. This centre was embodied in the Economic Council of the people, supported locally by subordinate councils in the provinces and districts, and relying for the execution of its decrees on a vast bureaucracy of head offices (Glaski) and "centres."

It is difficult to form an adequate opinion as to the ramifications and numbers of this all-embracing bureaucracy. We have the evidence of its own members as to the actual working of the system. In theory it had to organize the repartition of raw materials, to assign means and draw supplies and to collect products in accordance with requirements. In reality the Soviet bureaucrats struggled with each other, stifled local opinion and individual enterprise, and had generally to record lamentable discrepancies between plans and achievements.<sup>3</sup>

Bureaucratic nationalization proved as ineffectual as workmen's control in solving the problems of increased production and organization of labour. Theoretically, the workmen in the nationalized industries had to be considered not as privileged beneficiaries but as disciplined citizens serving the Commonwealth. Attempts to translate this view into practice were made. Workmen were mobilized for industrial purposes, sent to the Urals or to the Donets fronts, subjected to military control and martial law, armies that had been fighting the Poles or Denikin were switched off to execute economic tasks. Trotsky developed the idea of the militarization of industry as the only means of saving the country from collapse. But the results were not encouraging. Workmen deserted from the towns and hid in the villages, while those unfortunates who were unable to leave Petrograd, or other industrial towns, went on strike, made demonstrations and riots in the face of ruthless repressions; even when they performed their hard labour, it proved miserably inadequate for lack of physical health and moral energy.

Altogether, industrial nationalization proved as much of a failure as agricultural nationalization. And so the Soviets had to retreat, here as there, to a position characterized by the abandonment of all their economic doctrines and previsions. In 1921 Comrade Krassin was recommending in the West a programme that Lenin had announced to the 10th Congress of Communists and to the Central Executive Council: capital and competent leadership were acknowledged as necessary forces in the process of industrial production: the national capitalists had been robbed and driven from Russia; therefore foreign capitalists had to be called in to take their place. They were promised guarantees against arbitrary expropriation "*à la Russe*" and they might think that they were less liable to succumb to it because they were not "comrades" but citizens of civilized states, and might count on the strong arm of their Governments. But the great inducement consisted obviously in the prospect of rapid profiteering on a scale commensurate with the risk incurred by those who ventured into the wolves' den.

In comparison with these gigantic schemes of exploitation other retrograde measures were modest and mild. Small capitalists, even when Russians, were allowed to start shops, and individual enterprise was to be encouraged somehow, although Communism was not renounced as an ideal, and big undertakings were to be kept in the hands of the State. The introduction of

<sup>3</sup> From Jan. to June 1918, the Soviet regime at the Putiloff factory gave the following results:—

	Delivered	Provision
Engines, new . . . . .	2	4
Engines, new type . . . . .	1	3
Engines, important repairs . . . . .	2	10
Engines, medial repairs . . . . .	0	12
Carriages, 3rd class, new . . . . .	2	4
Carriages, 4th class, new . . . . .	3	13
Carriages, for goods, new . . . . .	169	309
Tramways . . . . .	3	9

The real productivity of the factory is from 3 to 10 times inferior to those of the scheme of production established by the superior Council of National Economy. (Report of Mr. Molitof to the Petrograd Soviet, Aug. 15 1918, Labry, 187.)

specialists was recommended as a necessary measure. Under the regime of the workmen's control, technical experts were treated as second-rate persons to be ordered about by the ignorant "demos" of proletarian boards, but experts were now invited to proceed to Sovdepa in order to help to restart productive industrial activity. In the factories piece-work was given a prominent place as against the "ca'canny" devices of time work, although previously workmen used to protest most violently against this form of remuneration. Altogether payment by results was being more and more recognized as an antidote against slovenly labour. As for working hours no account was taken of the 8-hour day, and forced labour was exacted for 10 or 12 hours when deemed necessary by the commissars.

*Standard of Living.*—Thus the Soviet dictators were trying in 1921 to back out of the impassé into which they had run the industry of the country. There was among the working class one group which had profited by the Oct. revolution—it was the communistic nucleus used by the Soviet administration to spy on their comrades and to coerce them. They enjoyed all the privileges of an official class and could afford not only necessities of life but such luxuries as were to be had in the market. Apart from these privileged Communists the working class was reduced to a condition of utter destitution. Even judging by the standard of the prices fixed from time to time by the ruling powers they could not make the two ends meet, because the prices had risen during Soviet domination from 16 to 25 times. In 1921 bread cost 19 times as much as in the second quarter of 1917, manufactured goods 22 times as much, footwear and soap 25 times. Wages indeed had increased also, but their nominal increase did not keep up with the cost of living. About the middle of 1918 an *enquête* had been made in Moscow as to the budgets of 2,173 workmen, and it resulted from it that on the average a bachelor working-man's wages did not exceed 462 rubles per month, though by occasional extra work they might be brought up to 624. The head of a family earned on the average 703 rubles, and might increase his earning by supplementary labour to 1,077 rubles per month. The ordinary budget was made up in the case of a bachelor by 22.2 rubles for lodging, 46.9 for food, 47.7 for clothing, 1.1 for house implements, 10.6 for health (baths, drugs, etc.), 13.4 cultural expenses (newspapers, books, etc.), 13 (parcels sent to village home), 32 miscellaneous expenses; in all, including other items, being 609 r. For heads of families the average monthly expenses rose to 952.7, of which 672.8 r. fell on food (Zagorsky, *La République des Soviets*, 214, 215). These figures show a considerable deficit in normal and well-regulated households: any disturbance in personal conduct, conditions of labour or health, was bound to result in downright starvation and ruin. Let us also notice that distress was much more marked in 1920 and 1921 than in 1918.

The only consolation for workmen was derived from the fact that the hated bourgeois were subjected to even greater hardships. In the early stages of Bolshevik domination this kind of consolation was a potent one: the feeling of triumph of the lower class over its former superiors made up for many privations, but in course of time the bourgeois were trodden down to that extent that there was not much satisfaction to be obtained from kicking them, while new contrasts arose between the mode of life of half-starved workers and of the Soviet bureaucrats shepherding them. The food situation became catastrophic in 1921. As a result of the restriction of cultivation, transport difficulties and civil disorder, a great part of the country was visited by downright famine, with terrible prospects ahead.

*Credit and Finance.*—In such conditions nothing could be expected but growing decay in public credit and finance. The Soviet Government had been living on the reserves accumulated under monarchical rule. The gold fund of the Imperial Treasury had been its chief asset in conducting political and commercial negotiations. Its remnant represented something like £50,000,000 in the first quarter of 1921. The needs of the home circulation were satisfied by constant emissions of paper notes. There was no system and no limit in this process of inflation. Paper notes had even come to be measured by weight instead of being

reckoned at their indicated value. The Chief of the Soviet State often spoke with contempt of money currency as a worthless product of capitalistic exploitation. But the Communist Commonwealth had not yet discovered the means of replacing this system by a more adequate instrument of exchange. Figures in rubles were still being handled as if they represented realities. The only hope left for the Bolsheviks was that when they had spent the reserves captured from the Imperial Government and from the defeated armies, the national capital represented by the natural wealth of Russia in forests, minerals, fisheries, etc., should be put into the market. The handing over of this wealth to foreigners would mean, of course, economic subjection, a state similar to that of Asiatic and African dependencies of western Powers. But the Bolsheviks were not deterred by a prospect of that kind, provided it enabled them to continue in power. They mapped out a programme of concessions on the widest scale.

The Council of the Commissars of the people laid down a set of rules as to concessions, and the Councils of Economy and of Agriculture outlined a vast scheme of natural resources which should be offered to foreigners for exploitation. The rules were as follows:—

- (1) Concessions should be granted by agreement on the principle of a division of profits.
- (2) In case of the introduction of special machinery and appliances the concessionnaires would be granted privileges, e.g. large orders.
- (3) The concessionnaires would be allowed to remain in possession for long periods in order that they should draw sufficient benefits from their concessions.
- (4) The Government of the Soviets guaranteed immunity to the concessionnaires from nationalization, confiscation and requisitions.
- (5) The concessionnaires would have the right to hire labourers on conditions specified in the Laws of the Commonwealth or on special conditions safeguarding the life and the health of the workmen.
- (6) The Government pledged itself not to make any change in the conditions of the agreement by a one-sided exercise of its authority.

It would be impossible to enumerate all the resources of the country offered to enterprising capitalists for exploitation. Two or three examples must suffice to give an idea of the booty offered to foreign capitalists by Russian Communists. In Western Siberia, along the rivers Ob, Irtysh and Taz, an area of 70 million dess. (about 180 million ac.) was reserved for them. It is covered by immense forests of pines, firs, cedars and larches. If it were found necessary at the start to restrict exploitation to a strip along the rivers some 15 versts wide along each bank, there would still be available for immediate and easy use some 16 million dess. (about 42 million acres). The timber should be sawed and worked into pulp and cellulose in mills to be erected by the estuary of the Ob. Such mills ought to make up a settlement of the size of another Archangel. The natural route westwards lies down the Ob and by the Kara sea: it had already been utilized to some extent and its future importance could not be exaggerated. The whole region should be opened up by a number of railway lines. Mineral wealth of various kinds—platinum, coal, lead—is to be found in these districts. One of the most stupendous advertisements as to mineral wealth concerned the Kuznetsk coal mines along the Tom river. They were estimated to contain about 250 million tons of excellent coal. In European Russia 14 uyezds (districts) were advertised for agricultural exploitation and the construction of ways of communications of all kinds. All these districts are situated in the black soil region of south-eastern Russia. The application of powerful traction engines and steam ploughs would soon convert them into one of the principal granaries of Europe.

Such were the prospects held out in 1921 to enterprising capitalists. Not a word was wasted on the social and legal conditions of the human material connected with these tracts. It remained for the concessionnaires to fashion it with the assistance of the enlightened commissars: it was evident that the 5th clause of the Soviet rules ought not to be applied in such a way as to hamper the great process of economic restoration. The principal object was to get capitalists to speculate on the material basis described with such graphic details.

It remained to be seen how they would organize and keep in order the labouring population required for the carrying out of

the concessions—whether the foreign capitalists would obtain feudal franchises with police powers of their own, or the Soviet power would keep watch on their behalf and use coercive measures to keep the Russian workmen up to the mark.

Another side of the repressive policy of the Soviets in the stress of dire need was presented by the appeal to the help of coöperatives. These organizations had gone through a chequered existence under the rule of the Soviets. In the early days of 1917 and 1918, the proletarian dictators used them as convenient tools at home and abroad in order to counteract the impression that Russia was ruled by an uncompromising despotism. The leaders of the coöperatives were encouraged to preach a non-party attitude, and to concentrate their efforts on purely economic work without any admixture of political opposition. In the campaign for the reopening of trade with Soviet Russia it was usual to assert that such trade would be carried on exclusively with coöperators and not with the ill-famed Moscow Government. In 1919, however, a sharp turn was given to the wheel, and the coöperatives were "nationalized"—declared to be subordinate committees of the Central Economic Council. In Sovdepia this measure was explained not only as a consequence of the general policy of Communism, but also as a necessary precaution against Social revolutionaries and Mensheviks, accused of having barricaded themselves within the coöperatives for purposes of political agitation.

In the beginning of the year 1921 a new current set in: coöperatives were to some extent reestablished as autonomous organizations. The object was to revive them as agents of repatriation. The Soviet decree of April 7 1921 was drawn up, however, in such a narrow and ambiguous form, that the institution remained doomed to mechanical subjection. The Act concerned primarily coöperatives of consumers. It allows combinations for protection and traffic only in an exceptional case and in obscure terms. As far as allowed, coöperatives are included in administrative units of state origin and local delimitation. All freedom of action is curtailed and subjected to strict supervision. Lastly, the members are not voluntary associates intending to help each other according to free agreement, but people brought together by the fact of dwelling in the same locality or belonging to the same professional group.

All this shows to what extent the principle of autonomous association was felt to be antagonistic to Soviet despotism. It might be assumed that the coöperatives would either remain inactive and fictitious, or else that they would contrive to escape the jealous supervision and the step-motherly pressure exercised by the "Glavki" and "centres."

The hard facts of economic decay admitted of no controversy and could be illustrated by tabulated results. It was still impossible in 1921 to apply the same tests to the moral aspect of the condition of Russia, although there could be no doubt that the deterioration of national life in this respect was more harmful than economic decay. The aggressive tone of Communist propaganda could not deceive any one who considered the efforts of the "Proletcult" with common sense. It was not the number of schools that mattered, but their efficiency and educational influence. The prophecy of Dostoevsky in *The Possessed* had come true: the Bolsheviks had not only squandered the reserves accumulated by orderly government, and scattered some 2,000,000 of the best educated Russians across the world—they had poisoned the mainsprings of national morals for generations to come. One or two of the conclusions of Lord Emmott's Committee may be appropriately cited in this connexion; their studied moderation makes them particularly effective:—

"Child education in Soviet Russia is based upon an attempt to dissolve the ties hitherto existing between parent and child, and children are removed from the care of their parents soon after birth; we have received no information on the moral and physical effects of this policy. Education, both child and adult, is not merely secular, but directly anti-religious in bias."

As a specimen of the educational practice of Soviet Russia we will quote from the experience of a leading professor of the medical faculty of the university of Moscow, published under the

pseudonym of "Donskry" in the *Archives of the Russian Revolution*, I (Berlin, 1921):—

"By order of the commissars 5,000 applicants had been admitted as freshmen in the medical faculty, although the lecture-rooms were constructed for 250. Representations had been made that it was impossible to admit persons who had received no appropriate instruction, but they were disregarded. The only thing required was that applicants should have attained the age of 16 years—the rules as to admission did not mention even the necessity of knowing how to read and write. The crowd of students dwindled to small numbers very soon, however, on account of the absence of heating during the winter and of the almost insuperable difficulty in getting materials for experimental teaching."

**RUSSKY, NIKOLAI** (1854–1918), Russian general, was born in 1854. On leaving the infantry military school in St. Petersburg in 1874 he was given a commission in the Guard. Graduating from the Academy of the General Staff in 1881, he served as an officer of the general staff in the Kiev military district, and by 1896, after commanding an infantry regiment, had reached general's rank. During the war with Japan in 1904–5 he was the head of the staff of the II. Army, and planned the offensive carried out by Gen. Gripenberg which led to the prematurely abandoned offensive of Sandepu. In 1909 he was assistant commander of the Kiev military district. He enjoyed the special friendship of the War Minister, Sukhomlinov. At the beginning of the campaign of 1914 he commanded the III. Army, which attacked in Galicia, and after the vicissitudes of the bloody heavy battles about Krasnik and Rava Ruska advanced to Lvov (Lemberg), through which it passed in the further advance to the San-Dniester line. The dramatic entry of the III. Army into Lvov created for Gen. Russky a popularity and prestige out of proportion to the real importance of his success. In Oct. 1914 he was appointed commander-in-chief of the north-western and afterwards of the northern "front" (i.e. group of armies), but, suffering from very bad health, he had on more than one occasion to leave the front for a time. He continued, however, to hold the command, and it was at his headquarters that the final scenes of Nicholas II.'s reign and his abdication took place in March 1917. Soon after the Revolution Russky retired and in 1918 he was reported killed by the Bolsheviks.

**RUTHERFORD, SIR ERNEST** (1871— ), British physicist, was born at Nelson, New Zealand, on Aug. 30 1871. He was educated at Nelson College and Canterbury College, Christchurch. After graduating at the New Zealand University (M.A. 1893 and B.Sc. 1894), he proceeded with an 1851 science exhibition to Cambridge, where he entered Trinity College and prosecuted researches in the Cavendish laboratory, Sir J. J. Thomson being then the Cavendish professor. He published numerous researches upon the conduction of electricity through gases, for which he obtained the B.A. Research degree and the Coultts-Trotter studentship in 1897. In the following year he was appointed Macdonald professor of physics in McGill University, Montreal. There he carried out a series of brilliant investigations, in conjunction with Soddy, which established upon a firm basis the existence and nature of radioactive transformations. In 1903 he was elected F.R.S. In 1907 he succeeded Sir Arthur Schuster as Langworthy professor of physics in the university of Manchester, and he attracted there a large school of radioactive research workers. In collaboration with several of these the science of radioactivity was rapidly developed: among other work the production of helium as a product of disintegration of radium was shown spectroscopically, the spectrum of the emanation measured, the number of  $\alpha$  particles (charged helium atoms) during a disintegration process counted, the properties of numerous radioactive products and the radiations accompanying their formation examined. Among the most important of the researches emanating from his laboratory was that of the experimental demonstration of the nuclear nature of the atom. It was also in his laboratory that Moseley determined the X-ray spectra of a number of elements. Rutherford was knighted in 1914 and in 1919 succeeded Sir J. J. Thomson as Cavendish professor of experimental physics in the university of Cambridge. Many British and foreign honours and degrees were bestowed upon him: the Rumford Medal of the Royal Society (1905), the Barnard Medal (1910), Bressa Prize (1908), and Nobel Prize for chemistry (1908). In 1920 he was appointed professor of physics at the Royal Institution, London. His works include *Radioactivity* (1904), *Radioactive Transformations* (1906), *Radioactive Substances and their Radiations* (1912).

**RUTHERFORD, MARK** [WILLIAM HALE WHITE] (c. 1830–1913), English author (*see* 23.940), died at Groombridge March 14 1913. His eldest son, **SIR WILLIAM HALE WHITE** (b. 1857), who was created K.B.E. in 1919, became a well-known physician, and during the World War was a colonel in the R.A.M.C.

**RYAN, JOHN DENIS** (1864— ), American capitalist, was born at Hancock, Mich., Oct. 10 1864. He was educated in the public schools, for eight years was clerk in an uncle's store, and at the age of 25 went to Denver, where he was employed as a salesman of lubricating oils. In 1901 he secured an interest in a bank at Butte. In 1904 he was made manager of the Amalgamated Copper Co. in Montana, and after the death of Henry H. Rogers, in 1908, he succeeded him as president. He had been elected president of the Anaconda Copper Mining Co. in 1905, and after the merging of the Amalgamated interests in the Anaconda in 1910 he continued as president of the latter until 1918. He developed large water powers in Montana, and in 1913 electrified the railway between Butte and Anaconda (100 m.), the success of which led to a wide introduction of electrification. By 1920 hydroelectric power from the Montana Power Co. organized by Ryan was used in most of the mines of Montana and for lighting in all parts of the state. During 1917–8 Ryan was a member of the war council of the American Red Cross and after 1918 of its central committee. After the failure of America's aircraft programme had led to a reorganization, he was appointed in April 1918 head of the Aircraft Board of the Committee of National Defence, and in Aug. was appointed second assistant-secretary of war and director of air service of the U.S. army. After the signing of the Armistice in Nov. he resigned. Official investigation was made later, and Ryan was both attacked and defended. It was generally felt that the newly organized board fell heir to popular criticism of past failures for which it was not responsible, and the short time before the Armistice scarcely afforded opportunity to develop efficient production. In 1919 Ryan was elected chairman of the board of directors of the Anaconda Copper Mining Company, and he took a prominent part in connexion with other commercial and financial concerns.

**RYDER, ALBERT PINKHAM** (1847–1917), American painter (*see* 23.949), died at Elmhurst, Long Island, March 28 1917.

**SAAR VALLEY.**—The Armistice of Nov. 1918, in restoring Alsace-Lorraine to France, again brought the French frontier close to Saarbrück and the Valley of the Saar. This region, thanks to its large coal output, had ever since 1871 been in close relations with the coal-mines of Metz and Thionville. The big metallurgical establishments of Lorraine were largely dependent upon coal from the Valley of the Saar, from which the new French frontier would have cut them off, to the detriment of the economic development of both countries. On the other hand, France had been deprived of a large portion of her output by the destruction of her northern coal-fields, a situation which had as far as possible to be remedied by Germany. The geographical situation of the coal-mines in the neighbourhood of Saarbrück clearly pointed to their utilization for this purpose. Nevertheless, and although Saarbrück had belonged to France from 1794 to 1815, the French annexation of this country was difficult without running a risk of violating the inhabitants' right of self-determination. These were the elements of the problem which the authors of the Treaty of Versailles had to consider.

**Treaty Stipulations.**—Section IV. of Part III. of the Treaty deals with the Saar Valley. Articles 45 to 50 lay down the frontiers of the Saar territory, and state the general principles adopted. The régime agreed upon is laid out in an annex which follows Article 50. It is clear from the text that the authors of the Treaty intended to cede to France complete ownership of all coal deposits in the valley. This could not have been effected had the district remained under the authority of the German Government. Disturbances were to be feared between the French State, sole proprietor of the mines, and the German Government, which would have remained the only public authority. In order to get over this difficulty, and to ensure to France the free disposal of Saar coal, the territory of the Saar was completely detached from the German State, both from a political as well as from an administrative point of view.

**Frontiers.**—The territory (see EUROPE, inset on map) as created by the Treaty stretches W., N. and E. of the town of Saarbrück (60 km. E.N.E. of Metz, and 90 km. N.W. of Strassburg). On the S. and the W. there is the French frontier, from Hornbach, S. of Deuxponts, to Ritzing, W. of Merzich (Merzig). Leaving Ritzing, the frontier includes Mettlach and its suburbs, passes near Neuenkirchen, and, going E. reaches the southern frontier of the Birkenfeld district, which it follows. From Namborn the line goes S.E., taking in Homburg, and, after bending so as to exclude Deuxponts, rejoins the French frontier near Hornbach. The territory thus formed is considerably larger than the district where coal-mines are actually being worked. The peace negotiators intended, in fact, to include in it the whole coal deposit, and not only the fields being exploited. France has become sole owner of all the fields and of all mining concessions. Indemnification of the former owners was made the concern of Germany. Transfer to France of the mines being worked was made comparatively easy by the fact that nearly all the concessions belonged to the State of Prussia or to Bavaria. The rights of France in the district were still further guaranteed by the inclusion of the district in the French Customs system. This provision had extremely important economic and political effects. However, in order to avoid a brutal cessation of the close economic relations which existed between the Saar and the rest of Germany, trade with Germany was to remain free of any Customs dues until Jan. 10 1925. France was empowered to build any railways or canals which she might deem necessary in order to link up the fields with France. All the rights and duties of the former proprietors towards their employees and workmen were assumed by France, who was also free to use French currency in all its transactions within the zone. The value of the mines thus ceded was to be credited to Germany in the Reparations Accounts.

**Political Régime.**—Steps had to be taken to provide the dis-

trict with administration and government, France, apart from the mines, being concerned only with Customs. The Peace Treaty entrusted the League of Nations with this task, as from Jan. 10 1920. The country is governed by a commission of five, which sits at Saarbrück, and consists of one French member, one member chosen among the local population, and three who may be neither French nor German. This commission is appointed yearly by the League of Nations, which may renew expiring mandates. It is presided over by one of its number, appointed by the League of Nations. This president acts as executive agent. All powers previously enjoyed by the German Empire, Prussia and Bavaria have been transferred to the commission. The commission maintains in force the laws and regulations passed previous to the Armistice, with the exception of special war measures. It has the power to modify them if necessary; collects taxes; administers justice; directs the administration of the country, and can create new administrative organs. It is responsible for public order; the safety of the inhabitants of the district, and their representation abroad; it manages the railways and looks after all public property. These powers, for the use of which the commission is responsible to the League of Nations, are subject to several restrictions. First of all, they cannot affect the rights of the French State in its capacity as owner of the mines, and no restriction can be placed upon the circulation of French money. On the other hand, the country maintains its local assemblies, its religious freedom and its tongue. No fresh taxation (Customs excepted) can be levied without consultation with elected representatives of the inhabitants. Men and women over 20 years of age have the right to vote for the local assemblies.

The Treaty in no way affects the existing nationality of the inhabitants. It stipulates that the governing commission shall be the last judge of any dispute arising from the interpretation of the Treaty itself. The régime thus formed does not establish a state of the Saar, similar to that of Luxemburg, since no new nationality is formed, and since the League of Nations is only acting as trustee. It is none the less true that the Saar territory constitutes a political and economic entity entirely independent and entirely separated from Germany and France. The Peace Treaty did not intend to prolong this state of affairs indefinitely without giving the inhabitants of the Saar an opportunity of expressing and obtaining the fulfilment of their wishes in the matter. Therefore, 15 years after the coming into force of the Treaty, that is to say, in the course of the year 1935, the future régime of the Saar was to be settled by a plebiscite.

**The Plebiscite.**—The details of this plebiscite were to be settled by the League of Nations. All persons over 20 years of age who were resident in the territory on June 28 1919 were to have the right to vote. Three alternatives were to be submitted to the population. First, the permanent maintenance of the system of government provided for in the Treaty—that is to say, autonomous government under the aegis of the League of Nations; second, reunion with France; third, reunion with Germany. Voting was to be taken by commune or by district, and it would therefore be possible to take into account the various votes of different portions of the territory. The League of Nations was to fix the new frontiers, if any, in accordance with the results of the plebiscite. The fate of the mines ceded to France would be decided by the plebiscite also. If the Peace Treaty régime were continued, or if the voting went for reunion with France, there would be no further difficulty; but if all or part of the coal-fields returned to Germany, Germany would have to buy out the interests of the French State in the fields which Germany would then recoup. The price was to be fixed by experts and to be payable in gold.

**Physical Features.**—The river Saar comes into contact with the territory at Sarreguemines, and forms the French frontier to a point just above Saarbrück. It then flows through the territory to a point just downstream from Mettlach. The valley, which, between Saarbrück and Merzich, is fairly wide, runs through picturesque hills covered for the larger part with forests, the working of which is a

valuable industry. Agriculture plays but a very secondary part, and it is upon industry that the population is mainly dependent. The pop. amounts to 703,000, which, on an area of 1,900 sq. km., shows a density of 370 persons per sq. km. The population is very unevenly distributed. It is very dense in the industrial regions, in the valley around mineheads, and wherever factories have been built. It is sparse in the farm and forest lands. The chief towns are Saarbrück (110,000), Voeltingen (19,000), Sarrelouis (16,000), Dillingen (8,000), Merzich (9,000), which are all in the valley itself. Then there are the mining towns elsewhere: Dudweiler (21,000), Sulzbach (23,000), Friedrichsthal (14,000), and the industrial town of Neuenkirchen (35,000). The chief towns in the Bavarian portion of the territory are St. Ingbert (19,000), Homburg and Blieskastel. The chief industry, and the only one mentioned in the Peace Treaty, is the extraction of coal. The mines being worked in 1921 are situated in a district bounded on the one side by the Saar Valley from Burbach to Fraulautern, and by two lines drawn from Waldmohr (N.E. of Neuenkirchen) to Burbach and Fraulautern. Mines are most closely clustered in the little valleys between Saarbrück and Neuenkirchen, and before the war all of them, with the exception of those at Hostenbach and Frankenholz, belonged to Prussia or Bavaria. The total production of the basin averaged 12,000,000 tons a year. It exceeded 13,000,000 tons in 1913, and, in the opinion of experts, a very considerable increase in output ought to be obtained without much difficulty. All the mines are worked for France, with the exception of that of Frankenholz, which was left in the hands of the company which previously owned it. Output fell off during the war, as the result of fewer working hours and less productive labour. In 1920 about 9,500,000 tons were produced, and in 1921 the output would have been bigger had it not been for the general economic crisis. The mines employ over 70,000 persons, and, taking into account their dependents, it may be safely said that about a third of the total population of the country relies upon the mines for its living. The output is consumed, to the extent of about 50%, locally. The rest is exported to Alsace-Lorraine, France and Southern Germany. The export market varies in accordance with the general economic situation. The coal is not very satisfactory for the purposes of steel manufacture, and has to be mixed with coal from the Ruhr before it produces good coke. On the other hand, it is very suitable for heating and the manufacture of lighting gas, and therefore finds a ready sale to railways and municipal authorities. Metallurgical industry is highly developed, and there are no less than 31 blast-furnaces and many steel plants. The factories, which are run by powerful companies, are situated at Burbach, Brebach, Voeltingen, Dillingen, Neuenkirchen and St. Ingbert. The steel output in 1912 was over 2,000,000 tons. Since the Armistice French capital has been largely invested in the metal industries of the Saar and metal workers and miners receive their wages in francs. There are a number of works producing machines and machine tools, so that after coal the iron and steel trades rank as second in importance. Glass and ceramic industries, the former at Sulzbach and St. Ingbert, and the latter at Mettlach and Merzich, are the next important employers of labour. There are over 120,000 persons, counting 70,000 miners, industrially employed. The majority of the workmen are natives of the country, and labour therefore has a stability not often to be found.

**Communications.**—A good system of communications provides an outlet for these industrial products. Saarbrück is at the junction of the Metz-Mayence and Strassburg-Trèves-Cologne line, and is also on a direct line towards Ludwigshafen and the Rhine, as well as in connexion with a number of minor or local railways. There is also a canal through the Saar, which has been canalized upstream from Sarrelouis in order to meet the mine canal and the Marne-Rhine canal in Lorraine. There is no waterway towards the Moselle.

**General Considerations.**—It will be seen that the population is almost entirely industrial. In the towns there are wholesale and retail dealers, and the works and factories are owned by big limited companies. There is therefore but a small middle class and a backward intellectual and artistic development. From a religious point of view Catholics are in a considerable majority, although there is a fairly strong group of Protestants at Saarbrück. Since the German revolution the Socialists and Catholic Centre have been practically numerically equal; and trades unions are either Christian or Red. It is economic questions, output and wages which chiefly concern people. In 1921 there were a number of problems to which no definite solution had been found. There were the change of the Customs frontier, the coexistence in the Saar of the French franc (with its higher and more stable rate of exchange) and the German mark, and the natural increase of economic relations with France. The great resources of the country, however, enabled one to hope that the Saar would be able to adapt itself to these new conditions. The stipulations of the Treaty of Peace, in placing the territory under the authority of a government independent both of France and of Germany, were peculiarly calculated to assist the economic development of the region. They gave to the Saar the means of protecting its own interests, and at the same time spared it the burdens and worries which are the common fate of all great states. (P. DE T.)

**SABINE, WALLACE CLEMENT WARE** (1868-1910), American educator, was born at Richwood, O., June 13 1868. He graduated

from Ohio State University in 1886 at the age of 18 and after two years' further study at Harvard received the degree of A.M. In 1889 he was made assistant in physics at Harvard and the following year instructor. After passing through the usual stages of promotion he was appointed professor of mathematics and natural philosophy in 1905 and the following year assumed the deanship of the newly organized Graduate School of Applied Science. He was an inspiring teacher but his publications were confined to papers contributed to scientific journals. In 1916 he went to France as exchange professor at the Sorbonne but devoted most of his time to removing French tuberculous patients to Switzerland under the auspices of the Rockefeller Foundation. In 1917, however, he lectured on architectural acoustics, a subject of which he had made a special study. He himself fell a victim to tuberculosis and died in Cambridge, Mass., Jan. 10 1919.

**SAGE, MRS. RUSSELL** [MARGARET OLIVIA SLOCUM] (1828-1918), American philanthropist, was born at Syracuse, N.Y., Sept. 8 1828, being descended on her father's side from Capt. Miles Standish. After graduating in 1847 from the Troy (N.Y.) Female Seminary, afterwards known as the Emma Willard School, she taught, first in Philadelphia, and later in Syracuse and Troy until 1869 when she became the second wife of Russell Sage (*see* 23.1002). She proved herself a shrewd business woman and for several years before his death had full control of his affairs. She had long been interested in charities, and in estimating the services of Sage himself it should be remembered that he left to her without restriction his entire fortune, over \$64,000,000, doubtless foreseeing its probable final distribution to charity. In 1907 the Russell Sage Foundation was incorporated under the laws of the state of New York, for the "improvement of social and living conditions of the United States of America," and to it she gave \$10,000,000. The Foundation made many surveys of social and educational conditions in various states and issued many publications dealing especially with housing improvement and reform. In 1912 Mrs. Sage bought Marsh L., off the Louisiana coast, containing about 79,000 ac., later turned over to the state as a permanent refuge for birds. She died in New York City Nov. 4 1918. Her will provided that after enumerated bequests to relatives and friends amounting to about \$12,000,000, the residue, some \$36,000,000, should be divided into 52 parts and variously distributed to many colleges, museums, hospitals, charitable institutions, Bible societies and missions. To most of these she had made gifts during her lifetime. The largest portion, seven parts, was left to the Russell Sage Foundation. It was estimated that during her life she had made public gifts of some \$40,000,000.

**SAID, HALIM, PRINCE** (1859-1921), Turkish statesman, was born at Cairo in 1859, a nephew of the Khedive Ismail. He was a keen politician, and became the official head of the Young Turk party, which carried out the revolution of 1908. He was called upon by Sultan Mahommed V. to form a Cabinet in 1911, and remained at the head of affairs until July 1912. After the murder of Shekhet Pasha in June 1913 he became grand vizier and Minister for Foreign Affairs, and during his tenure of power was a strong supporter of German influence in Turkey. He resigned in Feb. 1917. He was murdered in Rome Dec. 6 1921.

**SAID PASHA** (c.1830-1914), Turkish statesman (*see* 23.1008\*), again became chief minister in the autumn of 1911, and in Dec. proposed to restore to the Sultan the power of dissolving the Chamber without the assent of the Senate. This proceeding gave rise to many storms, and Said Pasha reconstructed his Cabinet Jan. 22 1912. On Jan. 21 he published in the London *Daily Telegraph* the proposed reform programme of his Ministry. He was forced to resign July 17 1912 owing to the strength of the revolutionary movement in the army. He died in 1914.

**ST. ALDWYN, MICHAEL EDWARD HICKS BEACH, 1ST EARL** (1837-1916), English statesman (*see* 23.1013), was created an earl in 1915. He died in London April 30 1916.

**ST. JOHN, FLORENCE** (1854-1912), English actress, whose maiden name was Greig, was born at Tavistock, Devon, March 8 1854. She was three times married, first to Mr. St. John, R.N., secondly to Lithgow James, and lastly to C. D. Marius, both on the stage. Her first appearance was in 1868, and she subsequently

\* These figures indicate the volume and page number of the previous article.

played in a very large number of light operas, winning special success as Germaine in *Les Cloches de Corneville* and in *Madame Favart*. In 1902 she abandoned opera for drama, playing Nell Gwynne in *English Nell* and other comedy parts. She retired in 1910 and died in London Jan. 30 1912.

**ST. LOUIS** (see 24.24).—The pop. of St. Louis in 1920 was 772,897, an increase of 85,868 since 1910, or 12.5%. In the preceding decade the increase was 111,791 or 19.4%. The area remained as fixed in 1876, but the increasing pop. and industries have spread beyond these limits. The city, the counties of St. Louis and St. Charles in Missouri and the counties of St. Clair and Madison in Illinois are grouped as the St. Louis district and treated as a whole in the U.S. industrial census. In 1920 the district contained 1,145,443 inhabitants.

**Municipal Government and Activities.**—A new charter adopted in 1914 reduced the elective officers to mayor, comptroller, president and board of aldermen, collector, treasurer, recorder of deeds, sheriff and coroner, with terms of four years. The legislative branch is unicameral. Each of the 28 wards has a resident alderman elected by the entire city vote, one-half of the board retiring biennially. Mayor, comptroller and president of the board of aldermen form a board of estimate and apportionment. An appointive board of public service consists of a president and four directors of divisions, public welfare, public safety, public utilities, and streets and sewers. Municipal departments and bureaus are grouped in the four divisions. The president of the board has charge of public work and improvements. In 1919 the city's outstanding bonds amounted to \$19,884,000, to which in 1920 was added \$5,500,000 for removal of railway grade crossings, for a municipal farm to afford better treatment of the tubercular and insane, for new engine houses and reconstruction of streets and for municipal lighting equipment. The tax rate for 1920-1 was \$2.55 per \$100 assessed valuation, divided as follows: state purposes, \$0.18; public schools, \$0.78; municipal government, \$1.51; public library, \$0.04; art museum, \$0.02; zoological park, \$0.02. The assessed valuation of realty and personality for 1920-1 was \$777,500,000. City planning was undertaken in 1912 with a commission of nine citizens and five *ex-officio* members. The work done includes a concrete dock, mechanically equipped to convey freight between river and railways. A zoning law determines definitely the residential, industrial and commercial districts; 29 street widenings, openings and cut-offs were under construction in 1921. Neighbourhood parks, playgrounds and squares were increased to 80, embracing 2,908 acres. A pageant and masque given by 2,000 participants before audiences of 100,000 led to the construction in 1917 of a municipal theatre in Forest Park, with accommodation for 9,270. At a cost of \$7,200,000, the city completed in 1917 a municipal bridge of massive steel construction, double track and double deck, across the Mississippi. About five years earlier the McKinley bridge was erected by the Illinois Traction Co., primarily to admit interurban electric trains. Kingshighway viaduct, 855 ft. long, completed in 1912 at a cost of \$500,000, crosses the railway tracks and unites western sections of the city. A municipal court building, a city jail and a children's detention house, all of stone, were erected, the first in 1912, the others in succeeding years, at a cost of \$1,855,000.

**Charities and Education.**—At a cost of \$5,000,000 a new medical school, hospital and children's hospital, occupying several city blocks fronting on Forest Park, have been completed since 1911. The hospital, opened in 1914, represents an investment of \$2,000,000, the sum left 50 years ago by Robert A. Barnes, a banker whose name the institution bears. The medical school, a department of Washington University, includes laboratory, anatomical, clinical and other buildings. In 1914 James Campbell left an estate, valued at \$10,000,000, in trust to St. Louis University (subject to the life income of certain surviving relatives) for the erection and support of a hospital and for the advancement of medicine and surgery. From the surplus of the Louisiana Purchase Exposition was constructed in 1914 the Jefferson Memorial costing \$485,000 and devoted to the collections of the Missouri Historical Society. On new public school buildings, and expansions of old, St. Louis expended during 1910-20, \$3,177,000.

**Finance.**—In 1920 the assets of the banks and trust companies of St. Louis were \$637,615,811.45, and bank clearings were \$8,294,027,135; in 1910 the latter were \$3,727,949,379. The First National Bank, with total resources of \$155,953,137, was formed in 1919 by a consolidation of three existing banks.

**Commerce and Industry.**—According to the records of the Merchants' Exchange and the Chamber of Commerce, 35 lines of industry in the St. Louis district did a business in 1920 of \$1,582,957,145. Some of the largest items of wholesale trade in 1920 were dry goods, \$240,000,000; carpets, rugs and linoleums, also \$240,000,000; boots and shoes, \$175,000,000; groceries, \$175,000,000; railway supplies, \$210,000,000; hardware, \$115,000,000; foundry products, \$125,000,000. St. Louis receives 70,000 H.P. by a 110,000-volt transmission line from the Keokuk dam in the Mississippi at Keokuk, Ia. Motor licenses issued in 1914-5 numbered 9,867, and 45,499 in 1919-20. The position of St. Louis as the largest horse and mule

market in the world was maintained, the volume of business in 1919 being \$50,000,000. The city continued to be the largest primary fur market of the world, with sales of \$27,200,000 in 1920. Sales of meat products in 1919 were \$128,000,000; hog receipts, 3,659,534; head cattle receipts, 1,500,000. The foreign trade of St. Louis was \$100,000,000 in 1920, an increase of \$25,000,000 over 1919. The total tonnage shipped out of St. Louis in 1920 in domestic and export, was 29,036,405 (by rail) and 166,140 (by water); tonnage received in the same year was 43,104,519 (by rail) and 177,925 (by water).

The more important new buildings of the period 1910-20 with the amounts they cost were: the Statler hotel, \$3,000,000; the Warwick hotel, \$400,000; the cathedral of St. Louis, \$2,000,000; the Missouri athletic club, \$500,000; the Railway Exchange, \$3,000,000, 18 storeys, covering an entire city block; the University club, \$600,000; the Young Women's Christian Association, \$500,000; the Boatmen's bank, \$750,000; the Arcade, \$1,250,000; the Post-Despatch building, \$500,000; the Bevo Manufacturing Company, \$1,000,000. The cost of new buildings in 1919 was \$20,538,450.

The *St. Louis Republic*, a morning newspaper founded in 1808, was purchased in 1919 by the *St. Louis Globe-Democrat* (a Republican paper), and discontinued. This left two morning newspapers, the *Globe-Democrat*, and the *Westliche Post* (German). There was a marked increase in the circulation of the evening papers.

When the Armistice was signed Nov. 11 1918 one in 13 of the city's pop.—56,944—was in the army, navy or marine corps. The total casualties were 2,511, of which 1,384 were killed in battle. Of the three Liberty Loans, St. Louis took the equivalent of 25% of the assessed value of the city's realty and personality. On the third, fourth and fifth calls for loans the St. Louis Federal Reserve district was the first to subscribe its quota. On the third loan the city subscribed \$65 for every man, woman and child, nearly three times the quota. (W. B. St.)

**ST. MIHIEL, BATTLE OF:** see WOEVRE, BATTLES IN THE, section 2.

**ST. PIERRE and MIQUELON** (see 24.41).—During the early years of the decade 1910-20 this little French colony suffered severely as a result of unprofitable fisheries, and large numbers of its people emigrated to Nova Scotia and Quebec. After the World War began in 1914 the French draft law called all the male inhabitants of conscript age to France where they took part in various services. As their withdrawal crippled the fisheries, which could not be prosecuted by the older people and the women and children, the survivors were returned as speedily as possible and ordinary operations were resumed. But during the decade, also, the use of the steam trawlers in the fisheries was on the increase, displacing the wooden sailing vessels previously employed, and this also lessened the number of those finding steady employment. However, during the later years of the war, with fish increasing in value, the colony became very prosperous, and after the Armistice the French Government decided to build a large refrigerating plant, costing about £1,000,000 at St. Pierre for the treatment of cod and other fishes. The financial success of this project was doubted by many, but this deep-sea fishery was being supported by France as a training school of men for its navy, and for the same reason generous bounties are given on all the fish caught. The pop. was in 1920 about 4,500, but the prosperity of the little community was impaired by the difficulties of exchange.

**SAINT-SAËNS, CHARLES CAMILLE** (1835-1921), French musical composer (see 24.44), died at Algiers Dec. 16 1921.

**SAINTSBURY, GEORGE EDWARD BATEMAN** (1845- ), English man of letters (see 24.45), published subsequently to 1910 a *History of English Prose Rhythm* (1912); *The English Novel* (1913); *A First Book of English Literature* (1914); *The Peace of the Augustans* (1916); *A History of the French Novel* (2 vols., 1917-9) and *Notes on a Cellarbook* (1920).

**SAIONJI, KIMMOCHI, PRINCE** (1830- ), Japanese statesman, was born in Kyoto, in 1839. When less than 20 years of age, he took part in the councils which led to the Restoration and at 19 was commander-in-chief of an imperial army. He studied in France from 1869 to 1880 and returned home imbued with democratic ideas. In 1881 he commenced his official career and in the following year accompanied Mr. (afterwards Prince) Ito to Europe and the United States to investigate the parliamentary system. In 1885 he was appointed minister to Austria; in 1888 he occupied a similar post in Berlin and in 1891 was appointed president of the Board of Decoration. In 1893, he became vice-

president of the House of Peers and was raised to the Privy Council in 1894. In the same year he received the portfolio of education in the second Ito Cabinet, temporarily acting as Minister of Foreign Affairs during the illness of the late Count Mutsu. He was again Minister for Education in the third Ito Cabinet from Jan. to June 1898, and was nominated president of the Privy Council on the death of Count Kuroda, three times acting as prime minister during the interval between the resignation of one Cabinet and the formation of the succeeding one. In July 1903, he became the leader of the Seiyu-Kai and in 1905 formed his first Cabinet as prime minister; he was again premier in 1911 to 1912. In 1919 he represented Japan as chief envoy at the Peace Conference and was invested with the Grand Order of Merit. He was made a prince in 1920 in recognition of his services in connexion with the World War and the Peace Conference.

**SAKHALIN** (see 24.54).—The Japanese portion of the island of Sakhalin, to the S. of the parallel of 50° N. lat., known officially as Karafuto, was ceded to Japan under the treaty of peace with Russia in Oct. 1905. The area is about 13,148 sq. m. and the pop. in 1920 was 105,765. The taxes and other sources of revenue from the island, with the addition of a grant of about 700,000 yen from the national treasury, are sufficient to cover the administration, the budget balancing at about 10,000,000 yen.

The chief industry of the island, and one of the oldest, is that of the fisheries, and these are being successfully developed. The most important is the herring fishery, followed by trout and salmon, these all being relegated to specially controlled areas; cod and crab are also plentiful, the latter being canned and exported chiefly to America.

About 17,000 ac. of land were under cultivation in 1918, the chief crops raised being oats, barley, potatoes, peas and buckwheat. More than 900,000 ac., suitable for cultivation and pasturage, are still available and many settlers are engaged in agriculture, the climate and soil rendering this a profitable undertaking. There are over 8,000,000 ac. of practically untouched forest, chiefly conifer, on the island, providing in the future an almost inexhaustible supply for the manufacture of pulp for paper-making. In consequence, five pulp manufactories have already been established, each producing over 10,000 tons per annum, and five more are projected.

There are three important coal-fields in the island, producing about 136,000 tons annually. Alluvial gold is found in the river beds, iron pyrites exist in large quantities in the Notoro peninsula, and in 1907 and 1913 oil-bearing strata were discovered on the W. coast in large areas at Anshi and Notasamu. (H. S.)

**SALANDRA, ANTONIO** (1853– ), Italian statesman, was born at Troia in 1853. He first entered parliament as member for Lucera and from the beginning of his political career he sympathized with the views of Baron Sonnino. When the latter became Treasury Minister in the Crispi Cabinet of 1893, Salandra was chosen under-secretary in that department. He was Minister of Finance in the first Sonnino Cabinet of 1906 and Treasury Minister in the second (1909–10). When in March 1914 Sig. Giolitti resigned, Sig. Salandra was called upon to form the new Cabinet, and he was Premier when the World War broke out in Aug. following. On the death of the Marquis di San Giuliano in Oct. he offered the Foreign Office to his former chief, Baron Sonnino, who accepted it. It was the Salandra Cabinet which took the momentous decision of bringing Italy into the World War on the side of the Allies, and it conducted the Government of the country during the first months of the campaign more successfully than any of the succeeding war Cabinets. On resigning office in June 1916, he continued to support both the Boselli and the Orlando Cabinets. As professor of Constitutional Law in the university of Naples he published several important works on legal subjects, and translated Spencer's *Principles of Sociology*.

**SALISBURY, JAMES EDWARD HUBERT GASCOYNE-CECIL**, 4TH MARQUESS OF (1861– ), English politician, eldest son of the 3rd marquess (see 24.76), was educated at Eton and University College; Oxford, where he took a second-class in History in 1884. The next year he entered Parliament as member for Darwen. He was defeated in 1892, but he returned as member for Rochester in 1893 and remained in the House of Commons till he succeeded his father in 1903. He fought in the S. African War with the 4th battalion of the Bedfordshire regiment, and was mentioned in despatches. On his return in 1900 he became Under-Secretary for Foreign Affairs, a post which on succeeding to the peerage he

quitted for that of Privy Seal in the Cabinet of his cousin, Mr. Arthur Balfour; and he held, for some months in 1905, the office of President of the Board of Trade. Lord Salisbury never loomed large in the House of Commons, though he was for some years chairman of the Church Parliamentary Committee, and discharged competently his duties as Foreign Under-Secretary. But he gradually came to occupy a position of increased authority in the Upper House. He threw in his lot in 1911 with the "Die-hards," and spoke in favour of defeating the Parliament bill and daring the Government to create sufficient peers to carry it. During the early years of the war he was energetic in the discharge of his military duties as lieutenant-colonel of his yeomanry regiment. He did not join either Coalition Government, but was critical of both, taking an independent line. As the war drew to a close he gradually came to assume the informal leadership of a Conservative and Unionist Opposition in his House, showing himself particularly sensitive to departures from the old policy of his party on Irish and ecclesiastical questions. He married in 1887 Lady Cicely Alice Gore, daughter of the 5th Earl of Arran, and had two sons and two daughters. He was created K.G. in 1917.

**SALONIKA CAMPAIGNS**, 1915–1918.—Under the heading of **SERBIAN CAMPAIGNS** the conquest of Serbia in 1915 by Austro-Hungarian forces is narrated. The idea of reinforcing the Serbian front with Allied forces had been contemplated both in England and in France some time before it was carried out. British and French guns, in charge of naval missions, had taken some part in the campaign of 1914, and stores had been sent up from Salonika at intervals. In the winter of 1914–5 Lord Kitchener several times considered the advisability of sending a number of the British Army Divisions into Serbia *via* Salonika. On the part of the French, M. Briand, it is said, proposed later in 1914 to make a serious military effort in the Balkans. But the Dardanelles campaign diverted attention from this project, and it was not till in August 1915, when the failure of the Dardanelles offensive was evident, that the creation of an Anglo-French army on the Balkan front was seriously undertaken. General Sarraill, whose military reputation stood very high in France, had been suddenly deprived of his command of the III. Army by Joffre, ostensibly owing to an unsuccessful combat at Boureuilles in Argonne, but really as the result of long-continued friction between the two. Sarraill, however, stood in close relations with the political leaders of the Left, and the autocratic methods of Joffre's G.Q.G. had already raised considerable opposition in the Government and the Chamber; it suited the Government, therefore, to satisfy the Left, to snub the G.Q.G., and to remove to a distance a forceful and ambitious personality, by sending Sarraill to the Mediterranean as commander of an army yet to be created.

Appointed on Aug. 5, Sarraill was ordered to study the military situation and submit proposals. In his written projects he came to the conclusion that it was impossible to abandon ground in the Gallipoli peninsula, and had asked for both his own and the British contingents to be made up entirely from forces in France or in England. An inter-Allied conference, held at Calais early in September, had agreed to this, but with the reservation that no forces were to go till after the forthcoming Champagne and Artois offensives had taken place. But the news of the Bulgarian mobilization drove home at last the urgency of the crisis. Orders went to the Dardanelles on Sept. 26 for two British Divisions—in the sequel one—to go thence to Salonika; the French "Expeditionary Corps" was likewise to send a Division, and the Greek authorities had agreed to permit the landing. Sarraill himself was to bring a mixed brigade from France, as an earnest of the forces promised later.

On Oct. 3 advanced parties of the French landed at Salonika without difficulty, only a formal protest being made by the authorities on the spot. Next day M. Venizelos in a speech at Athens declared that Greece would come to the aid of her ally Serbia against any attack by Bulgaria, and at once a crisis arose at Athens. On the 5th King Constantine informed Venizelos that the policy indicated had not his support, and the Government fell, to give place to the neutralist Zaimis cabinet.

During the first few days instructions from Paris to Bailloud (commanding on the spot pending Sarraïl's arrival) varied several times, apparently in accordance with political nuances. At first (Oct. 3) the word was to concentrate at Nish, in the heart of Serbia; next, the Greek frontier was not to be crossed (Oct. 10); and then again (Oct. 12) authority was given to take over protection of the railway between Demir Kapu defile and the Greek frontier against possible attack from Strumitsa in Bulgaria, thereby releasing a small Serbian force to rejoin its own army. Meantime the Serbians demanded more direct assistance, but Sarraïl (who arrived on the 12th), taking into account the size of his force—only 1½ divisions plus the British 10th Div. which was not under his orders—and the fact that it could only disembark and push on by dribbles, determined to limit his advance to the near side of Demir Kapu. On Oct. 14 the leading French troops arrived at Strumitsa station (in Serbia) in time to aid the Serbian railway guards in repelling an inroad from Strumitsa.

In Sarraïl's opinion the only service he could render was to concentrate on the routes to Strumitsa, and, by an offensive into Bulgarian territory, to draw off as many Bulgarian forces as possible from the main attack further north. General Mahon, commanding the British 10th Div., took the same view,<sup>1</sup> and formed a mixed force which began to move up to Doiran, on the right rear of the French group in the Rabrovo region. On the 17th, however, in answer to a request from the Serbian commander at Uskub, Sarraïl began to push a brigade beyond the Demir Kapu defile to Krivolak, but he refused to advance it to Veles, though again pressed to do so by the Serbs, and in fact a sharp attack developed from Strumitsa on Rabrovo on the 21st and 22nd, which, till it was repulsed, threatened to isolate all French detachments N. of Strumitsa station. Meanwhile, Paris sent further instructions to the effect that all possible help should be afforded to the Serbs, subject to the limitation that the French communications with Salonika were in no case to be compromised. In reality, the French and British Governments were very uneasy about the attitude of the Greek Army, a considerable force of which lay in the region N.E. of Salonika. The fall of Venizelos had put an end to the prospect of Greek coöperation, and under the new régime the local military and civil authorities began to oppose every move of the Allies, which was not entirely covered by Serbia's treaty rights, to the use of Salonika and the railway. Thus, when Mahon's force moved forward the use of the Salonika-Kilkish (Kukush)-Doiran line was refused, and it had to use the main line, detain in the midst of the French, and work thence outwards towards its post at Doiran.

On Nov. 1 the 122nd French Div. began to arrive from France, and Sarraïl had already prepared to attack from Rabrovo towards Strumitsa with Bailloud's 156th Div., with Mahon in echelon behind his right, while his forces about Krivolak and Kavadar (51st Div.) made ready to attack in flank any Bulgarian force which should advance up the Cerna (Tserna) in pursuit of the Serbians. On Nov. 3 an attack was accordingly delivered northward from a front E. of Rabrovo; weather and the difficulty of the country brought it, however, to a standstill on the 6th, though local advances were made later. At this moment (Nov. 4) Galliéri, having become War Minister in the new French cabinet, telegraphed orders for the French Army to operate towards Veles, adding that four more British divisions were to be sent, which on arrival would take over the front leftwards from Doiran. The British 22nd Div. was in fact already close to Salonika, with another under orders to follow. But Sarraïl judged that it was impossible to wait for these reinforcements. Todorov's Bulgarian Army had already thrust itself between the Serbian Main Army and Krivolak, and the

urgent thing was to relieve pressure on that part of the Serbian forces which was retiring by the Babuna pass on Prilep, while reserving the possibility of action towards Veles if the Serbian Main Army should after all seek to break through towards its Allies. Orders were therefore given to the Krivolak-Kavadar force (57th Div. to be reinforced by the 122nd Div.) to take the offensive westward over the Cerna, so as to strike the pursuers in flank or rear. On the 6th-9th accordingly the 57th Div. crossed the Cerna and pushed an advance into the mountains towards the Babuna, still held by the Serbs. But the Bulgarians were in force, and the French retired to their Cerna bridgeheads, which the Bulgarians attacked without success on the 12th, 13th, 14th and 15th.

During these and the following days instructions came repeatedly from Paris to modify the French commander's views and dispositions, now laying emphasis upon coöperation with the Serbs, now upon dangers from the Greek Army in rear. Finally on Nov. 21 Sarraïl was given a free hand to decide what aid he could give to the Serbians and at what moment he should retire on Salonika. He adopted at first a middle course. He wished neither to attack at the risk of involving two-thirds of his forces in the Serbian *débâcle* (the Babuna had been turned by the N. on Nov. 14), nor to fall back to Salonika, where prestige counted for so much, but to hold on in the entrenched camp of Kavadar in the hope of "something turning up." On the 21st-22nd, however, the retirement of the 122nd Div. over the Cerna under some pressure, together with the general military situation and a definitive refusal of reinforcements from France,<sup>2</sup> decided him in favour of falling back to Salonika, a decision approved by Galliéri. Four days later Sarraïl was officially informed that the Serbians were retreating in the Adriatic direction. The preparations for the Vardar retirement had already begun on the 24th with the seizure of a position on the E. bank, to prevent interference with the retreat of the Krivolak-Kavadar force on Demir Kapu. On Dec. 1 only rear-guards remained at Krivolak. By the night of the 3rd-4th all troops were inside Demir Kapu, and on the 6th this position also was given up. On the 8th the Bulgarians, who had from time to time attacked the rear-guards on the Vardar and the positions near Kosturino on the Strumitsa route, delivered a more concerted attack on the front Ormanli (now held by the British)-Kosturino-Gradets on the E. and Mirovcha Petrovo on the W. of the Vardar. Their evident intention was envelopment, and on the 9th, judging the centre of his line to be too pronounced a salient, Sarraïl took up a position along the Petrovska stream, W. of the Vardar and the heights of Dedeli E. of it, the village of Dedeli being held by Mahon's forces, which from that point were echeloned back to Lake Doiran. From this position also the Allies retired under threat of envelopment during the night 11-12, after holding their ground against attacks on the 11th. Lastly, the French 122nd and 57th Divs., at Gyevgyeli (Gevgeli) and near Doiran, covered the evacuation of part of Mahon's force on to the Salonika railway and the reconstitution of the 156th French Div., which had been considerably split up.

Thus the drive into Serbia came to an end, with little material loss, but a sad diminution of prestige, and the forces fell back to the following positions about Salonika: advanced guards of 120th French Div. Karasuli with a detachment at Gumenye, and of 57th French Div. with cavalry, Kilkish, with a detachment at Kilindir; main body (122nd, 156th, 57th) in position on the line Doganyi-Daudi. British 10th and 22nd Divs. Salonika, with other British forces arriving. Important points on the railway had been destroyed during the retreat. Meanwhile, on Dec. 4,

<sup>1</sup> According to Sarraïl, the British Government instructed Mahon that his troops were to remain at Salonika, and it was on his own initiative that the British general formed a mobile force. Further instructions authorized Mahon to move forward but forbade him to cross the Greek frontier, until on Oct. 27 a final telegram removed this restriction.

<sup>2</sup> At that moment, according to Falkenhayn, the combatant strength of the Allies in France was to that of the Germans in the ratio of rather more than 3 to 2. Sarraïl says that in his interview with Lord Kitchener on Nov. 17, the latter informed him that Joffre had declared that he would not give him (Sarraïl) another man, and that the British would furnish five divisions instead. In accordance with this promise, besides the 10th and 22nd Divs., the 27th and 28th Divs. from France landed at Salonika in the last days of Nov. and first days of Dec., and the 26th Div. also from France, early in Jan. 1916.

the Serbs had evacuated Monastir in their now frankly westward retirement.

The reassembly of the Allied Salonika forces around their port of origin naturally raised the question—were they to remain there? Their *locus standi* had been the fact that they were Allies of Serbia using a line of communications to which Serbia was by treaty entitled. This part of the case no longer existed, Serbia being wholly in the hands of the enemy, and could only be revived if and when the Serbian Army were transferred from the Adriatic ports on which it had retreated to Salonika. Another part of the justification for the Allies' presence was the admitted fact that they had come at the request of Venizelos, and for the purposes of common action with the Greeks, but since Venizelos's fall even the Zaimis cabinet, representing "benevolent" neutrality, had given way to a cabinet representing at least strict neutrality,<sup>1</sup> which gave the Germanophil element at Salonika all the official justification it needed to pursue the policy of obstruction that it had already initiated in the Zaimis period. On the other hand the factor of prestige was one of great weight, especially in view of the pending abandonment of the Dardanelles campaign, and although Sarraill suggested that evacuation followed by a dramatic offensive at some other point would more than restore the lost prestige, it was decided that Salonika should be held. Beyond that decision, however, no clear military or political intention was at that time formed. The policies of the British, French and Russian Governments were, in unison as to the problem of Greece, and it seems to have been thought that, by remaining, the Salonika force would confront the enemy with as difficult a diplomatic problem as its own. This was, indeed, the case. The policy to be followed by the Central Powers, both towards Greece and in occupied Serbia and Albania, was wholly unsettled. "While the troops of the two Imperial Armies were hastening from victory to victory," says General von Cramon, the German military commissioner at Austrian headquarters, "behind the scenes, at the two general headquarters, the clouds were gathering of that conflict which in the end brought about the reverses of 1916." Although on Nov. 6 it had been agreed that operations were to be pushed with all energy towards Salonika, Falkenhayn almost immediately began to check the further south-westward advance of German troops, and though Conrad succeeded in bringing the German command to renewed coöperation, this was obviously to be limited to a minimum, both on account of supply difficulties in the Balkans and of the pressing requirements of the two main theatres—in particular those of the forthcoming attack on Verdun, of which only a few men in the German headquarters and none in the Austrian had the secret. Falkenhayn's view was that the Bulgarians alone should undertake the campaign in southern Serbia. But, whatever the attitude of Greece towards Germany, it was so hostile towards Bulgaria that to cross the frontier in pursuit of Sarraill without a large proportion of German troops being included in the advance was politically impossible. Austria herself was absorbed in Montenegrin-Albanian enterprises, and could give no direct assistance in the advance to Salonika that her general staff advocated. Moreover, Conrad had his secret as well as Falkenhayn—he was planning to carry out his offensive of Asiago, with or without the aid of Germany.

At the end of 1915 therefore, though the Central Powers had succeeded in their purpose—Serbia being conquered and the railway to Constantinople reopened—whereas the Entente had failed, the outlook was no clearer for the former than for the latter. The pursuit was accordingly suspended at the frontier, partly perhaps in the hope that the Entente would itself take the initiative in closing down the operations. If they did not do so Falkenhayn was determined that eventually

<sup>1</sup> The first act of the Skouloudis ministry had been to announce that any of the Allied forces in Serbia which retreated into Greece would be disarmed and interned. A prompt note from the British and French Governments closed this incident, but the indication of policy was unmistakable. About the same time Skouloudis notified the Bulgarian Government that it would not permit the latter's troops to cross the frontier.

the Bulgarians alone should remain on this front. They were, by the terms of the military agreement, unavailable for any other, and if they succeeded in containing even a smaller force of Entente troops that was not so limited, something was gained for nothing. On the other hand this idea implied a defensive position short of the Greek frontier, as a purely Bulgarian advance into Greece was impossible. Thus, at the beginning of 1915, the opposing forces stood roughly 20 m. apart, each limited against its own will to a strict defensive by political conditions and each regarded by its own superior authorities as a "commitment."

At the end of the year two incidents occurred to illustrate the complexities of the Salonika front. On Dec. 30, though Bulgarian and German forces were forbidden to cross the frontier, German aircraft, by order, bombed the city of Salonika itself, where nine out of ten of their possible victims were neutrals and the tenth an agent of their own side. Sarraill promptly retaliated by arresting the German, Austrian and Bulgarian consuls, hitherto left unmolested. Another air raid took place on Feb. 1 1916, to which the Allies replied by bombing the village of Petrich, just within the Bulgarian frontier, but as the village contained Greek and Serbian as well as Bulgarian inhabitants, a complaint was made, and Sarraill received orders not to repeat such raids. A few days before this another incident showed that the personal estrangements of Joffre and Sarraill were still operative. The army of the Orient had been brought under Joffre's command<sup>2</sup> early in December, and Joffre had taken the opportunity to send out Castelnau to report on Sarraill's management of the situation. Castelnau, however, pronounced himself satisfied with what he saw, and only issued a few instructions as to details. Nevertheless, in various ways the friends and the enemies of Sarraill alike busied themselves with accusations and counter-accusations, out of which a regular *affaire* was growing up to complicate an already confused situation. Relations between Sarraill and Mahon on the other hand were excellent, and although each was independent of the other, and the British general was himself under the command of General Sir C. Monro, commander-in-chief in the Mediterranean, no important divergencies of policy developed during the phase of passive defence in the precincts of Salonika.

With the Greeks, naturally, all possible causes of friction existed. Army commanders operating under war conditions are not prone to sacrifice realities to appearances, and what seemed to them plain military common sense was, from the point of view of the Greeks, high-handed conduct to be resisted by all safe means of obstruction. Amongst the major questions at issue were the disarmament of the coast defences of Salonika, the use of the Salonika-Doiran railway for the British contingent, the feeding of the Greek forces E. of Salonika who were dependent for supply upon railways seized by the Allies, and the continuance or non-continuance of the Greek garrison in Salonika city. Minor questions of an administrative character were naturally innumerable. Most of the energy of the staffs in Salonika and the legations at Athens was devoted to finding solutions for conflicts which the equivocal position of the Allies made inevitable.<sup>3</sup> During these conflicts the Salonika lines,

<sup>2</sup> Joffre was *Commandant en Chef* of the "North-Eastern group of Armies," no other formations having been contemplated before the war. On being sent to the E. Sarraill was appointed *Commandant en Chef* also. But, in Dec., Briand placed Sarraill's forces under Joffre's supreme command.

<sup>3</sup> On Jan. 12 1916 the bridge of Demir Hissar on the Struma was blown up by a special force sent out by Sarraill in the presence of the Greek forces stationed there—a high-handed act which could only be excused or justified by the necessity of preventing the Bulgarians and Germans from deploying heavy artillery against the N.E. part of Salonika in case of siege. On Jan. 28 1916 another problem received an enforced solution, after negotiations had failed to find an "elegant" one. Anglo-French forces by a *coup de main* occupied the Greek coast-defence batteries on the Gulf of Salonika. These incidents naturally intensified the hostility of the Greek officers and officials to the Allied occupation, or at least gave them tangible grievances. In particular, the feeding of the Greek forces isolated by the cutting of the Struma railways caused difficulties, and from it, in part at any rate, arose the critical question of demobilizing the Greek Army in the Spring of 1916.

with the aid of civil labour, were made defensible by the first weeks of the new year. The line selected ran from the Vardar mouth, round by Doganzi and Daudli to the neighbourhood of Langaza, whence it passed along the barrier of lakes to the head of the gulf of Orfano—80 m. of frontage for a force of nine divisions.<sup>1</sup> Of this frontage, however, nearly 45 m. was guarded by lake and swamp; and, taking into account the presence of large bodies of Greek troops in the Seres-Rupel region to the right front and in the Vodena-Florina region to the left front, Sarraill considered that danger was practically confined to the central sector between Lake Langaza and the Vardar, in the event the position was ever attacked.

During this period (Jan.-Feb. 1916), the Bulgarians were reinforced by the German XI. Army (von Gallwitz) consisting of the IV. Res. Corps (101st and 103rd Divs.) and the Alpine Corps, and by their own 1st Army, all these forces aligning themselves along the Greek border from Lake Ohrida to the point at which the Struma enters Bulgarian territory. The 1st Bulgarian Army, with flank guards at Dibra and Elbasan in Albania, had two divisions<sup>2</sup> on the front S. of Monastir-Duditsa; the XI. German Army, with 1½ Bulgarian Divisions attached, held the Vardar valley between Duditsa and the Belashitsa Planina, and Todorov's II. Bulgarian Army of three divisions that ranged from Strumitsa to Petrich, with detachments further E. at Nevrekop (Mesta valley). But in March Falkenhayn began to withdraw all the German formations save the 101st Div., which continued in the Balkans and was gradually reduced to a cadre. On his side Sarraill made some slight demonstrations towards Doiran and towards Vodena, but otherwise no move occurred. Early in March 1916, however, in the crisis produced by the attack on Verdun, Joffre telegraphed orders to Sarraill to advance in order to fix the enemy's forces on his front. On the other hand General Mahon, on asking for instructions, was forbidden to move until authorized by the British Government.<sup>3</sup> The relief offensive, therefore, was limited to a skirmishing advance by the French, which began on March 13, and gradually brought the French 51st Div. to the N. of Kilkish, and the 122nd to the N. of Lake Amatovo, the 156th between them (March 31).

During April 1916, while French cavalry moved out W. of the Vardar towards Vodena and the 17th Colonial Div. came up behind the centre, the British in their turn began to move up to Kilkish, authority to participate "in an operation of a demonstrative character" having been given by the War Office about April 10 (Joffre to Sarraill, April 20). Lastly, the Serbian Army, reconstituted and partially reequipped at Corfu, was beginning to land at Salonika, and by June 1 18,000 combatants and non-combatants were present, completing their equipment and organization in the Chalcidic peninsula. These methodical proceedings, however, did not satisfy Joffre, whose instructions to Sarraill from March onwards were to prepare for an offensive in earnest. To Sarraill's demand for reinforcements for such an offensive, the French commander-in-chief replied that the French Army of the E. must prepare to attack at the moment fixed by himself, even without the British. In explanation, he hinted that when that moment came, not only would British objections be removed, and all five British divisions be equipped for mountain warfare (making Sarraill's total force, with the Serbians, 300,000 strong to the enemy's 260,000), but Rumania and Greece would be in the field as his Allies. Thus for the first time since the Serbian retreat the Salonika force was assigned to a positive purpose. It will appear in the sequel how much of reality and how much of illusion was contained in the scheme, which, in sum, was to attack at a date chosen in relation to other theatres and especially Rumania, with Sofia as the objective.

<sup>1</sup> The withdrawal from Helles freed further French troops, from whom a serviceable brigade was made up and combined with a brigade from France to form the 17th Colonial Division.

<sup>2</sup> The Bulgarian division had twice the infantry strength of a German or German division.

<sup>3</sup> Sarraill's orders were issued by G.Q.G. without consultation with the British government or Lord Kitchener. (Sarraill, p. 83.)

Meantime, an important incident had taken place on the Struma frontier. In accordance with their declared policy of standing aside and leaving a "lists" for the combatants, the Greeks had disarmed and evacuated their fort of Dova Tepe, situated on the watershed between the Vardar and Struma basins and commanding a knot of communications. In the course of his gradual advance to the frontier, Sarraill put a detachment into this fort on May 10. But further to the right, outside his reach, lay a still more important fort, that of Rupel defile. This fort was not merely disarmed but actually handed over to the Bulgarians by the local Greek general, with or without authority from Athens (May 26).

Events had moved. Though the German forces (except the cadre of the 101st Div.) had by this time been withdrawn from the Balkan front, the Greeks had apparently overcome their repugnance to a purely Bulgarian inroad, to the extent of actually facilitating it. The Allies' right was, potentially, turned, and if the occurrence were any indication of probabilities of the future, their rear also was endangered. Action was taken promptly by Sarraill. A mobile group of all arms was moved into the Struma region, and with the agreement of Gen. Milne (who in May succeeded Mahon in command of the British) and of the Entente Governments, the Greek authorities at Salonika were deprived of power by the proclamation of a state of siege (June 3). A day or two later London and Paris also acted. An economic blockade of the Greek coast was declared, and on the 18th Sarraill was ordered to send a brigade by sea to Athens. King Constantine accepted the ultimatum of the Allies (June 21), and Zaimis returned to power on the basis of friendly neutrality. A little later the Rupel incident had its last and most important sequel in the Venezelist *coup d'état* of Aug. 30.

Militarily the seizure of Rupel, carried out at the suggestion of Falkenhayn, seems to have had no truly offensive intention. The Central Powers had abandoned the idea of invading Greece once for all about the end of March, and the Bulgarians acted with the idea of guarding their left, and securing connexion with any Turkish forces which might be sent to their aid by the Constantinople-Seres railway, though in view of the situation in Armenia such a reinforcement was unlikely. As for Sarraill, so also for his opponents, the Balkan front was already involved in a larger game.

As has been noted above, the idea of an Allied offensive from Salonika in coöperation with a Rumanian intervention came under discussion as early as mid-April; at that time Joffre seems to have thought that this intervention might come in a few weeks, for he overruled Sarraill's objections to commencing operations in the hot weather, and fixed the month of June for the beginning of the offensive. Under these instructions Sarraill formed his first plan (May 2) which was, in brief, to employ the Serbs on the left wing for the attack of Monastir (frontally and by envelopment), and for pressure on the Cerna bend and the passes further E. towards the Vardar; to place a French division on the Vardar and the railway; to have three British divisions, with a fourth on their right rear, so placed as to execute a demonstrative attack on the strongest part of the enemy's front, viz. Vardar-Doiran; and to attack with three French divisions from Popovo Surlovo-Dova Tepe and Poroy northwards through the Belashitsa Planina, while the French Struma mobile group demonstrated towards the Demir Hisar angle of the Struma, and the fifth British division with cavalry watched the lower Struma front. In case the semi-offensive, semi-demonstrative, operations should develop into a real advance, the Serbs were to take Veles and Ship, the British Radovishita-Strumitsa, and the French Jumaya as their objectives. The armies would thus condense their front as they advanced, the route Monastir-Veles marking the extreme left of the Serbian movement, and that of the upper Struma, famous in the war of 1913, taking the French into positions on the Bulgarian line of retreat. But the negotiations of the Allies with Rumania, and their internal discussions relative to their Salonika operations and their policy in Greece, dragged on. On June 6 Gen. Milne was

informed by the British Government that he was not to engage in offensive operations, and was only to consider himself under Sarraill's orders in respect of the defence of the entrenched camp. He informed Sarraill accordingly, and suggested that the British should take over the Struma front, to which Sarraill agreed. The Serbs were now preparing to take up the front from Vodena to Lyumnitsa, with their centre of gravity on the right, the French held from Lyumnitsa to the Poroy road, and the British to the right of that road from Loznitsa to Orlyak. On the 12th Sarraill was ordered not to take any action that would involve the British in operations unconcerned with the defence of Salonika itself, and to limit himself to threatening the Bulgarians by a deployment close up to the frontier; and on the 14th he was notified that the French Government had agreed to the British proposal to postpone the offensive.

A few days later, on the 25th, he was informed that though the instructions of the 14th held good in general, events might rapidly make it necessary for him to attack, though with a limited objective, and using the French and the Serbians only; and on July 15 he was told that the British Government had agreed that if Rumania intervened all British troops equipped for mountain warfare should participate in Sarraill's offensive, and instructed to prepare to "pin the Bulgarians on the Greek frontier and put them out of action so far as serious operations against Rumania were concerned." Three days later, on July 17, G.Q.G. informed the French commander that the Entente-Rumanian military convention would probably be signed on the basis of (a) an offensive from Salonika on Aug. 1, to cover the final preparations of the Rumanians and their initial operations against Transylvania; (b) a Russo-Rumanian offensive beginning on Aug. 8, and directed against Bulgaria; and finally (c) a combined advance of the Russo-Rumanian Army and the Salonika forces with a view to uniting and crushing the Bulgarian Army in the field. A few days later a formula agreed upon between the various Allies constituted Sarraill commander-in-chief of the French, British, and Serbian Armies, as also of the Italian and Russian contingents.<sup>1</sup> Gen. Cordonnier being appointed to command the *Armée française d'Orient* as a constituent part of the Allied Army.

Sarraill's new plan was to dispose Milne's available forces on the front Dova Tepe (exclusive)—Lake Ardzan (exclusive) or to the Vardar if possible, to reduce Cordonnier's troops E. of Dova Tepe and Milne's on the Struma front<sup>2</sup> to a minimum, and with Cordonnier's Army to attack on the front Vardar-Doiran, while the Serbs from above Vodena made their main attack on Huma and subsidiary advances towards the Cerna bend and possibly Monastir. This plan was approved by Joffre, who added that the British Army would receive instructions from the War Office not to limit itself to defensive or demonstrative action. But these instructions, from Gen. Robertson to Gen. Milne, introduced an important limitation in their general approval. Milne was "not to try to take the enemy's positions until an adequate equipment of heavy artillery and other conditions gave a reasonable expectation of success," and the offensive was "not to be taken till Rumania definitely came into the field," an event of which Sir W. Robertson, like Sarraill, had his doubts. Presently came the first hitch in the military convention negotiations. Rumania was not to move till Aug. 14, and Sarraill was to act ten days before that date. But on Aug. 3, the eve of the offensive, the convention was still unsigned, Rumania having expressed the intention of not declaring war on Bulgaria unless large Russian forces were added to her Danube Army; in these circumstances Sarraill's mission

was reduced to "harassing" the Bulgarian Armies on his front, without ulterior purpose, from a date to be determined later (telegrams from Joffre to Sarraill Aug. 3 and 6). Finally, the convention was signed on Aug. 17, without any engagements on Rumania's part to declare war on Bulgaria. On that very day the Bulgarians began to push forward. Proposals for shortening and improving their line by pushing it forward on the one hand from the Monastir frontier towards Ostrovo, and on the other from Rupel to the angle of the Struma, had, in the spring, been put before Falkenhayn by Mackensen (who still commanded, under somewhat indeterminate conditions, the forces of the Central Powers in Bulgaria and Macedonia). Falkenhayn had declined at the time owing to the risk of bringing Greece into the ranks of the enemy. Now, however, it seemed safe to ignore this danger, and desirable to forestall the relief offensive that would doubtless accompany Rumania's intervention,<sup>3</sup> and on Aug. 17 a series of encounter-combats began between Sarraill's various groups, advancing for their deployment on the frontier, and the wing elements of the enemy. In the centre, the 17th Colonial Division, the British assisting to some extent,<sup>4</sup> took, lost and retook Dodzelli (Aug. 17-8). But on the left the French cavalry group, already mentioned, which was operating E. of the Struma bend, was driven in by a serious Bulgarian movement from Rupel and through the mountains from the Nevrekop region, and, had it not been that the Bulgarians used part of their forces in taking possession of the coveted coastal strip of Kavalla, the Struma line itself might have been forced. As it was both the French cavalry group and the British force further down the river were able to establish a sufficiently strong defence of the river. On the other flank the Bulgarian attack encountered the Serbians in the process of concentrating forward.

The new Serbian Army, commanded by the Prince Regent Alexander, with Boyovich as his assistant, was organized in three weak "Armies," the I. Army under Mishich, the II. under Stepanovich, and the III. under Yurichich-Sturm, who was shortly afterwards succeeded by Col. Vashich; of these the I. was in touch with the left of the French 122nd Div. about Lyumnitsa, the II. on its left, and the III. formed the left wing, advancing methodically and by short stages towards Banitsa. On the 17th advanced elements of the Danube Div. (III. Army) were driven out of Florina, and on the 18th a hasty counter-attack on that point failed. The Bulgarian Army developed considerable strength (6th and 8th Divs. I. Army) and on the 19th, the Danube Div., attacking again, was flung back a considerable distance to beyond Banitsa. Meantime the II. Army, working up in the Moglena district, repulsed such attacks as were made on it, and continued its deployment in front of the Moglena mountains, the left directed on Kaimakchalan, and the I. Army, between the II. and the French left at Lyumnitsa, remained undisturbed.

<sup>3</sup> A new military convention between the four Central Powers had provided that, in case Rumania declared war on Austria, Bulgaria and Turkey would do so against her.

<sup>4</sup> On the 18th the French divisional commander asked for British aid to secure his flanks and enable him to hold what he had won. But, Rumania having refused to declare war against Bulgaria, Milne, having regard to War Office reservations, declined and appealed to Sarraill to refrain from putting him, as a soldier, in the impossible position of being an inactive witness of enterprises that had no chance of success without his assistance. Sarraill, however, says that Milne had promised, before the movement on Doiran began on Aug. 10, that although he was not authorized to take the offensive, he would not leave the French with their flanks in the air. Taking these two pieces of evidence together, the only conclusion possible is that the formula defining Sarraill's authority as commander-in-chief was too limited to be of much practical value in ensuring military unity, yet too extended if the Governments desired to preserve their control of policy. Too much was left to interpretation, and the commander-in-chief was obviously exposed to the temptation of planning his operations so as to create the case for the promised assistance. Indeed Joffre's directions of July 15 contained a personal instruction to Sarraill in this sense (see Sarraill, p. 361, telegram 4977/M., 4979/M., and especially 4980/M. *pour le Général seul*). The story of the Salonika campaign can only be understood by bearing in mind the political and personal undercurrents affecting it,

<sup>1</sup> In the case of the Italian Division the powers of the commander-in-chief were specially limited. The Russians were, however, unreservedly at the disposal of the French. In general the formula from which Sarraill derived his authority was somewhat similar to that which was agreed upon later in the case of Nivelle. It was far from being a real international command such as that of Foch in 1918.

<sup>2</sup> The prevalence in that region of malaria, discovered by experience, had caused Sarraill to abandon the earlier project of delivering a principal attack with three French Divisions on the Belashitsa front in the summer months.

Impressed by the attacks on his flanks and in particular that on his left, and limited by the outcome of the Rumanian negotiations to fighting without ulterior purpose—instructed, further, by Joffre (apparently on the 16th) to attack three days after the signature of the Rumanian convention, viz. on the 20th—Sarrail changed his plan. Everything E. of the Vardar was to be defensive, everything W. of it offensive. On the extreme left irregular bands (which Sarrail had formed or subsidized) were to cut communications between Florina and the S., and to work their way into southern Albania, where coöperation had been promised by the Italian troops at Valona. An improvised French brigade was to move over to support the left of the Serbians by an attack round the S. and W. sides of Lake Ostrovo. The Serbian left was to hold up the Bulgarian advance, and the four remaining divisions to attack Kaimakchalan and the range to the E. of that point, supported by part of the French 122nd Div. in front of Lyumnitsa. East of the river, the remainder of the 122nd Div. was to stand fast, the 17th Colonial to attack W. of Lake Doiran and the 57th to demonstrate E. of it, all available British artillery participating in the effort of the 17th Colonial. The British divisions in this region (22nd and 26th) were to follow, and the Italian Div. of Gen. Pettiti, in process of disembarkation, was to relieve the 57th French Div., which was then to be transferred to the left wing. East of Dova Tepe the defensive front was to be under the command of Gen. Briggs and held by the British 28th Div., the French cavalry group (which was to explore on the further bank as before) and part of the British 27th Div., the remainder of Milne's Army being in reserve.

At this date, according to a French parliamentary paper, Sarrail's total force, combatant and non-combatant, inclusive of all details, had a ration strength of about 350,000 (four French, five British, six Serbian, and one Italian division, and a Russian brigade), and a combatant strength of 145,000 rifles, 3,000 sabres, 1,300 machine-guns and 1,032 guns, of which, however, 36,000 British infantry were not available for general service, and the 11,000 Italians only began to disembark in the last days of August.

During the regrouping process the Serbian left was driven back slowly, but in order, and on the 23rd the Vardar and the Danube divisions were about the N.W. corner of Lake Ostrovo with part of Timok, and the French Provisional divisions and the French 122nd Div. were engaged in various partial combats on the line Kaimakchalan—Lyumnitsa. On the Doiran and Struma fronts small engagements were frequent, and the French cavalry group, which again attempted to operate E. of the Struma, was driven in by superior forces with somewhat heavy losses. The Bulgarian attacks, however, as has been said before, had no more serious purpose than shortening the line and sketching out a sort of preventive attack, and they died down about Sept. 1, at which date the position of the Serbian left was practically the same as it had been on the 23rd, while the Struma front was unmolested.

Meanwhile the Rumanians had come into the field, and Bulgaria had declared war upon them. In a directive of the 24th, therefore, Joffre ordered Sarrail to continue to check the Bulgarian advance, thereby fulfilling his mission of protecting the Rumanian deployment, and to prepare for a counter-offensive, the date and objective of which was practically left to Sarrail's discretion. For this offensive Sarrail relieved the 57th Div. from the Dova Tepe front and the 122nd from the Vardar valley front, the Italians replacing the 57th, and the British divisions already on the spot taking over the whole front from Doiran to the Vardar. This enabled a group to be formed under Cordonnier consisting of the French 57th and 156th Divs. and provisional brigade, the Serbian Morava Div.<sup>1</sup> (released from the Lyumnitsa region by the 122nd), the Russians, and the various irregular bands above mentioned. As soon as this group should be ready the offensive was to be launched against the right flank of the enemy's new line. This

was carried out on the whole front on Sept. 10. On the Struma front (Briggs) six British detachments, and another French cavalry group also, were sent over the river at different points to engage and hold the enemy in that quarter. No permanent foothold was gained or sought, and the troops were withdrawn on the 11th. On the Doiran—Vardar front, after heavy bombardments on the 11th, 12th and 13th, a salient in the position of the German 101st Div. was stormed on the night of the 13–14, but given up under counter-attacks on the following day. The French 17th Colonial Div. and the Italians made similar local attacks, and from time to time other *coups de main* took place as well as patrol activity and aerial bombing, with the object of detaining as many troops of the German XI. and Bulgarian II. Armies as possible, while the main attack was being developed W. of the Vardar. This began on the 11th, both for the Serbians and for the Cordonnier group. The former pushed up towards Kaimakchalan and Vetrenik mountains with three divisions (aided by the French 122nd Div. which carried Mayadag) and grouped the Vardar, Danube and Morava divisions for the attack of the mountain pass of Gornichevo W. of Lake Ostrovo. The Cordonnier group, much hampered in its concentration by road difficulties, and by the piecemeal arrival of the formations composing it, advanced to Rakita and Hill 633 on the Kayalar—Bahitsa road on the 11th, with the Russians, as flank guard at the mountain pass of Vlachoklisura. On the 12th Cordonnier's main body reached Rudnik, the Russians the mountains 1414 and 1348 N. of Vlachoklisura, and a Serbian liaison group occupied Sotir. On the 13th there was fighting along the whole front from Kaimakchalan to the Russian positions, Cordonnier gaining a line at the foot of the Malareka ridge, and on the 14th the Serbs broke through the hostile line at Gornichevo, capturing 32 guns.

Unhappily, in these operations an acute difference arose between Cordonnier and Sarrail. The former, the man on the spot, conducting his offensive on the methodical lines of the battles of France, from which he had recently come and in which he had played a brilliant rôle, moved too slowly to satisfy Sarrail, who, released at last from all restrictions of higher policy, was determined to signalize his name and silence his opponents with a first-class victory. As to which was in the right it will be for history to say; probably it will be found that this is no more than one of the incidents between a higher command in a central command post and a subordinate command in the field that are so common and indeed inevitable in moments of crisis. But the peculiar factors of this case, personal and international, gave the incident a lasting importance. In the event, the Bulgarians, broken by the Serbians at Gornichevo, were able to retreat across the front of Cordonnier's force and reestablish themselves on the line of the Brod, blowing up in their retreat the important viaduct of Ekshisu.

The battle now entered upon a second phase, which lasted from Sept. 15 to Oct. 30. In this period small actions on the Struma and Doiran front were continued; thus the British sent several detachments over the Struma on the 15th and 23rd, and a more serious move was made on the 30th, when Gen. Briggs initiated a methodical advance which brought him by Oct. 8 to the line Agomali—Elishan—Ormanli with advanced elements along the Belika stream facing Seres. On the Doiran front several local enterprises were carried out by the British and Italians. Meantime, on the Adriatic coast, the Italians were moving onwards from Valona along the Voyusa valley, Premeti being occupied on Oct. 9.

The practical effect of these holding attacks and demonstrative moves on the main battle-front between Vardar and Brod seems, however, to have been much smaller than it had been in the first stage. According to Sarrail twenty Bulgarian battalions were shifted over from the British front to that of the French and Serbians in the last days of September. This was only to be expected. When the real front of battle became definite, merely potential battles ceased to possess effective binding power. But the Struma front, though militarily eccentric, had possibilities in the political sense; an advance on that side threatened the Bulgarian occupation of the Kavalla region

<sup>1</sup> In the sequel this division was taken to support the Gornichevo attack, and did not join Cordonnier.

almost before it was established—for the Greek garrisons were still in being. General Milne therefore chose this front on which to exercise such holding action as was possible in the conditions.

On the main battle-front Cordonnier's advance on the left of the new Bulgarian position continued on the 15th and 16th, the Russians in the mountains, combined with a newly constituted French force<sup>1</sup> working round, and the main body moving directly on Florina and the line of the Brod. On the 17th Florina was taken by parts of the 57th and 156th Divs.; on the 18th Sarraill intervened again to press the advance towards the rear of the Bulgarians opposing the Serbians on the Brod and Kaimakchalan front. But, probably from supply difficulties due to the blowing up of the railway viaducts, but also because Cordonnier thought it necessary to clear the mountains on his left before swinging in, the advance came to a standstill again on the 19th. On the 20th the Serbians made an important advance in the region of Kaimakchalan, and held their gains against counter-attack. The Franco-Russian Div. on the extreme left also maintained its positions, and on the 23rd Cordonnier was ready to attack in concert with the Serbians along and W. of the Brod line.<sup>2</sup> But, meantime, reinforcements were arriving on the Brod from the British front, where the policy of demonstrations had at last been detected by the enemy. On the 24th and following days, while the artillery of Cordonnier's force was being got into position for the attack of the Brod line, and the mountain country W. of Florina was being cleared, the Bulgarians made fierce counter-attacks on the Serbian positions about Kaimakchalan. That point itself had been stormed by the Serbians on the 20th, and their hold was not shaken, but it was the 29th before the whole area was in their possession. On Oct. 3 a concerted attack of Cordonnier and the Serbs was delivered on the whole front from Kaimakchalan westward, while the British on the Struma front developed the holding-offensive already mentioned. This general attack was initiated by a vigorous Serbian push in the mountains W. of Kaimakchalan, and, finding their line turned on its left, the Bulgarians fell back, with only rear-guard resistance, to a position defined by four geographical points: German on Lake Prespa, point 1006 in the Baba ranges, Kenali in the plain, the extremity of the Cerna bend and the ridge N. of Kaimakchalan.

This closed the second phase of the battle. The Bulgarians were being effectively held, at the least. As a relief offensive, coincident in date with a new Russian offensive on Brussilov's front, with the seventh Isonzo battle on the Italian, with renewed efforts on the Somme front, and with the battles of Hermannstadt and Dobrich on the two Rumanian fronts, the Balkan battle in its first two phases accomplished all that could be expected of it. But from the point of view of the Salonika forces it was disappointing, especially to the ardent Serbians who at Kaimakchalan had reentered their own country.

The next phase was the general advance against the Kenali-Cerna bend line. It occupied the period Oct. 4-19, and was marked by even more internal friction than the previous phase. The operations themselves consisted in artillery bombardments and local attacks, in which the Serbs advanced to the Cerna bend (7-8 Oct.) and over the river and on to the plateau N. of Velyeselo (Oct 18-19). Otherwise no important progress was made, and, indeed, a set-back occurred on the 6th, when a French and Russian attack W. of Kenali failed with somewhat heavy loss. General Cordonnier thereupon reverted to the idea of a wider turning movement, but Sarraill, who believed, from the reports of his agents and from incidents on the Serbian front, that the whole Bulgarian Army was ripe for a moral collapse, insisted vehemently on direct action. The frontal attack was carried out on the 14th, for the first time with the aid of gas shell, but it failed, with heavy losses to the French and particularly to the Russian contingent. A violent interview on the battlefield between Sarraill and Cordonnier, in the presence of many Allied officers, completed the disorganization of the

command. Cordonnier, who was suffering from almost mortal disease, was sent home a few days later, being replaced for the time being by Gen. Leblois, but for some days the Serbian attack on the Cerna bend went on unsupported, until Sarraill took the step of placing the available French forces under the superior command of the Serbian Gen. Mishich with the idea of restoring moral as well as tactical unity to his dislocated offensive. The necessity of continuing it, and the chances of a striking success if it were persevered in, were equally evident. The Bulgarian *moral* had suffered from stagnation and from the rude shock of meeting an enemy risen from the grave. The German elements of the XI. Army had mostly been withdrawn,<sup>3</sup> its commander von Winckler (who succeeded Gallwitz in July) was in early October no longer under Mackensen's orders but under those of the Bulgarian higher command; and Gen. Otto von Bülow, summoned with the staff of the VIII. Army from Lithuania to take general charge of operations in Macedonia, only arrived in the middle of the battle. No higher purpose than gaining time and avoiding defeat was or could be contemplated on the part of the Germans and Bulgarians, and self-sacrifice in such a rôle requires either the constant *moral* of a professional army, such as that of the old regular divisions of Milne's command, or the crisis-*moral* of the citizen soldier. In these conditions, although the lateness of the season and the sharp enemy offensive in the Dobruja made a junction with the Rumanians impossible, Sarraill had reason to hope for an important victory. In any event, the turn of events in Rumania (Hermannstadt, Fogaras, Kronstadt), and on the Italian front (eighth and ninth Isonzo battles), dictated a continued offensive towards Monastir.

For some days after the Serbian success at Velyeselo weather and counter-attack prevented their further progress, and this time was utilized by Sarraill in strengthening them with French troops drawn both from the Vardar (where the British took over their line), from the western mountains (where the Italians<sup>4</sup> relieved them), and from the centre about Kenali, where the weather flooded the country. At the same time the artillery was established in position, the maintenance service organized to supply the battle, and touch gained on the extreme left with the Italian force advancing in Albania,<sup>5</sup> while Milne's Struma troops made a strong diversion by attacking and carrying Barakli Dzuma (Juma) on Oct. 31. Finally, on Nov. 10, the Serbians with French support opened a new strong attack in the Cerna bend. Between the 10th and the 13th Polog, the ridge to the E., and Iven were taken, while the artillery on the Kenali front kept up interdiction fire to prevent enemy reinforcements from crossing the Cerna; and on the 14th a general attack brought the Serbians to the ridge on which Jaratok Monastery stood, with lesser advances to right and left. The Kenali lines being now completely turned, the enemy on the night of 14-15 fell back, covered by rain and snow, to a position but little in front of the line Peristeri-Monastir-height 1378-Grunishta. But this time the advance did not halt. On the 15th, in terrible weather, the French left pushed forward to the Viro brook; in the mountains, though mud was absent, rain and snow were still more violent, but the Serbians continued to progress. On the 17th Mishich's troops, with the French aiding and conforming on their left, captured height 1212, and the 18th they stormed 1378, pursuing to Makovo in the night following, while the French centre and left forded the Viro, the Russians S. of Monastir took Kanina, Zabiani and Holveen, and the Italians, French and Russians in the western mountains developed an outflanking movement right and left of Lake Prespa.

On the morning of the 19th the town of Monastir was found evacuated, and the third phase of the Allied offensive, definitely

<sup>3</sup> Apart from staffs, there only remained 17½ battalions and corresponding artillery and army troops.

<sup>4</sup> A newly-disembarked Italian force relieved these in their position in the Dova Tepe region.

<sup>5</sup> Apart from the movement of the Valona force up the Voyusa, a fresh Italian contingent had landed at Santi Quaranta and advanced by the Turkish military road to Koritsa, and thence to the region of Ohrida and Prespa Lakes. This line became a regular line of communication.

<sup>1</sup> Henceforward called the Franco-Russian Division.

<sup>2</sup> There was some overlapping of the Serbians and French about Borensitsa, due to a Bulgarian counter-attack on the 19th.

victorious, closed with the occupation of a line from Krani on Lake Prespa<sup>1</sup>—Saddle 2227—Orizar N. of Monastir—Makovo—heights S. of Staravina—N. slopes of Kaimakchalan.

In view of the weather victory had come in the nick of time. The force of the attack rapidly died out, even the Serbian Army with its positive and eager *moral* being too weary, and all formations being too far ahead of their administrative services<sup>2</sup> to be able to push on. Fighting went on in the Cerna bend till Dec. 12; the French operating in this quarter captured Dobromir on the 21st and height 1050 on Nov. 27, and the Serbs Staravina on Dec. 4; but the troublesome height 1248, overlooking Monastir and the plain, remained in the hands of the Bulgarians, and the town was under shellfire throughout the winter.

By this time the evident *coup* of the Rumanians and the consequences of the Venizelist *coup d'état* at Salonika called for a reconsideration of policy. The offensive, considered as a relief offensive on Rumania's behalf, had completed its usefulness, and on Dec. 11, Sarraïl was instructed to establish his forces on a defensive line, holding as much of the regained territory as possible and keeping in mind the resumption of the offensive at a date that was to be fixed according to the general plan of campaign for 1917, and particularly according to the date at which the Rumanian Army, reorganized by Gen. Berthelot, should be ready for the field. Meantime, the contingency of rapid action against Greece was to be provided for.

Henceforward, for some months, it is this last element in the problem which governs the action or inaction of the Salonika Armies. In answer to the Venizelist *coup* of Aug. 30, King Constantine began a threatening concentration of troops in Thessaly, on Sarraïl's left rear. To this the Venizelist forces, hardly yet in being, were no counterpoise, and Venizelos's policy, which was also that of Sarraïl, and as a rule that of the British and French Governments, was to prevent contact between the two Greek parties.<sup>3</sup> Sarraïl therefore drew a neutral zone of some kilometres width from the Koritsa basin to the sea. Nevertheless, throughout the period of his offensive, anxieties for the flank and rear limited the play of such reserves as the Allied commander-in-chief possessed. On Dec. 1 the attempt to enforce the delivery of certain war material to the Entente representatives at Athens produced an *émeute*, in which the Allied landing parties suffered severe losses and the Legations were for a time practically besieged. This affair brought the confusion of the Greek problem to a climax. Though on Dec. 2 Sarraïl's demand for authority to advance into Thessaly was refused, and some disjointed efforts at naval and military action led to nothing, sufficient unity of policy was achieved to enable the Allies to deliver an ultimatum on Dec. 14, demanding withdrawal of the Greek forces in Thessaly.<sup>4</sup>

The policy of the Salonika forces for 1917 was fixed at the Inter-Allied conference held in Rome in Jan., to which Sarraïl was summoned. The first conclusion was that Greece was not to be attacked, both for other reasons and especially owing to the effect that any high-handed action would have on American sentiment, which was at that moment in the crisis of deciding

for peace or war. The second was that operations on the front should be governed by a waiting policy—a compromise between Sarraïl's demand for forces sufficient for a grand offensive, and Robertson's and Cadorna's demand for a withdrawal<sup>5</sup>—and that the divisions sent or to be sent to Salonika should be liable to recall, in the event either of a crisis on the Italian front, or of one in Palestine. On the other hand the full subordination of the British contingent to the Allied commander-in-chief was agreed to,<sup>6</sup> and (according to M. Mermeix) Sarraïl's personality made so favourable an impression on Mr. Lloyd George that the agitation for his recall came to an end for the time being.

In the first weeks after the end of the battle and these decisions, the Salonika front was for the first time formed as a regular and continuous system. On the right, as far as the Vardar, were the British under Milne, consisting now of the 10th, 22nd, 26th, 28th, 29th, and 60th Divs. (the last newly arrived) with some organized units of the Venizelist forces in support. On the left of the Vardar the national contingents were more intermingled, the Lyumnitsa region being held by the French, the Kaimakchalan—Vetrenik—Duditsa front by the Serbs (6 Divisions),<sup>7</sup> the Cerna bend by the Italians (1½ Divisions), and the remainder of the front by the French main body, to the command of which Gen. Grossetti was shortly appointed in succession to Cordonnier. The French Army were now being reinforced, and included besides the old 57th, 17th Colonial, 122nd and 156th, the 16th Colonial (arrived early Dec.), 76th (arrived end Dec.), 30th (arrived Jan.) and 11th Colonial (newly formed from odd units on the spot). In all, therefore, there were no less than 21½ Divisions in this theatre at the outset of the 1917 campaign, besides two Russian brigades, and the Greek National Defence Army in embryo. The Italians in Albania are not counted, as they were not under Sarraïl's command, and operated entirely as a separate force in their own theatre, interesting the Salonika force only in so far that their positions protected the opening up of the line of communication Santi Quaranta—Koritsa—Lake Prespa. This force was strong enough to hold all its line and yet to have larger reserves than in 1916, for either an offensive northward or a march into Thessaly.

The Bulgarians on their side established themselves solidly on the final battle line of 1916, and improved it on Feb. 15 1917 by the recapture of height 1050 in the Cerna bend from the Italians, who had only shortly before taken up this sector. An attempt to retake it failed on the 28th. The end of active operations against Rumania about the middle of Jan. released additional Bulgarians for the Salonika front. As a beginning Sarraïl sent his newly arrived 76th Div. inland to Koritsa<sup>8</sup> just in time to prevent the seizure of that point by an Austrian force coming down from Pogradets (early Feb. 1917); the division then moved on to clear the Santi Quaranta road—the new alternative line of communications—of bands and make the junction with the Italians in Albania, which at present only existed by wireless and aeroplane. This mission was completed by the meeting of the French and Italian troops at Ersek, Feb. 17, after which the limit between Sarraïl's International Army and the purely Italian force of Gen. Ferrero in Albania was fixed at a little N. of that point. The 76th Div. was then

<sup>1</sup> The French on the W. side of Lake Prespa occupied Liskovats, a village on the same latitude as Krani, and then Horesovo.

<sup>2</sup> The viaduct at Ekshisu was not repaired till Nov. 27.

<sup>3</sup> The first battalions organized by the Venizelists were sent to the British front on the Struma. At one time the idea seems to have been entertained of reconquering Eastern Macedonia (Drama—Kavalla region) by means of an advance of these troops, presumably in concert with a British expedition. Nothing, however, was done in this direction. The regular Greek forces on this side, cut off by the Bulgarian invasion, had accepted an offer of internment as "guests of the German Government" (Sept. 14) and were transported to Germany, except a small force which from Seres had made its way to join the Allies.

<sup>4</sup> In the midst of these events came mutterings of trouble in the Serbian Army. Little is known as to the details, but as early as the beginning of Jan. 1917 a division commander and several brigade commanders and senior staff officers were deprived of their posts; by mid-March over twenty such officers were in prison at Bizerta charged with plotting against the Prince Regent. Finally, a number of these were brought to trial, some being condemned to death and (July 29) shot, others sentenced to 15 years' imprisonment.

<sup>5</sup> The idea of a Salonika front had never had any real support in the British War Office, and the Italian point of view seems to have been that the abolition of an Inter-Allied force in the Balkans would give Italy greater freedom of action in Albania.

<sup>6</sup> Sarraïl had already been released from control of the French G.O.G. when Joffre left it and was replaced by Nivelle (Dec. 1916).

<sup>7</sup> Owing to losses the Serbian Divisions were now reduced from the old high establishment and were equivalent in rifle strength to French Divisions, viz. 9 three-company battalions.

<sup>8</sup> Here, in the previous summer and autumn, French cavalry had operated to disperse irregular bands that were practically bandits, and to intercept communications between Athens and the enemy. For a time Venizelist sympathizers reigned at Koritsa, and the idea of annexing the district to Greece was not far in the background; but in the face of protests from Italy and from Essad's Albanian party at Salonika, Sarraïl replaced them by an autonomous government of inhabitants under French protection, a course which he considered would commit nobody and yet give no excuse for the formation of Royalist bands.

reassembled N. of Koritsa, in readiness to participate in the general offensive when this should be ordered.

Meantime the British advance beyond the Struma, originally developed out of the demonstrations made during the first stages of the Monastir offensive, had been consolidated on the line Jenimah—Osman Kamila—Hrostan Kamila—Nevolyen—Kukuluk—Elishan—Barakli Dzuma—Alipsa (Ali Pasha). This position formed a useful bridgehead in case Sarraill should be able to resume the old scheme of an offensive by way of Demir Hisar and Rupel against the Bulgarian communications, and meantime it immobilized a Bulgarian force of approximately equal strength. But the supply of the lines beyond the Struma was difficult and laborious during the winter months, and it was to be expected that the valley would be a hotbed of disease in the summer. On the Doiran front several small local attacks were made on the enemy's positions on and about Dub mountain—the Achi Baba or Hermada of this front.

The scheme which Sarraill intended to carry out was the old scheme of a principal blow from the mountain front in the direction of Demir Kapu, cutting off the defenders of the Doiran and Lyumnitsa fronts. Combined with this, local and subsidiary advances were to be made on the Cerna bend and Monastir fronts, with, to the left of all, an enveloping movement by the 76th Div. from Koritsa by Resna upon the rear of the Bulgarians N. of Monastir. Meanwhile, the British, after exercising a holding action which was to increase in intensity from left to right and culminate in a real attack on Seres, would quickly shift their centre of gravity to Demir Hisar, and thence, by Rupel and the Struma, force their way to a position on the rear of the Bulgarian line of retreat. If, as in 1915, Sofia was to be the ultimate objective—if, in short, the campaign was intended to be a decisive one—the sweep of the extreme left would pass through Uskub and Kumanovo, that of the left centre through Veles and Shtip, while the Italians bore down on Demir Kapu and the British marched on Simitli—a romantically complete success. In many ways, indeed, the scheme is identical with that eventually carried out by Franchet d'Espèrey in Sept. 1918. But in both cases there were four postulates:—(a) Greece friendly or under entire control; (b) synchronization of the offensive with those in the main theatres, so that the enemy could not transfer German reinforcements in time to the Balkans; (c) enough men; and (d) enough material. Of these postulates Franchet d'Espèrey was in the sequel to possess all four. Sarraill, on the other hand, though (b), the most important strategically, was within his power, had little real security as to (a) and a definite lack of means in respect of (d), and this last ranked as one of the most important factors for the tactical break-through on which all the rest depended. Several of these requisites being absent, Sarraill was under no illusions as to the chances of pushing success to the gates of Sofia. But he considered that there was a possibility, becoming a probability if he were given more heavy guns, of forcing the offensive of his left centre in the mountains so far north-eastward as to compel the evacuation of the Lyumnitsa—Doiran—Belashitsa front. In the absence of these additional heavy guns, however, the tactical break-through in the Moglena—Cerna region would be a matter of great difficulty, and Sarraill accepted a proposal of Milne that the British holding attack should be delivered on the Doiran front—where its effect on Sarraill's battle would be immediate and tactical—instead of towards Seres. This change of plan, made between Feb. 9 and 19 was due in the first instance to the difficulties of movement in the Struma valley, where exceptionally bad weather had made motor transport almost impossible. But the decision was one of grave importance since the height of Dub, now chosen for the British attack, was one of the strongest points on the whole front, and it was an attack, and not a demonstration, that was intended.

In this form the scheme was accepted by the Inter-Allied conference that met at Calais on Feb. 27—in circumstances of great tension—and Sarraill was ordered to hold the enemy to his ground, and authorized to seize any opportunity which offered itself to inflict real damage. So far this represented

merely the waiting policy of the Rome conference. But an important modification of that policy was implied in the actual instructions to Sarraill, for not only was he told that the plan of operations had been agreed to by the British War Council, but he was instructed to be ready to launch his offensive about April 15—a few days after the date selected for Nivelle's battle on the Aisne—in spite of the fact that no Russo-Rumanian offensive could be expected so soon. That authority should be given for an attack of any kind in the conditions of the time was of doubtful wisdom. But that the conference sanctioned an attack on the strongest parts of the enemy front in order to obtain the very limited results at which it aimed is a fact that is more than difficult to explain. The strategic results that would or might accrue from a break-through in the Moglena region were indeed so great (as 1918 showed) that special tactical risks might fairly be taken to achieve this break-through. But the conference of Calais not only had no great strategic results in mind, but had expressly agreed that the circumstances of the time excluded them. And when, in addition, we find that Sarraill was, at one and the same time, told that the decisive defeat of the Bulgarians was excluded, and instructed to "take"—according to the Calais *procès-verbal*—or "seek out"—according to the French Ministry of War telegram—"every favourable opportunity for inflicting a serious check," we can only conclude that the Calais conference was so preoccupied with troubles nearer home that it could think of nothing better, as regards Salonika, than to shift the responsibility and trust to luck.

But before the offensive period arrived events had already blurred the scheme. The British were to attack the Dub, and demonstrate at other points; the French, Russians and Italians in and W. of the Cerna bend were then to move, and lastly the Serbians were to deliver the principal blow between the Cerna and the Duditsa mountain, E. of which were the French 122nd Div. and part of the Greek "Archipelago" Div. (the first of the Venizelist National Defence formations), ready to drive forward on the Huma—Vardar front so soon as the flank attack had begun to make itself felt. But the Serbians, still angered by the breakdown of joint action in the Monastir battle, and also seriously affected by their internal troubles, refused to move till after the Allied general offensive had opened in France. The Russians were deeply shaken by the revolution in their own country. Weather conditions were terrible, and the zero day of battle was several times postponed, both owing to these conditions and to the slowness with which the preliminary offensives at and W. of Monastir were developing.

As early as March 12 the French 76th Div. had begun its advance from Koritsa on Resna. But owing to snow and to the harrying tactics of enemy irregulars—who were supported by small Austrian forces from Pogradets—it made but little progress, and on March 19 Sarraill suspended the movement. Meanwhile, on the 18th, Grossetti, after several days of local attacks, delivered a larger attack on the front N. of Monastir, which by the 27th had advanced the line in this sector to height 1248, Snegov and Rastani, with corresponding gains to the left on the spur of Peristeri called Crvena Stena, and to the right about Dobromir and height 1050. Over 2,000 prisoners were taken, and these gains eased the uncomfortable position of Monastir, but they were not pressed, as Sarraill not only held his reserves for the April offensive but sought to disengage part of the troops engaged at Monastir for the same purpose.

On the Doiran front the British attacks began about the middle of March with enterprises intended to secure advantageous positions for the general engagement. On April 22, after several postponements, the artillery preparation began, in terrible weather, and on the evening of the 24th the infantry assault was delivered on a two-division front against Dub and its under-features. The positions of the defence were strong in themselves and strongly entrenched, and, as in the trench-warfare battles of the French front in 1916-17, the attack preparations and especially the prolonged bombardment had given full warning. Along the whole front the infantry reached

the hostile front trenches, but only on the left were they able to maintain the ground won, and nowhere was progress made beyond the first enemy system. Heavy fighting, which only died down on the 28th, was necessary to consolidate the new line, and meanwhile for "climatic and other reasons"—to use the words of Milne's despatch—the rest of the front remained inactive. It was only on May 5 that the other secondary elements of the battle (W. of the Cerna, Cerna bend, Lyumnitsa-Mayadag front) began their artillery preparations. At last, on the 9th—in the case of the British the evening of the 8th—the infantry went forward on all fronts. The British, attacking between the Petit Couronné and Lake Doiran, were repulsed, but they made good an advance further W., where 500 yards in depth were gained over a frontage of two miles; these gains were held and consolidated. On the Lyumnitsa front the French 122nd Div., aided for the first time by Greek forces, carried out methodical advances by fractions at a time, and even for a moment held the Srka di Legen. Elsewhere all holding attacks were repulsed after the usual momentary successes. But the serious feature of the situation was the fact that the Serbians, who were to have been the shock element of the attack and to have begun their advance on the 9th, like the rest, came to a standstill on the 11th after engaging only one of the three divisions between Kaimakchalan and the Cerna. More, they asked to be taken out of the line, and with this the offensive scheme practically collapsed. Sarrail did, indeed, induce them to engage again with two divisions, and on the 15th attacks in aid were delivered or threatened at other points.<sup>1</sup> This time, after some loss, they demanded that the offensive should be abandoned altogether. Already Sarrail had received authority from Paris to suspend operations and establish his defensive line (May 15), and on the 23rd, after the second Serbian disappointment, he issued orders accordingly. It could be claimed, with justice, that these operations had pinned the Bulgarian Armies to their ground, and indeed only one Bulgarian division remained in the Danube theatre, all the rest having been drawn into the Balkans by the developing threat of the offensive. But Sarrail had hoped for much more. His object had been Veles and Demir Kapu at the least, instead of which only slight advances on the Struma, Doiran, Lyumnitsa and Monastir fronts—without exception secondary elements in his scheme—had resulted. The offensive was, in short, a failure, and one, moreover, in which it was palpable that disunity had played the major part.

The reasons are to be sought partly in the Serbian breakdown and partly in the general war situation. Allusion has already been made to the fact that the Serbian Army had for some time been passing through an internal crisis, and to the demands made by the Serbian Government and higher command for tangible evidence that all the Allies would frankly engage their forces in the battle. The engagement of the French and Greeks on the Lyumnitsa front, and above all that of the British on the Doiran front, where attacks were made in earnest, local gains secured, and heavy losses incurred<sup>2</sup> in aid of the projected main attack, might have been supposed to be an effective answer to this last demand, even though the Italians and French in the Cerna bend showed no great vigour.<sup>3</sup> But in fact it is premature to enquire how far a sense of having been left in the lurch in the autumn battle and how far internal troubles respectively contributed to the Serbian refusal. In any case a strong motive at the back of all others was that expressed in the phrase, "What is the use of delivering Serbia if no Serbs are left to inhabit it?" But there were other elements of discouragement. Exalted hopes of a great general advance to victory on all fronts had been dashed to the ground by the Aisne battle and its tragic consequences, and they were followed by a revulsion in which the war-weariness, soldiers' grievances,

and the tremors of revolution produced alarming mutinies. The Russian contingent was affected not only by the revolution,<sup>4</sup> but by rumours of what had happened to their comrades in France, and they in turn affected the Serbs. When, on the main front and in the presence of the main enemy, the *moral* of a homogeneous army was shaken to its foundations, it was not to be expected that on this secondary front a patchwork of contingents, every one of which was exiled from its homeland, would fare any better.

In the midst of these conditions of exasperation the Greek question at last came to a head. M. Jonnart was sent out as Allied High Commissioner, and Sarrail was authorized to invade Thessaly (June 10). He had already begun to prepare a force for this purpose immediately the offensive was abandoned, and, to make certain, other troops went to Athens, to Corinth, and to Itea in the Gulf of Amphiassa, whence a line of supply for the Thessaly force was opened via Bralo. Except for a skirmish at Larisa on June 12 no fighting took place. The dethronement of Constantine and the succession of King Alexander, with Venizelos as his first Minister, were successfully accomplished and most of the troops withdrawn again during July.

But the settlement of the Greek problem came too late to have any influence on operating against Bulgaria. The events of the Spring had affected governmental policies as well as common men's passions. Thus, the British War Office began to withdraw troops for the forthcoming Syrian campaign; the Italian Government began similarly to press for the withdrawal of their 35th Div. for operations in Albania; and the French Government, reconstituted after the Aisne crisis, had made it a definite policy to economize the reduced man-power of France by avoiding battle. Meantime, the Italian advance into Epirus, made concurrently with the French operation in Thessaly, antagonized Greek opinion, the relations of Greeks and Serbians were little better, and those of the French and Italians at the margin of the respective spheres of occupation in Albania none too good. The personalities of the Venizelist, and those of the regular Greek Armies, now to be amalgamated, were inevitably opposed. Finally, Essad Pasha reappeared, with a national Albanian policy and the nucleus of an Albanian contingent.

Sarrail, nevertheless, attempted to maintain a certain military activity; in particular, an enterprise on the extreme left was carried out by a French force under Gen. Jacquemont,<sup>5</sup> which captured Pogradets (Sept. 11) and thence advanced N. almost to Lin. In Oct. a further advance was made into the upper Skumbi valley, but this was suspended, owing to representations by the Italian Government, and the French then withdrew to Pogradets, leaving Essad's bands to operate in the Skumbi region independently. Finally, the whole front relapsed into practical stagnation.

On Dec. 10 Sarrail was relieved of his command by the new Clemenceau ministry on the renewed demand of the British and Italian Governments, and of General Foch in his capacity as chief of the staff of the French Army. This put an end to a situation which had become impossible. The proximate cause of his dismissal, so far as the French Government was concerned, had nothing to do with Salonika, but was Sarrail's relation to the parties of the Left, who, in the troubled summer of 1917, had become pacifist in character, and were suspected, rightly or wrongly, of dealings with similar elements on the enemy's side.<sup>6</sup> So far as the Allies were concerned, it was due partly to the personality of Sarrail, and partly to the insistent and thrusting policy of France in dealing with Greece. In effect, the over-

<sup>1</sup> It is only just to record, however, that to the end of the year they continued to take their share in duties in the line. The evidence of Sarrail, especially p. 289, is emphatic as to this.

<sup>2</sup> The superintendence of this operation was the last service of Gen. Grossetti, who left Salonika on Sept. 24 suffering from poisoning, like his predecessor Condorrier. He died a few months later.

<sup>3</sup> M. Clemenceau in his explanation before the army commission late in Dec. 1917 seems to have laid stress principally on the fact that unless satisfaction was given to the Allies in respect of their complaints against Sarrail, they would not accept a French Commander-in-Chief on the western front. (Mermeix.)

<sup>1</sup> The British on the Struma took Kupri and Ernekeui on this day.

<sup>2</sup> According to Sarrail the British losses in the two offensives were 8,000.

<sup>3</sup> The Russian brigade in the Cerna bend on the contrary *s'est fort bien conduit*, according to Sarrail (p. 257).

throw of the Constantine régime was the only logical outcome of maintaining a Salonika front at all. But between that logical extreme and the other logical extreme of evacuation, which was always the desire of the British War Office, diplomacy built up a series of compromises which satisfied nobody. It was to the indefinite and equivocal position created by these compromises, even more than to any military factors or personal disagreements, that the positive ineffectiveness of the Macedonian forces was due. It remains to the credit of Sarraïl that he was sanguine in the most confused and difficult conditions and resolute in carrying the occupation to a common-sense issue. In spite of proposals to retreat again into the entrenched camp, he maintained the army on the front from which, nine months later, it was to deliver the great offensive blow for which he had always hoped. On the other hand he left the Allied Army in a state of badly shaken *moral*. The consciousness of ineffectiveness, the blight of malaria, the infrequency of leave, the sense of being a forgotten "side-show," the international causes of friction—all these factors told on the *moral* of the Salonika forces at the most critical period of war-psychology.<sup>1</sup> A period of *remise en main* was necessary before the troops could be employed either in this theatre or in another, and Sarraïl had taken the line of defending his army against all criticism, fair or unfair. It was essential, therefore, if the army was to be pulled together, that new men should be put in power.

General Guillaumat, the new commander-in-chief, set himself to this task under favourable conditions. No important military operations were in prospect. The Greek danger had been liquidated. The atmosphere of exasperation was largely dispersed by his appointment alone. With Russia and Rumania in collapse, and the final military trial of strength obviously imminent in one or both the western theatres, not one of the three great Powers concerned was inclined to press its Balkan interests very closely. His military position, too, soon came to be much stronger than that of his predecessor. Although the British had withdrawn two of their six divisions (the 60th in June and the 10th in Sept. 1917, both proceeding to Syria), and one battalion per brigade in the four remaining (spring 1918), the French and Italian contingents remained practically unaltered (save for the withdrawal of the Russians), while the Serbians acquired a whole new division created from Yugoslav prisoners of war, and the Greeks were taking their place as a regular Allied contingent, the "national defence" divisions at Salonika (Archipelago, Crete, Seres) being augmented by those of the regular army, reorganized by a French military mission.

The question of the use of these forces had been put on one side by the central councils of the Entente. German pressure on the Western Front, beginning with March 21 and culminating on July 15, threw all other questions into the background, and when the tide began to recede it proved as difficult as ever to convince the directors of the War that good could come from a Salonika offensive, while, at the same time, it was impossible to offer the Central Powers the opportunity of repeating at Greece's expense their customary autumn triumph. No decision imposed itself and none was taken. The only event of the early summer was a brilliant *coup de main* with limited objective, which on May 30 carried the Srka di Legen on the left of the Vardar. In July Guillaumat, after practically completing the work of reorganization, was recalled to Paris, where an energetic governor was needed in case of a German breakthrough. He was succeeded by Gen. Franchet d'Espèrey. At Paris he continued to act as advocate of, and so to speak agent for, the principles of a Salonika offensive. After much persuading he obtained for his successor authority to prepare one, but authority to begin was not given till a few days before the battle. Meantime, operations in Albania, which for two years had been in the nature of post and police warfare, rose for a moment in the summer of 1918 to the level of major operations.

In the winter of 1917-18 the posts of the Italian XVI. Corps (Gen. Ferrero) in Albania ran along the Voyusa from the sea

to Memaliadz, where it turned abruptly N. and then N.E., facing Glava and Cafa Glava, Parasboar, Barguzyasi, and Cerevoda. Here it joined the French posts, which ran in a N. to S. line along the mountains to Golik in the Skumbi valley and thence nearly E. to Point 1704 S. of Lin on the shore of Lake Okhrida. Early in July 1918 a frontal advance of Ferrero's Italians from the Voyusa and combined by flank pressure by the French 57th Div. in the mountains of the Devoli regions, forced the two Austrian Divs. (47th and 81st) of Gen. Können-Hozak's XIX. Corps to evacuate the whole Berst region in haste, with a loss of nearly 3,000 prisoners. By July 20 the Italians lay along the Semeni and the lower Devoli from the coast to Petrohaudi (with a bridgehead in front of Fieri), and thence in an E. to W. line to the foot of the Mati Siloves range which was held by the French. The positions of the latter formed a marked salient, the apex of which lay at the confluence of the Holts and Devoli rivers, and the right flank of which passed by Kumichan to Golik on the old front. The importance of this salient lay in the fact that it kept the right wing of the general line echeloned well forward, threatening the rear of the enemy's lines near Berat and ultimately the connexion between Elbasan and Lake Okhrida.

In August the Austrians, now commanded by Generaloberst von Pflanzer-Baltin and reinforced by the 45th Div., as well as by the fresh 12th Bulgarian Div. in the Okhrida-Skumbi sector, began a counter-offensive all along the line. Between August 20 and 24 they recaptured the line of the Semeni and the Devoli and drove back the Italians to positions only slightly in front of Fieri and Berat. On August 24 those towns fell again into their hands, and the Italians then withdrew to a line from just S. of Fieri, along the Janitsa, S. of Berst, and along the Osum to Mt. Tomor. Meantime, the French, the left rear of their Devoli salient being thus threatened, had had to fall back in the Devoli and Tomorica valleys to regain touch with the Italians at Mt. Tomor, while still holding on to their posts between the Devoli and the Skumbi. These operations are of interest as being the last military success won by forces of the Central Powers in the War. Three weeks after their conclusion the Bulgarian front was in ruins.

At the close of these operations and the eve of the final act on the Salonika front, the numbers and positions of the forces of the Central Powers were approximately as follows: In Albania, XIX. Austro-Hungarian Corps (45th, 47th, 81st Divs.) under Generaloberst von Pflanzer-Baltin; between Skumbi Valley and Lake Okhrida the 12th Bulgarian Div.; from Lake Okhrida (exclusive) to Kozjak Mountain (inclusive), the XI. German Army (Gen. von Steuben), consisting of, from right to left, the LXII. German Corps staff, with under it the Bulgarian 1st, 6th and Composite Divs., and some few German and Austrian units, the LXI. German Corps staff, with the 302nd German Div. (staff German, troops Bulgarian), the 4th Bulgarian and the 2nd Bulgarian Div., and the 3rd Bulgarian Div.; from E. of Kozjak to Lake Doiran (inclusive) astride the Vardar, the I. Bulgarian Army (Gen. Nerecov), three Bulgarian Divs.; from Lake Doiran (exclusive) to Lake Tahinos (inclusive), the II. Bulgarian Army (Gen. Lukov), three Bulgarian Divs.; from Lake Tahinos to the mouth of the Struma, thence eastward in coast defence positions, the IV. Bulgarian Army (Gen. Petrov), two Bulgarian divisions. The whole of these forces were under the control of the German headquarters, which had formerly been Mackensen's and Bülow's but was now the *Armeegruppe Scholtz*; Gen. Scholtz was, however, for certain purposes under the control of the Bulgarian higher command, at Sofia, over which Todorov presided. An exact account of the forces of Bulgaria at the crisis can hardly be given,<sup>2</sup> but, save for one division in Rumania and some coast

<sup>1</sup> Nevertheless it is clear that the phase of the mutinies passed off more easily than the corresponding phase in France.

<sup>2</sup> Some of the newer divisions had an irregular constitution whereas the older ones still retained the six-regiment organization of 1915, and some of these even the old four-battalion regiments. Moreover, at that moment movements were in progress for replacing 15 German battalions by 45 Bulgarians; the Germans had departed, all but three battalions, but few of the Bulgarians arrived in the XI. Army in time.

defence units in Thrace and E. Macedonia, the whole of Bulgaria's mobilizable force was present between the Devoli in Albania and the mouth of the Struma. In the depots were practically only the 1919 class recruits, just called up; 55,600 men had fallen in battle since 1915, some thousands were prisoners, many thousands had died or been invalided. Thus the ration strength of the Bulgarian Armies on the Macedonian front can hardly have exceeded 420,000, with some 8,000 Germans (principally Jäger battalions, heavy artillery and mountain machine-gun detachments). The combatant strength may be taken roughly as 310,000 Germans and Bulgarians. The Italians of Ferrero and the Austrians of Pflanzer-Baltin, whose operations in Albania were entirely unconnected with the battle on the main front, are ignored in this calculation.

On taking up their battle grouping the larger formations of the Entente Armies were arranged thus: Devoli valley to Staravina (E. of the Cerna bend), the French Army of the East, in seven French, Italian and Greek Divs.; Staravina to Nonte (exclusive), the Serbian I. and II. Armies under Boyovich (3 Divs.) and Stepanovich (5 Divs.) respectively, the latter consisting of the Strumaja, Timok, and Yugoslav Divs., and the French 122nd and 17th Colonial Divs.; Nonte to Lyumnitsa, Gen. Anselme's group, Greek and French Divs.; Lyumnitsa to Dub (exclusive), astride Vardar, 26th and 27th British Divs.; Dub to Dova Tepe, 22nd and 28th British and two Greek Divs.; Dova Tepe to mouth of Struma, 3 Greek Divs.; Salonika, 1 Greek Div.; in all, 28 divisions. In addition there were a small Serbian cavalry Div., a French cavalry brigade, and other lesser formations and details. The ration strength of these forces, after making allowances for men invalided during the hot months, was about 550,000, and the combatant strength perhaps 350,000.

In sum, then, there was no great numerical disparity between the opposed forces. The equipment of the Entente Army in heavy artillery was, however, considerable. Sarraill's repeated requests for an adequate equipment in this respect had been in the end met, just before his recall. As to the number of heavy batteries on the other side accounts differ, but in any case the regrouping of guns to meet an attack, in the movement conditions of Macedonia, would be difficult if not impossible for the defence, and the mere possession of a reserve of such artillery was, in the conditions, a big element in favour of an attack, provided the duration of the artillery phase of it was reduced to a minimum. On the other hand, to oppose to the powerful material of attack, the Bulgarians had all the advantages of natural and artificial strength of position. But the success or failure of an offensive would turn more on *moral* than on material factors. Presuming that the tactical break-through was possible, would the Bulgarians knit up again on a new line further back? Or would it be found that the third winter had completed the war-weariness on which Sarraill had twice vainly counted, so that one heavy blow would finish the matter? In the light of events the answer is easy. The new government in Bulgaria was pacifist in character. Ludendorff regarded a breakdown as almost certain and detailed several divisions from the eastern front early in Sept. to proceed to Bulgaria and Serbia, the nearest indeed being ordered to Sofia to keep order. On the front itself, according to German accounts, conditions were "indescribably pitiful," and for food the greater part of the troops were dependent on ox-transport from a base 60 m. distant, and upon what they had themselves grown behind the lines, this last fact indeed making it almost impossible to induce a unit to quit its sector for a concentration. But 1917 had for the Entente been a tragedy of disappointments founded on optimistic estimates of the enemy's broken *moral* and vanished man-power, and in 1918 a not unhealthy scepticism prevailed in their intelligence staffs, although it was agreed that Bulgarian *moral* was low. Then, too, there was the question of Serbian *moral*. Since the deadlock of May 1917 the Serbians had consistently followed the principle that it was useless to rescue Serbia if no Serbs were left to inhabit it, yet they alone possessed the fire and passion which would convert tactical victory into

strategic triumph, who would disregard food and rest sufficiently to exploit success by leaps and bounds, who would not stop short of the Danube. And nothing less than victory without remainder would be of any value to the Entente.

When the plans were under consideration this latter question was unexpectedly answered by the Serbs themselves. They proposed an offensive with limited objective in the Moglena sector, *i.e.* that lying between Kaimakchalan and the Srka di Legen. At once the situation was cleared up. If they were ready to carry out an attack on the mountain front for no more than a limited objective, it was unlikely that an offensive from that group with the objective of Belgrade would not fall to pieces as in 1917. On June 29 the plan was definitely fixed, and about July 7 the Serbian headquarters (now directed by Mishich) agreed to engage all its forces in the operation. The date of the offensive (which needed a good deal of material preparation as the Moglena sector had never been equipped for battle) was fixed for Sept. 15, though, owing to objections and preoccupations in Paris, the higher command did not give leave to carry it out till little more than a week before that date (Sept. 4).

On Sept. 14 a bombardment opened which, less overpowering than those of the western front, was far heavier than anything previously witnessed in the Balkans. Next day—the original date—the offensive was launched. From the Lechnitsa river to the Sokol mountain the I. Serbian Army (Boyovich), consisting of the Danube, Drina and Morava Divs., had a frontage of 5 kilometres per division. From Sokol to the Suchitsa brook the II. Serbian Army (Stepanovich) formed the break-through force. In front of the Dobropolye were the two French assault Divs. with the Shumaja Div. on their right, and the Exploitation Divs., Timok and Yugoslav behind them. The I. Army and the Exploitation Divs. were not to move till the French had carried Sokol, Kravitsa and Vetrenik heights. Then, passing through, the Yugoslav Divs. were to master the Kozia, and the II. Army front was to advance at the utmost speed on Gradsko, flank-guarded by the I. Army on the left and the Timok Div. on the right.

The attack succeeded according to programme. It continues to be a matter of controversy whether the Bulgarians offered an earnest and fierce resistance. The impression left on the Allied infantry was that they did so; the Germans in their midst assert the contrary. In any case, it is probable that the backbone of resistance was the German mountain machine-gun detachments which were dispersed in the battle zone. Be this as it may, the French Assault Divs. carried their objectives by the evening of the 15th, the Yugoslav Div. passed through them in the night of the 15–16, carried Kozia on the 16th, and on the 17th drove a deep wedge, of which the point was armed midway between Gradsko and Demir Kapu, and the lengthening left flank along the Cerna was taken up by the I. Army. On the other side there was little or no tactical handling in the ensemble. Machine-gun groups and specially resolute parties of riflemen in broken ground constituted the whole resistance. This, indeed, was the typical form of defence in all theatres of war by 1918, but here it lacked the essential element of organized counter-attack. Here and there a unit turned upon its pursuers, but in the main the rear of the enemy's position was void of reserves, although it is said that only 12,000 Bulgarian and German infantry were in line on the front attacked. Later, all attempts at reinforcement always failed, as the troops concerned had to traverse instead of following the valleys and ridge-systems. In sum, by the 19th, the wedge had developed two horns, of which one, following the Cerna, was at the outskirts of Kavadar, and the other was engaged in rolling up the front opposed to Anselme's group.

Meanwhile, on the 18th, the British and Greeks of the Doiran front, under orders from Gen. Franchet d'Espérey, assaulted the whole enemy line from the Vardar to beyond Lake Doiran, with the general idea of cutting the communications between the Bulgarians opposed to Anselme, and the apex of their own country at Strumnitsa. Here, at any rate, the Bulgarians

fought vigorously. Their positions were as strong by art as the Moglena positions were by nature, or stronger, and the attack lacked depth owing to the detachment of a division to work with Anselme's force, and to the low effective strength of units.<sup>1</sup> Thus it met with the same fate as those of 1917—small gains of ground consolidated and held after far larger gains had been for a moment achieved. A second attack next day was no more successful. But for these critical days a large force of the enemy had been completely held.

On the 20th and 21st the exploitation of the break-through was completed. The Serbian I. Army, no longer simply guarding the flank of the II., crossed the Cerna and began a drive along the mountains of the Cerna bend to which the Italians and the French of the "A.F.O." conformed little by little. The Serbian II. Army reached the Vardar between Krivolak and Demir Kapu, and its right horn continued to push due eastward along the mountain positions in front of Anselme's force, which progressively came into action from left to right. By the afternoon of the 21st the Doiran-Vardar front was in collapse, and the British aeroplanes were bombing the intermingled troops and transport of the enemy which was seeking to make their way through Kosturino to Lyumnitsa.

From that day, though progress was sometimes slow, sometimes fast, the Allied offensive became a strategic pursuit in the full sense of the word, marked by a consistent policy of outflanking, as rapidly as possible, any solid line of resistance which the enemy managed to create. Thus, on the 24th, the resolute front offered by a hastily assembled German force on the line of the Vardar near Gradsko (the administrative centre and organized base of the enemy's centre) was turned on the N. by the steady advance of the Serbian I. Army on Veles (24th–25th), and once released thereby the Serbian II. Army marched at high speed on Shtip (25th), Nochava (26th), and Tsarevo Selo (27th), behind the rear of the forces that were giving ground before the British, who in turn worked down the Strumnitsa basin and (in concert with the Greeks further to the right) ascended the upper Struma region, with their aeroplanes sent ahead to bomb the Kresna defile.

Thus, too, when infantry fighting threatened to become stable between Veles and Shtip, the French cavalry brigade under Gen. Jouinot-Gambetta, instead of becoming involved in the Veles fighting, made an independent dash upon Uskub, and to the astonishment of both sides seized that vital centre on the morning of the 29th. This event, which secured the communication between the (so-called) XI. Army and the remainder of the Bulgarians, forced the latter into the region of Egri Palanka, and the former into that of Kosovo. Thenceforward the I. Serbian Army, with the upper Morava as the axis of movement, moved steadily northwards with its right on the Bulgarian border, and its left following approximately the line Gilau-Kinshumlia-Kraljevo, reached Racha-Krushevat-Pirot on Oct. 15, Kraljevo-Paracin-Zajechar on Oct. 23, Pozharevats-Arangelovats-Uzhitsec Oct. 28, Belgrade-Lyuboviya on Nov. 1, and the old barriers of the Drina, Sava, and Danube on Nov. 4. Meantime, the II. Army had reconquered Kosovo and the Sanjak of Novipazar, reaching Priboj and Plevlje on Nov. 1. By that time the strategic pursuit further E. had become a series of movements authorized by the terms of an armistice, and to the W. Pflanzer-Baltin was evacuating in turn Albania and Montenegro, with, as his only purpose, the maintenance of his divisions as formed military units. The Balkan Campaigns were at an end.

For the Salonika campaigns 1915–17, the principal authority is Sarail's *Mon Commandement en Orient*, which is profusely documented; with this should be taken Gen. Milne's despatches. The German part in the Cerna bend battles of 1916 is described in K. Lubmann's monograph *Herbstschlacht in Masedonien*, written from official archives. The crowning offensive of 1918 is dealt with fairly fully in C. Photiades *La Victoire des Alliés en Orient*. (X.)

**SALTING, GEORGE** (1835–1909), British art collector, was born at Sydney, N.S.W., Aug. 15 1835. His father, a Dane, had

made a large fortune by sheep-farming and sugar-growing, and on inheriting this Salting devoted himself to collecting, with great taste and discrimination, Chinese porcelain and English and French furniture and pictures. He led a very simple life and was of retiring and somewhat eccentric habits. On his death, which took place in London Dec. 12 1909, it was found that his priceless treasures had been left to the nation. They are now housed in the Victoria and Albert Museum, the British Museum and the National Gallery.

**SALVADOR** (see 24.96).—The estimated pop. in 1912 was 1,161,425; in 1917 1,700,000, indicating a pop. denser than that of any American republic except Haiti. In 1918 births numbered 49,783, deaths 33,884 and marriages 3,653. Of the births 21,528 were legitimate and 28,255 illegitimate. Most of the upper class are of European descent and reflect European influences; the lower class has a higher standard of living than has that of Nicaragua or Guatemala. The agriculturists are prosperous and alert; few of them are foreigners. Coffee is the principal crop; some 70,000,000 lb. a year are normally exported to the United States, France, Germany, etc. It constitutes 80% of the total exportation. In 1916 there were 153,517 ac. under cultivation, containing 95,000,000 coffee-trees. The 1917 crop was damaged by the great earthquake of June 7, which partly destroyed five towns. Other products are cacao, tobacco, rubber and sugar. Cultivation of cotton and wheat is being encouraged. Corn is extensively raised, because of the domestic demand. Live stock was estimated in 1919 at 284,013 head of cattle, 74,336 horses, 21,457 sheep, and 422,980 hogs. Mine products include gold, silver, iron, copper and mercury. There are native mining companies as well as English and American. The gold output runs about \$1,500,000 per annum.

Foreign trade is in the hands of English, Dutch and German exporters and wholesalers. Its annual value 1912–8 was:—

	Imports	Exports
1912	\$6,714,859	\$ 9,942,184
1913	6,173,545	9,938,724
1914	4,958,024	10,796,495
1915	4,022,167	10,563,871
1916	5,668,000	9,970,000
1917	2,719,093	10,588,900
1918	5,979,000	12,069,000

In 1919 the exports to the United States were \$4,146,113, the imports from the United States \$5,821,920. National revenues and expenditures, in pounds sterling, were reported as follows:—

	1915–6	1916–7	1917–8	1918–9	1919–20
Revenues	£ 850,114	£ 908,325	£ 1,998,810	£ 1,382,644	£ 1,670,056
Exp'd't's	£ 1,058,219	£ 916,704	£ 1,013,842	£ 1,874,079	£ 1,692,692

The estimated revenue for 1920–1 was stated at 14,726,170 colones, and expenditures 16,227,580 colones, leaving a deficit of 1,501,410 colones. The colon was fixed at \$0.50 by law of Sept. 11 1919. Prior to that time it was normally worth \$0.3978, but in 1917 it was worth \$0.60 and by Dec. 31 1918 \$0.72. The national debt at the end of 1918 was \$11,098,000.

Education has long been nominally free and compulsory, but until recently received little attention from the Government. In 1911 there were 173,495 children of school age and only 21,569 in primary schools, which numbered 486; in 1916 only about one-fourth of the 245,251 children of school age were in the 989 primary schools. In the principal towns the schools have done excellent work, though with poor accommodation. In rural districts there were in 1916 only three grades, with a fourth year of industrial instruction added. The lower classes were thus purposely left without educational facilities in order to exclude them from the professions. The secondary schools, of which there are 27, lacked trained teachers and funds, as did the National University. In the latter, graduates of the secondary schools are offered courses in jurisprudence, medicine, pharmacy, dentistry, and engineering. In 1919 a law for eradicating illiteracy was enacted, and a campaign begun to reduce the proportion, then 70%, ignorant of the alphabet. The budget estimate for 1920–1 contained an appropriation of 1,831,374 colones for education. Other social measures were a campaign against alcoholism inaugurated by the Superior Council of Health, and the inception of a federation of working-men's societies.

**History.**—After 1909 Salvador remained substantially at peace within her borders and with her neighbours. President Fernando Figueroa was succeeded by Manuel Enrique Araujo

<sup>1</sup> At that time influenza was raging in the British force.

in 1911, but the latter was murdered in 1913 and succeeded by the vice-president, Carlos Meléndez. He resigned in Aug. 1914. Alfonso Quirón Molina temporarily held the presidential power and when Carlos Meléndez was elected president in 1915, Molina became vice-president. On March 1 1919 Jorge Meléndez was inaugurated for the term ending 1923. The tranquil condition of Salvador was due to the decrease of hostility between Conservatives and Liberals, and to the frequent insistence by the United States upon the preservation of peace.

During the World War Salvador was the only one of the five isthmian republics which did not declare war against Germany, although, by note of Aug. 24 1917, she permitted U.S. vessels, regardless of armaments, to use her ports. When the Monroe Doctrine was adopted without definition in the Covenant of the League of Nations, she interrogated the U.S. Government as to the interpretation of the doctrine; later, in 1920, a movement was made to initiate an international bureau or court excluding the United States from membership, but this movement gave way to another looking toward Central American union, which Salvador had long advocated.

On June 24 1920 the Salvador Department of Foreign Relations sent a circular telegram to the other four isthmian republics inviting their participation in an isthmian congress to review, and, if needful, change the Washington Conventions of 1907, which were intended to safeguard the interests of all Central American countries and to promote the settlement of difficulties through arbitration. The congress was also to plan for unification of the national constitutions and law codes, provision for uniform secondary and professional education, equalization of customs duties with free trade in Central American products, adoption of uniform extradition laws, moneys, weights and measures, and a single coat of arms and flag. From such unification political consolidation was expected to ensue. Conferences began Sept. 15 1920. Nicaragua seemed for a time to prevent complete accord, but a preliminary agreement as to union was reported as having been effected Jan. 21 1921. To this pact of union Salvador, Honduras and Guatemala became signatories; Nicaragua and Costa Rica rejected its terms, which became effective Feb. 10 1922. Salvador has an arbitration treaty with the United States, ratified in 1913, and a treaty encouraging commercial relations, ratified in 1919. (H. I. P.)

**SALVINI, TOMMASO** (1829-1915), Italian actor (see 24.103), died at Florence Dec. 31 1915.

**SALZBURG** (see 24.104), a Territory of Austria, borders for a considerable distance on the Italian Tirol. In 1910 it had 214,737 inhabitants; in 1920 only 213,877 (77 to the sq. mile). In 1900 16.0% of the soil was unproductive. The productive areas included 39.2% forest; 39.8% grazing lands, mostly high-lying; 9.8% meadow; 0.3% gardens; and only 10.8% arable. The most important towns are Salzburg (pop. in 1920, 36,450); Hallein (pop. 6,746); St. Johann, in Pongau (pop. 1,709). The opening of the Tauernbahn has greatly increased the importance of Bad Gastein and Hof Gastein, and the latter has developed into a modern health resort. The Gastein springs are rich in radium.

**SAMSONOV, ALEXANDER** (1859-1914), Russian general, was born in 1859. After being at the Cavalry school in St. Petersburg he served in the war with Turkey in 1877-8. On passing out of the Academy of the General Staff in 1884 he was appointed on the general staff. From 1896 to 1904 he was commandant of the Cavalry school at Elisavetgrad, and in 1902 he was promoted to the rank of general. In the war with Japan in 1904-5 he commanded the Ussuri mounted brigade and the Siberian Cossack division. He distinguished himself greatly as a leader of cavalry, and was awarded the St. George Cross of the fourth class. In 1909 he was made Ataman of the Don Cossacks, and in the same year he became governor-general and commander of troops in Turkestan. In Aug. 1914 he was appointed commander of the II. Army, which was concentrated on the Narev. Sentiments of loyalty to an ally and the desire to take pressure off France at the earliest possible moment led the Russian supreme command to give a premature order for an advance into eastern Prussia. Notwithstanding his

report that his army was not ready for an advance the order was repeated, and as a result of the absence of support from Rennenkampff's I. Army Samsonov's army was destroyed in the battle of Tannenberg on Aug. 26-29. Convinced that the battle was hopelessly lost, he gave orders to his staff to extricate themselves from the German ring, while he went into a wood and shot himself. He was buried, with other Russian soldiers, not far from Villenberg. His wife, coming later to Germany with the Red Cross, recognized his body by a medal that he wore.

**SAMUEL, SIR HERBERT LOUIS** (1870- ), British politician, was born at Liverpool Nov. 6 1870, the son of the banker Edwin Louis Samuel. He was educated at University College school and Balliol College, Oxford, where he took his degree in 1893. In 1895 and 1900 he unsuccessfully contested South Oxfordshire as a Liberal, but in 1902 was elected for the Cleveland division of Yorks. He entered Sir Henry Campbell-Bannerman's Government in 1905 as Parliamentary Under-Secretary to the Home Office. From 1909 to 1910 he was Chancellor of the Duchy of Lancaster, with a seat in the Cabinet, and in 1910 became postmaster-general. He held this office until 1914, and then became for a year president of the Local Government Board. From 1915 to 1916 he was again postmaster-general and Chancellor of the Duchy of Lancaster, and in 1916 became Home Secretary. He acted as chairman of the select committee on national expenditure (1917-8), and in 1919 was a British special commissioner to Belgium. In 1920 he was appointed high commissioner to Palestine and was created G.B.E.

**SANDAY, WILLIAM** (1843-1920), English theological scholar, was born at Holme Pierrepont, Notts., Aug. 1 1843, the son of William Sanday, a well-known breeder of sheep and cattle. He was educated at Repton and Balliol College, Oxford, afterwards becoming a scholar of Corpus Christi. He took a first-class in classical moderations in 1863, a first in the final classical schools in 1865, and was ordained in 1867. He became a fellow and lecturer at Trinity in 1869, and in 1876 was chosen principal of Hatfield Hall, Durham. In 1883 he was appointed Ireland professor of Exegesis at Oxford, and in 1891 Lady Margaret professor of Divinity, a post which he held till 1919. He died at Oxford Sept. 16 1920.

As a theological and biblical critic of the apologetic school Sanday took a very high place. His chief works are *The Authorship and Historical Character of the Fourth Gospel* (1872); *The Gospels in the Second Century* (1876); *The Oracles of God* (1891); *The Early History and Origin of the Doctrine of Biblical Inspiration* (1893); *Commentary on the Epistle to the Romans* (with Dr. Headlam, 1895); *Outlines of the Life of Christ* (1905; a republication of an article in Hastings' *Dictionary of the Bible*); *Christologies, Ancient and Modern* (1910) and *Personality in Christ and in Ourselves* (1911).

**SAN FRANCISCO** (see 24.144) increased in pop. during 1910-20 from 416,912 to 506,676 or 21.05%, making it the eleventh city in the United States. The metropolitan district, as designated by the U.S. Census Bureau in 1920, included all the communities in the extensive area surrounding San Francisco bay. This area had in 1910 a pop. of 750,000 and in 1920 1,121,631, being the fifth population centre of the United States.

*Transportation and Commerce.*—The railway service of San Francisco was greatly improved in the decade 1910-20. In 1917 the Southern Pacific spent approximately \$1,500,000 on yards and carshops in the city. The other railways correspondingly improved their terminal yards on the bay. Steamer service grew remarkably, in part because of the opening of the Panama Canal. In 1911 the ship tonnage of the port was 5,519,556 entered and 5,545,530 cleared. In 1919 4,617 vessels entered the port and 4,696 cleared, carrying a gross tonnage of 12,261,669. In 1920 the 48 steamship lines operating out of the port had over 250 steamers; 29 lines were in foreign and 19 in coastwise trade. The U.S. Shipping Board in allotting ships gave the port 250,000 tons, including seven ships of 21,000 tons each. The urban railway mileage increased from 289.6 m. of single track in 1910 to 352.88 m. in 1920. The opening of a municipal line in Dec. 1912 caused the retention of a five-cent fare. The number of passengers carried during the fiscal year 1919 was 307,000,000 as against 157,722,720 in 1911. The south-western quarter of the city was brought within 25 minutes of the business district by building a tunnel under Twin Peaks (1917). In 1921 the port of San Francisco had 41 modern piers with a total area of 4,500,000 sq. ft., providing for more than 1,200,000 tons of cargo per month, an increase of 100% over the accommodation available in 1910. The Belt railway, which serves all but three of the piers, had in

1920 54 m. of track. A tunnel under Fort Mason, connecting the Government docks and the Presidio with the Belt line, was completed in 1914. The harbour was self-supporting, paying all maintenance, interest and redemption of bonds. In 1911 the people of the state voted \$9,000,000 and in 1914 \$10,000,000 in bonds for port development. In 1920 the harbour board approved plans for an extensive combination dock and warehouse, accessible by ship and rail. The freight discharged and landed over the wharves of the port of San Francisco, exclusive of federal and private wharves, increased from 8,666,148 tons in the year 1910-1 to 10,257,612 tons in 1918-9. The foreign trade of the port in the period 1909-19 increased 274%; while the increase for the United States during the same period was 107%. The value of the foreign trade for 1920 was: exports \$220,257,771, imports \$212,021,768, a total of \$432,279,539. The tonnage movement for the same period was: outgoing 7,033,480, incoming 7,183,942, total 14,216,522.

**Industries and Finance.**—Since 1916 shipbuilding has been the most important industry of San Francisco. In the three-year period 1916-9 there were constructed in the metropolitan district 97 cargo ships of a total of 945,783 tons and 110 naval craft, including three super-dreadnoughts. In 1920 there were completed 68 cargo ships of 607,636 deadweight tons.

In Jan. 1921 the estimated number of factories in the city was 2,500, employing more than 55,000 wage-earners. The principal industries, with the estimated value of their product in 1920, were printing and bookbinding, \$20,000,000; fruit and vegetable canning, \$15,000,000; slaughtering and meat-packing, \$20,000,000; foundry and machine-shop products, \$17,500,000; lumber and timber products, \$7,500,000.

Bank clearings increased from \$2,427,075,543 in 1911 to \$8,122,664,916 in 1920, placing San Francisco eighth in the United States in bank clearings. The assessed valuation of property in 1920 on approximately a 50% basis was \$819,820,078.

**Public Works.**—The plans of the city in 1910 to own its own water supply culminated in the Hetch-Hetchy water and power project. The city owns a watershed of 420,000 ac. in the Sierras on the headwaters of the Tuolumne river, 160 m. distant, from which 400,000,000 gal. of water can be secured daily and 250,000 H.P. produced. The work of development was well under way in Jan. 1921. A railway 68 m. long to Hetch-Hetchy valley and the Lake Eleanor dam were already built, over 18 m. of tunnel were under construction and a hydro-electric plant of 4,000 H.P. was in operation. The contract for the Hetch-Hetchy dam was let for \$5,400,000. Bonds for \$45,000,000 were issued and \$8,000,000 spent by March 1921.

**Buildings and Parks.**—The value of private building operations was \$22,873,942 for 1910, \$18,626,199 for 1915, \$18,644,343 for 1919, and \$32,869,009 for 1920. Among the notable public buildings are those of the Civic Center, located in the heart of the city and surrounded by a plaza. They consist of three main buildings: the city hall, costing \$3,000,000; the auditorium, with a seating capacity of 12,000, given by the Panama-Pacific International Exposition and costing \$1,275,000; and the public library, costing \$1,000,000. A state building costing \$1,000,000 was in Jan. 1921 in process of construction near the Civic Center. Among recent buildings were the First National Bank, American National Bank, Robert Dollar building, Balfour building, Bank of Italy, and the Southern Pacific building. The Exchange building, the building of the California Title Insurance Co., the Crocker building and the Furniture Exchange building were under construction in March 1921. In Jan. 1921 there were 34 parks in San Francisco with an area of approximately 2,500 acres. The Golden Gate Park Memorial Museum had been completed. Nine playgrounds were in use and several more under construction. The public library, as part of the Civic Center, was in 1921 housed in a magnificent building; there were also nine branches and 13 deposit stations with a total of 240,000 volumes, with a home circulation of 1,368,685. The Palace of Fine Arts of the Panama-Pacific International Exposition was given after the fair to the San Francisco Art Association; many of the art treasures shown in 1915 remained there. In Feb. 1921 ground was broken in Lincoln Park for a California Palace of the Legion of Honor as a memorial to the Californians who gave their lives in the World War and as a museum of art.

**Education.**—In 1920 there were 107 public schools, including high schools, with 1,928 teachers and an enrolment of approximately 80,000 pupils. The university of California, at Berkeley, and the Leland Stanford Jr. University, at Palo Alto, each had important teaching departments in San Francisco.

**History.**—The opening of the Panama Canal was celebrated, Feb.-Dec. 1915, by the Panama-Pacific International Exposition at San Francisco, representing an investment of \$50,000,000. The exhibits, numbering about 80,000, were valued at \$300,000,000. Thirty-nine foreign nations and 37 states and three territories of the United States were represented at the exposition. The attendance began with 245,000 on opening day, Feb. 6, rose as high as 348,500 on Nov. 2, San Francisco Day, and reached a total of 1,845,000. The architecture was of a highly varied and monumental character. One of the artistic merits of

the exposition was its effective colour scheme, while the night illumination was extremely ingenious and impressive. In spite of the World War the foreign exhibits were remarkably complete. Financially as well as artistically the exposition was a success. After presenting to the city of San Francisco the auditorium already noted, the exposition authorities had on hand a final net profit of a little more than \$1,000,000. The whole enterprise had been undertaken without Government subsidy; the city and state, however, appropriated \$5,000,000, while private contributors added \$7,500,000 more. Receipts from concessions were \$7,809,565 and from admission fees \$4,715,523. The beginning of a new era in world trade, which the exposition celebrated in connection with the opening of the Panama Canal, was delayed by the World War, but with the resumption of normal conditions trade increased. Following the prosecutions begun in 1907, corruption in the city government was largely eliminated, but it reappeared, though on a smaller scale, after 1909. The election under a new primary system in 1911 of a mayor and city government opposed to "graft" brought in an era of reform. In Dec. 1911, by an extension of the city charter, members of the police and fire departments were placed under civil service. A number of other charter amendments were made during the decade 1910-20, but there was no material enlargement in the power of the city.

(R. A. V.)

**SAN GIULIANO, ANTONINO PATERNO-CASTELLI, MARQUIS DI** (1852-1914), Italian statesman, was born at Catania in 1852, a member of a very ancient and noble Sicilian family. After graduating in law at the university of Catania, he began his public career in the field of local politics and in 1879 was chosen mayor of his native city. In 1882 he was elected to parliament and proved an active worker on committees, speaking frequently and well on foreign and colonial affairs, railway, agricultural, social and fiscal problems. In 1891, as member of the committee of inquiry on Eritrea, he opposed the African policy of both the Crispi and the Rudini Cabinets. When in the following year Sig. Giolitti became premier, the Marquis di San Giuliano was selected as under-secretary for agriculture, while in the Pelloux ministry (1899-1900) he held the portfolio of posts and telegraphs. During the next few years he devoted himself to travel in the near East and in North Africa and to the study of the problems concerning those regions. Having been defeated at the elections of 1904, he was nominated senator; in parliament he had long been a staunch follower of Sig. Sonnino; but when, in Dec. 1905, Sig. Fortis became prime minister, he accepted the post of minister for foreign affairs, and on the fall of the Cabinet early in 1906 he was appointed ambassador in London, where he remained until 1910, gaining much popularity and contributing to render Anglo-Italian relations ever more cordial. He enjoyed the special regard of the late King Edward VII., who afterwards visited him at Catania. From London he was transferred to Paris; but he soon returned to the Consulta as member of the Luzzatti Cabinet (1910-11), and continued at the same post in Sig. Giolitti's administration. In the autumn of 1911 the crisis with Turkey broke out, and it is believed that it was he who convinced the premier of the national necessity for the Italian occupation of Libya. During the whole tenure of office the Marquis di San Giuliano was an ardent believer in the Triple Alliance, on which he thought that Italy's foreign policy should be based, and attached the greatest importance to a good understanding with Austria, an attitude not calculated to win him popularity in many circles; under his guidance consequently Italy opposed Serbia's desire for a port on the Adriatic and Greece's aspirations in Epirus, and supported the policy of creating an independent Albanian State. On Giolitti's resignation in March 1914, San Giuliano retained office under Sig. Salandra, at the latter's urgent request, and was soon faced by the responsibilities arising out of the outbreak of the World War. Public opinion was inclined to attribute the declaration of Italian neutrality to the premier rather than to the minister for foreign affairs. But it is certain that, once the decision had been taken, the Marquis di San Giuliano carried out the policy it involved with the most complete loyalty.

The strain and overwork, however, of the three years of office together with grief at the death of his only son in 1912, had told on his constitution; and after an acute attack of gout, he died in harness at the Consulta on Oct. 16 1914. He was a man of wide literary, historical and artistic culture, a Dante student, and the author of several books and articles on social questions, the conditions of Sicily, foreign affairs, etc.; his *Lettere dall'Albania* are deservedly appreciated, and his geographical studies led to his being elected president of the Italian geographical society.

**SAN MARINO** (see 24.153), area 38 sq.m., had in 1920 a pop. of 12,069. The estimated revenue for the year ending March 31 1921 amounted to 34 million lire, derived mainly from customs; tobacco, matches and salt monopolies; and taxes on patrimonial estates and on urban and rural lands and buildings. There is no public debt. The regents (*Capitani Reggenti*) exercise executive power through four principal committees nominated from the supreme "Council of Twelve," viz.: a *Congresso Economico di Stato, dei Legali, degli Studi and Militare*. A "treaty of good relations and friendship" with the kingdom of Italy, concluded in 1897, was revised and renewed in 1908, 1914 and 1920. The republic has extradition treaties with England, Holland, Belgium and the United States and is represented by Consuls-General at Rome, London and Barcelona and by a *chargé d'affaires* at Paris. England also has an accredited representative resident in Florence. During the World War, though nominally neutral, the republic took a share in providing hospital equipment for the Italian front and put no obstacle in the way of her nationals volunteering for service in the Italian army. San Marino was represented on the International Radio-telegraphic Congress of Basle (1913) and had a wireless station (receiving only) on Monte Titano but, on the entry of Italy into the war, complications arising with Germany, it was dismantled and in 1920 had not been reinstalled.

**SANTAYANA, GEORGE** (1863— ), American philosopher and writer, was born in Madrid, Spain, Dec. 16 1863. At the age of nine he came to America and was educated at Harvard (A.B. 1886; Ph.D. 1889), where he taught from 1889 to 1912 as instructor, assistant professor, and, after 1907, as professor of philosophy. He then retired to devote his time to literary work. In 1905 he was Hyde Lecturer at the Sorbonne. He was a member of the National Institute of Arts and Letters. His chief work is *The Life of Reason; or the Phases of Human Progress* (1905-6), 5 vols., entitled respectively *Reason in Common Sense; Reason in Society; Reason in Religion; Reason in Art and Reason in Science*. His other writings include: *Sonnets and Other Verses* (1894); *Lucifer, a Theological Tragedy* (1899); *Three Philosophical Poets* (1910); *Winds of Doctrine; Studies in Contemporary Opinion* (1913); *Egotism in German Philosophy* (1916) and *Character and Opinion in the United States; with Reminiscences of William James and Josiah Royce, and Academic Life in America* (1920).

**SANTO DOMINGO** (see 24.194).—The decade 1910-20 witnessed a succession of abrupt changes in the political status of Santo Domingo, accompanied by corresponding economic and social developments. The civil security and material well-being ushered in by the Dominican-American Convention of 1907 came to an end with the assassination of President Ramon Caceres on Nov. 19 1911. Gen. Alfredo M. Victoria, the dominant military figure, secured the selection of his uncle Eladio Victoria as president. Revolutionary outbreaks of the traditional type followed, culminating in the appointment of a special commission by the President of the United States, to aid in the reestablishment of peace and order. Conferences resulted in the resignation of Victoria and the election of Archbishop Adolfo A. Nouel as provisional President. Friction developed, and on March 31 1913, Monsignor Nouel resigned and embarked for Europe. The Dominican Congress selected as provisional successor, Gen. José Bordas Baldez. Revolutionary disturbances again broke out and the United States once more lent its good offices by sending a commission, with whose advisory aid Dr. Ramon Baez was selected as provisional president Aug. 27 1914. Some months later Juan Isidro Jiménez was chosen as constitutional president. A brief period of peace and progress ensued, terminated in April 1916 by an outbreak led by

Gen. Desiderio Arias (a chronic revolutionist from Monte Christi), which President Jiménez, aged and infirm, failed to check. Arias seized the military control of the capital, practically deposed Jiménez and assumed the executive power. With another civil war thus imminent, with its patience strained by the events of the preceding years, and with the international situation developed by the World War threatening foreign intervention, the United States now took definite action. Naval forces were landed. President Jiménez resigned the presidency and retired to Porto Rico, and in May-June 1916 the pacification of the country was effected with nothing more serious than minor encounters with revolutionary forces. On July 25 1916, the Dominican Congress selected Dr. Francisco Henriquez Carvajal as temporary president. The United States, refusing recognition until assured of the non-recurrence of civil disorder, proposed a new treaty based upon the convention just adopted between the United States and Haiti (see HAITI), which should repair the shortcomings of the 1907 convention in providing for the collection of customs under American auspices, the appointment of an American financial adviser and the establishment of a constabulary force officered by Americans. President Henriquez refused to enter into this arrangement, with a resultant deadlock intensified by the withholding by the American authorities of the revenues collected by its officers. Matters came to a head with Henriquez's intention not to retire from the presidency upon the expiration of his provisional term but to present himself as a probable successful candidate for popular election. On Nov. 29 1916 by proclamation of the American commander of the forces of occupation, Santo Domingo was placed under the military administration of the United States. Executive departments were taken over by American naval officers, ex-president Henriquez left the country, order was quickly established, and Santo Domingo entered upon four years of civil quiet and economic improvement. The termination of this status was foreshadowed Dec. 24 1920 by a proclamation of the military government that "the time has arrived when it may, with a due sense of its responsibility to the people of the Dominican Republic, inaugurate the simple processes of its rapid withdrawal from the responsibilities assumed in connexion with Dominican affairs." Announcement was made that a commission of representative Dominicans with a technical adviser was to be appointed, entrusted with the formulation of constitutional amendments and the revision of the laws of the republic, such proposals upon approval of the military governor to be submitted to a constitutional convention and to the national congress.

The economic experience of the country in the decade reflected closely the successive political changes outlined above. Agriculture continued the mainstay of the country's life; and cacao, sugar and tobacco leaf remained its staple crops. Increased production in the years following the convention of 1907 showed arrest in 1912-4 changing to abrupt increase in 1915. With the war-induced rise in prices and the conditions born of military occupation, the upward movement in export values continued through 1920, assuming sensational proportions in the last-named year. The combined volume of imports and exports was less in 1914 than in 1911; but the increase in 1915 over 1914 was greater than the total exports in 1905, and the increase in 1916 over 1915 was almost as much as the combined exports and imports of 1905. The combined value of imports and exports was \$105,257,117 in 1920, as compared with \$61,621,019 in 1919 and \$17,945,208, in 1911. An increasing proportion of this trade has been with the United States, 77.17 % of imports and 87.03 % of exports in 1919, as compared with 59.29 and 52.31 % respectively, in 1911. In the first half of the decade political disturbances delayed the course of financial extrication ensured by the convention of 1907; but after 1916 rapid progress was made. On Dec. 31 1920, the sinking fund established for the \$20,000,000 U.S. customs administration loan amounted to \$11,457,373, ensuring amortization long before maturity. A loan of \$1,500,000 authorized by the United States to discharge internal debts contracted in 1911-2 was finally liquidated in 1917. A further issue of \$4,000,000 authorized in 1918 to liquidate and fund all outstanding internal indebtedness, as adjusted by a claims commission appointed by the military government, will be paid off by Dec. 31 1922. Economic and social conditions, although suffering from the political agitation prior to 1916, remained throughout far above the preconvention state. Since the military administration progress was notable. Roads and bridges were built, schools established, public sanitation extended, steps taken to clear up the complicated land title situation, internal taxation made effective and competence and regularity introduced in administrative service. Whether this was achieved at the expense of weakened capacity for

self-government may be doubted. The policy of the United States was to make evident to the best elements in Santo Domingo what honesty and efficiency in administration could accomplish, as well as the futility and cost of "government by revolution."

The military government of Santo Domingo completed in 1921 the first census ever taken of the republic, and reported the number of inhabitants as 897,405. The population is scattered chiefly in a fringe along the shore and in the Cibao Valley especially in the region thereof known as the Royal Plain. In the mountainous interiors are vast uninhabited stretches and valleys which have not been visited since the days of the Conquest.

See Otto Schoenrich, *Santo Domingo: A Country with a Future* (1918); Report of Military Governor on Conditions in Santo Domingo, in *Annual Report of Secretary of the Navy* (1920). (J. H. Ho.)

**SARGENT, JOHN SINGER** (1856— ), Anglo-American artist (see 24.219), exhibited in 1910 the open-air paintings "Albanian Olive Gatherers," "Glacier Streams," "A Garden at Corfu" and "Vespers." In 1911 appeared "A Waterfall" and "The Loggia." His portrait of Henry James was exhibited in 1914, and was one of the pictures damaged in that year by suffragette attacks. He contributed in 1915 a blank canvas to a Red Cross sale at Christie's, which was secured by Sir Hugh Lane just before his death for £10,000. In Dec. 1916 the third series of his mural decorations in the Boston Public Library was unveiled. This concluding series is entitled "The Theme of the Madonna." The first series (1895) depicts "The Judaic Development"; the second (1903), "The Dogma of the Redemption." The theme of the whole is "Judaism and Christianity." In 1917 he was elected a trustee of the Tate Gallery. During the World War he made a number of paintings of scenes on the western front; and his large picture "Gassed" in the Royal Academy in 1919 attracted great attention. In Nov. 1921 his decorations in the rotunda of the Boston Museum of Fine Arts were unveiled.

**SARRAIL, MAURICE PAUL EMMANUEL** (1856— ), French General, was born at Carcassonne (Aude) April 6 1856. He qualified for both St. Cyr, and the École Polytechnique but chose to enter the former. He passed out Oct. 1 1877 with the distinction of third place and was posted as a sub-lieutenant to the infantry. His regimental service and promotion followed the normal course; he became lieutenant Oct. 1882, captain in 1887, and *chef-de-bataillon* in 1897. In 1901 he was appointed Commandant of the École Militaire d'Infanterie (St. Maixent), and the following year was promoted lieutenant-colonel. From 1904 to 1906 he held the appointment of Military Commandant of the Palais Bourbon, being made colonel in 1905. In 1907 he became Director of Infantry at the War Office—an appointment which he held 4 years. He was made general-of-brigade in 1908. Three years later he was promoted general-of-division and on Nov. 1 1913 was given command of the VIII. Army Corps, being later (April 24 1914) transferred to the VI. Corps, which he commanded on the outbreak of the World War. But though General Sarrail's military capacity was recognized prior to 1914 it was principally by his semi-political activities that he was best known; and as a member of General André's military cabinet he played a conspicuous part during a very troubled period of French army history. On Sept. 2 1914, after commanding the VI. Corps with credit in the Battle of the Frontiers, he was appointed to succeed Ruffey as commander of the III. Army. This army formed the pivot of the wheel-back of the Allied forces during the retreat to the Marne, and Sarrail maintained it as such on the N.W. front of Verdun, although authorized and indeed ordered to fall back. This left him in an exposed position, but one in which the swinging-in enemy himself might present a flank to Sarrail's attack. His part in bringing about the situation which enabled Joffre to counter-attack was thus as important and as brilliant as Gallieni's on the other flank. During the trench-warfare operations of 1914-15, however, he was less successful, as he was essentially a leader of temperament, and growing friction with Joffre led to his dismissal from this command after the action of Bourdeilles. Almost immediately thereafter, under circumstances described in the article SALONIKA CAMPAIGNS, Sarrail was appointed Commander of the French Army of the East, and at a later date he became commander-in-chief of the Allied forces on that front. The troubled history

of this command, which lasted till his recall in Dec. 1917, is told in the article referred to. After his return to France he saw no further active service. In April 1918 he was placed on the reserve on reaching the age limit. He became a Grand Officer of the Legion of Honour in Nov. 1914 and was awarded a Grand Cross of the same Order in Jan. 1916. He was given the Médaille Militaire in Sept. 1917. Soon after the end of the war he published his account of the Salonika operations under the title *Mon Commandement en Orient*.

**SASKATCHEWAN** (see 24.225).—This Canadian province includes 243,382 sq. m. of land area and 8,318 sq. m. of water; 257,700 sq. m. in all. Its southern boundary is the 49th parallel and its northern the 60th: it is 390 m. from E. to W. and 760 m. from N. to S. The province comprises portions of the old districts of Assiniboia, Saskatchewan and Athabasca, which formed part of the old North-West Territories, with the town of Regina as the capital and the residence of the lieutenant-governor.

The province may be divided into four more or less well-defined zones. (1) The prairie zone forms the most southerly portion, extending from the U.S. boundary as far N. as the town of Saskatoon, and marked by open rolling prairie country of the richest possible agricultural character. (2) The prairie and woodland zone extends from Saskatoon to the southern edge of the great northern forest, consisting of mixed prairie country and woodland adapted for farming and stock-raising. (3) A dense forest zone is bounded on the S. by a line passing from the Swan river in a N.W. direction near the town of Prince Albert, and on the N. by a line drawn from the northern part of Reindeer lake to the southern part of Lake Athabasca. This zone is well watered and well timbered, being covered with a forest growth of spruce, tamarack, jack pine, poplar and birch. (4) The sparsely wooded forest zone includes the remainder of the country northward.

The geology of Saskatchewan is simple. Formations of very ancient, highly crystalline, contorted and isolated or schistose rocks, together with metamorphic rocks and eruptives, form a floor or basement complex referable to the Laurentian and Huronian systems, and upon this floor of primitive rocks there rests unconformably an uninterrupted succession of evenly bedded and for the most part stratified sedimentary formations ranging from the Keweenaw of supposed Cambrian age, through the paleozoic and mesozoic, to the Tertiary and Quaternary ages inclusive.

The province has an elevation of from 1,500 to 3,000 ft. above sea-level, which accounts for the dryness and clearness of the atmosphere. As in southern Alberta, portions of the country need irrigation, and the requirements of water and the sources of supply are problems being dealt with by the several governments interested.

The following table shows the growth of pop. since 1901:—

	Male	Female	Total
1901	49,431	41,848	91,279
1906	152,791	104,972	257,763
1911	291,730	202,702	494,432
1916	363,787	284,048	647,835

In 1916 the urban and rural pops. were 176,297 and 471,538 respectively. The census showed 159,292 families with an average of 4.31 persons per family housed in 140,359 dwellings. The origins were: Canadian-born 352,920; English 90,435; Irish 62,551; Scotch 64,735; Welsh 1,451; French 24,011; German 34,091; Austro-Hungarian 24,195; Scandinavian 13,064; Dutch 5,448; Indian 10,736; Polish 2,559; Russian 11,623; Ukrainian 2,175; others 8,806. The U.S. immigrants of various nationalities born in the United States were 87,907; of these 46% were British descendants. There is a largish community of Russian Doukhobors. The Indians of Saskatchewan are chiefly plain or wood Crees, with a mixture among them of Saulteaux. Towards the S. small bands of Assiniboines are found, and here and there small companies of refugee Sioux from the United States. They number 10,736 and are all on Government reserves. Steady progress had been made in enabling the Indians to become self-supporting, and to live in comfortable houses, growing crops of grain, making hay and possessing herds of cattle. At the various industrial schools young Indians, both male and female, receive a practical education.

Regina, on the main line of the C.P.R., is the capital, and had in 1920 a pop. estimated at 27,000. It was formerly the headquarters of the Royal Northwest Mounted Police. It contains the provincial legislature buildings, one of the provincial normal schools and the Regina College.

**Moose Jaw** (estimated pop. in 1920, 17,000) is situated on the main line of the C.P.R. It has extensive stock-yards and flour-mills, also a storage elevator with a capacity of about 3,500,000 bushels.

**Prince Albert**, on the banks of the North Saskatchewan (pop. in 1920 about 7,000), bids fair to become a manufacturing centre. It contains large sawmills and flour-mills, and is the centre for the fur-trading industry.

**Saskatoon** (pop. 1920, 22,000) has been one of the rapid urban growths of the Middle West. It is an important railway and distributing centre, through which the C.P.R. and two Canadian National railways pass. Tributary to the town is a large area of arable and prairie land.

North Battleford, Swift Current, Weyburn, Battleford, Maple Creek, Melville, Estevan, Yorkton, Humboldt, Indian Head, Moosomin, Qu'Appelle, Kamsack, Rosthern and Wolseley are local centres, deriving their importance chiefly from their situation in the midst of rich agricultural districts.

The executive Council of Saskatchewan consists of 7 members and the Legislative Assembly of 62 members. The province is represented in the Federal Parliament by 16 members of the House of Commons and 6 senators.

Education, both primary and secondary, receives earnest attention from the Government. The schools are free and supported by the Government and local taxation. Collegiate institutes and high schools are found in every important centre. Normal schools for the training of teachers are maintained at Regina and Saskatoon. The university of Saskatchewan at Saskatoon is supported and controlled by the province. In connexion with it is the agricultural college, which is well equipped for its special purpose and conducts very practical work among the farmers of the province. Saskatchewan schools in 1918 numbered 3,941 and maintained 6,662 teachers. The total enrolment in that year was 147,232, and the entire cost of administration \$9,110,925 (in 1906 it was \$1,465,361).

The province is essentially agricultural. The soil, made up of the detritus or debris of a great variety of rock materials and rich in natural phosphates, is characterized by its ability to produce a high average yield of wheat, oats, barley and potatoes for many years in succession without the application of artificial fertilizers. From experiments carried on at Indian Head—the headquarters of the experimental farm subsidized by the Dominion Government—it has been ascertained that the high average yields of wheat, oats, barley and potatoes on that farm are not only maintained from year to year, but are actually larger than at any of the other Dominion experimental farms scattered throughout Canada.

Saskatchewan has probably the greatest possibilities of production of all the provinces in the Dominion. Of the land area of 243,382 sq. m. a little over 25,000 were under crop in 1918, and it is estimated that, apart from forest land requiring clearing, 112,000 sq. m. are suitable for agriculture. In its southern parts the returns equal those of Manitoba, which have been regarded as exceptional. On the average of 1915-7 the yield was 163,264,100 bus. of wheat at a total value of \$207,599,833. The limited area under cultivation yields a grain crop exceeding 350,000,000 bus. in a single year. The following are yields and values for the year 1920: wheat 113,387,300 bus., value \$175,700,000; oats 141,590,000 bus., value \$58,035,000; barley 10,501,000 bus., value \$6,931,000; rye 2,535,000 bus., value \$3,194,000; mixed grains 615,000 bus., value \$769,000; flax-seed 5,705,000 bus., value \$10,383,000; potatoes 6,861,000 bus., value \$8,576,000; turnips, etc., 3,145,000 bus., value \$2,956,000; hay and clover 328,300 tons, value \$3,283,000.

With the exception of wheat and oats, the field crops are mainly grown for home consumption in stock-raising. The erection of silos in connexion with well-appointed farm buildings indicates the improvement of methods and the growing prosperity of farmers. The cattle industry of Saskatchewan has reached a very important place. There are many large herds scattered throughout the province, subsisting for a large portion of the year on native grasses and for the remainder of the year—the winter months—on outdoor feeding. So rapidly has the cattle industry advanced in the past few years that it has been found necessary to establish large stock-yards at Prince Albert and Moose Jaw. Dairying, naturally associated with the cattle industry, is making rapid progress, and at important points in the province are established up-to-date creameries. The output of dairy and creamery butter for one year amounted to 19,368,668 lbs., valued at \$6,192,213, to which is to be added milk and cream to the value of \$7,450,000, or a total of \$13,642,213. In 1907 there were only four creameries in operation with 213 patrons, and in 1920 there were 20 creameries with 7,500 patrons and in addition four cold-storage plants. The raising of sheep has become general throughout the province, particularly in the northern part, where the conditions are most favourable.

The lumbering district of Saskatchewan lies N. of Prince Albert. Trees consist mainly of spruce, larch, jack pine, white and black poplar and white birch. Much of the timber is used for railway ties,

and the recent annual cut amounted in value to about \$2,000,000 a year. In the northern section of the province the Dominion Government set aside a number of large areas as forest reserves. The forests of the north still abound in fur-bearing animals, the principal being bear, otter, beaver, marten, wolf and mink. Prince Albert and Battleford are local centres of the fur trade, the annual value of which is about \$1,450,000.

Manufacturing industries are not yet important in Saskatchewan. There are a number of flour-mills throughout the province, and the making of cement and bricks is coming more and more into prominence. Coal-mining, however, promises to be the principal industry of the province. Mining has been carried on, for several years in the vicinity of Estevan. The lignite deposits of Saskatchewan, which underlie an area of 7,500 sq. m. and are estimated to contain 200,000,000 tons of lignite coal, were in 1920 being experimented with by processes of carbonization and briquetting. Gold, silver, copper, cobalt, iron, mica, peat, pigments, ochres and natural gas are among the mineral resources of the province. The value of minerals raised in 1919 was \$1,118,955. The fisheries of Saskatchewan are still in their infancy. The lakes and rivers of northern and central Saskatchewan abound in fish sufficient to supply millions of people. The value of the fisheries in 1919 was \$475,797.

For more than 30 years up to 1921 the main line of the C.P.R. had crossed the province of Saskatchewan from E. to W., about 100 m. N. of the border of the United States. One of its most important branches is the "Soo" line from Moose Jaw to St. Paul, Minn. Its lines to Edmonton and Lacombe, Alberta, have daily increasing traffic and passenger service. The main lines of the Canadian National railways also cross the province, with many branches tapping its rich agricultural districts. Saskatchewan has now over 6,000 m. of railway. The province is so well served by the C.P.R. and the Canadian National railways, with their numerous branches, that few of the established settlements are more than 10 to 20 m. from a means of transport. The Hudson Bay railway when completed will afford a short haul to ocean shipping from the Saskatchewan grain-fields. The building of roads and bridges within the province has been taken up energetically by the Government, and large sums have been expended. (W. L. G. \*)

**SAVAGE, MINOT JUDSON** (1841-1918), American divine and author (see 24,239), died in Boston, Mass., May 22 1918.

**SAVINGS MOVEMENT.**—The origin and development of what became known in England as the "War Savings Movement" provides the subject-matter of one of the most interesting chapters in the economic history of the World War. In the United States, to which reference is made in a subsequent section, the Savings and Economy movement was no less remarkable.

#### UNITED KINGDOM

Institutions for the normal encouragement of thrift on the part of the people of the United Kingdom were making steady progress up to the date of the outbreak of the war in 1914. From that date onwards the pace of their advance was materially accelerated. The amount due to depositors in the Post Office Savings Bank increased 28% in the decade 1903-13, while during the five years 1913-8 they increased by 42%. The amount due to depositors in the Trustee Savings Banks increased 3.2% in the decade 1903-13, while during the years 1913-20 it increased by 12.5%. These figures give a general indication of the growth of the savings of the people during the war period, but they do not tell the whole story. In the atmosphere created by the War Savings movement, and in the circumstances which for a time materially improved the financial position of the wage-earning classes, not only did existing savings institutions develop rapidly, but a new national thrift machinery was brought into being and its operations met with remarkable success.

**Cost of the World War.**—Within six months of the outbreak of hostilities in Aug. 1914, it became evident to those who were more closely in touch with realities that the World War would be a prolonged struggle, in which it would be necessary for the combatant nations to marshal their entire resources for production. Modern warfare was seen to demand not only that there should be a high percentage of the population in the fighting forces, but also large numbers of civilians producing on a huge scale military equipment of the most varied character. The enormous volume of goods and services which had to be requisitioned is best expressed in terms of the national expenditure. The largest amount spent by Great Britain in war in a single year before 1914 was £71,000,000. The Revolutionary and Napoleonic wars cost in the aggregate £831,000,000 spread

over 20 years, an average annual expenditure of £42,000,000; the Crimean War cost £675,000,000 in three financial years, or an average annual expenditure of £225,000,000, while the S. African War of 1899-1902 cost £211,000,000 spread over four years. In the face of the expenditure during the World War of 1914-9, these figures are insignificant. The money spent by the Government of Great Britain during the five financial years cannot be placed at less than from £8,000,000,000 to £9,000,000,000. At one period the average daily expenditure rose to the enormous figure of nearly £7,000,000 sterling.

It was not, however, till the year 1915 was well advanced that the full meaning of the cost of the World War in terms of goods and services began to be appreciated, even by those in high places. During the first few months of the war the inevitable dislocation of industry caused by the calling-up of men of military age and the interference with the normal markets led to a considerable amount of unemployment, and steps were taken by the Government and by the public for the relief of distress. This period of unemployment lasted but a short time and far less distress was caused than had been anticipated. The increased demand for men for the fighting forces and the rapid organization of special war work in many directions quickly absorbed the unemployed. Women were drafted into industry in ever-increasing numbers. In the meantime, the normal production of goods was reduced and stocks diminished. Prices rose rapidly owing to the excess of demand over supply and wages were raised sympathetically. Gradually a large amount of overtime became general, and, in many instances, owing to several members of the same family being in receipt of good wages and on account of overtime, the incomes of working-class families reached very substantial figures. By the summer of 1915 the purchasing power of the people of the country had been very considerably increased.

With the increased demand for goods which followed this rise of the purchasing power of the masses, prices mounted still higher; and with the growth of credit, which was required to cover the increased payments of wages, a dangerous situation was created. By the middle of 1915 it was obvious that it was of paramount importance that the personal expenditure of the people of the country should be checked, and that, in fact, the stopping of individual expenditure was quite as important as the raising of money for the war. It was seen that while from the financial point of view it was desirable that the expenditure on the war should be covered as far as possible by monies raised by taxation, and next by loans from money saved by the people of the country, it was equally important that the mass of the people should reduce their personal expenditure in order to release the resources of the country in capital and labour for the production of the essentials of war. The military advisers of the nation were calling for still larger numbers of men for the fighting forces. Recruiting became more and more urgent. The war factories were crying out for tens of thousands of hands for the production of the vast stores needed on all the fighting fronts. At the same time, the demand of the people through their daily expenditure, stimulated by high wages and big incomes, was automatically retaining labour in the production of things which were not only not necessary for their subsistence, but were often mere luxuries. Again, the expenditure of individuals tended to increase the purchase of imported goods, necessitating either increased exports demanding labour for their production, or adversely affecting the Exchanges and necessitating the export of gold or the sale of foreign securities. The real difficulty of the situation was seen to be the scarcity of human labour to produce the necessities of war rather than the finding of money to pay for them. Thus the exigencies of the recruiting agencies and national factories led directly to the "goods and services" point of view and to an imperative demand for personal saving.

The dangers of the situation were emphasized by Mr. Lloyd George in May 1915, and it soon became evident that drastic steps would have to be taken to enforce economy throughout all ranks of the community and particularly among the wage-earners, whose aggregate purchasing power had reached dimen-

sions which made their personal expenditure the largest factor in the situation.

*Early Efforts for Saving.*—During the autumn of 1915, a vigorous mission was undertaken by a voluntary body known as the United Workers, who by the holding of lectures and meetings throughout the country did much to explain the facts to the people and prepared the ground for more concentrated effort later. About the same date a Parliamentary War Savings Committee was established, and through its efforts local war thrift committees were set up in a number of the larger towns of the country. All these efforts were, however, to a large extent ineffective, owing to the absence of any form of investment security specially adapted for persons of small means. The machinery of the Post Office Savings Bank and the Trustee Savings Banks, allowing for deposits at low interest, was inadequate to cope with the situation.

The history of the Post Office Savings Bank during the first year of the war fairly accurately indicates the trend of events. The outbreak of the war saw a sharp run on the Post Office Savings Bank deposits, a run accentuated by the actual shortage of coinage which persisted even up to the end of August. The net withdrawals from the Post Office Savings Bank Department from the declaration of war to the end of Aug. were £2,500,000 in excess of deposits. After Aug. 1914 confidence was quickly restored and deposits began to come in freely. Before the end of Sept. they had exceeded the withdrawals, and so completely did the tide turn that the deposits for the three months ended April 30 1915 exceeded the withdrawals by £4,400,000, or were £3,000,000 in excess of deposits in the corresponding quarter of 1914. For the five months from Jan. 1 1915 to May 31 1915, the balance due to depositors increased by over £6,500,000 as compared with an increase of £1,700,000 during the corresponding period of 1914.

Good as these results were in themselves, it became, however, increasingly clear that the Post Office Savings Bank alone, with the rate of interest on deposits at 2½%, was not sufficient to stimulate saving in the country to the extent that was necessary. Several times pressure was brought to bear on the Government with a view to getting the interest on the savings bank deposits increased, but this pressure was resisted. Other small attempts were made to attract saving. During the issue of the 4½% War Loan in June 1915, scrip vouchers of 5s. and 10s. and scrip certificates of £1 and £5 were issued by the Post Office. The scrip vouchers, when they amounted to £5 or a multiple of £5, and the scrip certificates could be exchanged at any money order post-office during the first fortnight of Dec. 1915, the owner being duly registered as a holder of a corresponding amount of War Loan and being given a stock certificate. Interest was allowed on the scrip vouchers according to the month of purchase and provision was made for repurchase by the Post Office at face value of any vouchers in excess of the £5 multiple. The aggregate result was that, between Nov. 1915 and Dec. 1920, scrip certificates amounting to £3,967,965 and scrip vouchers amounting to £1,049,838 were exchanged for 4½% or 5% War Loan or Exchequer bonds. The £5 scrip certificates were only exchangeable for 4½% War Loan, but the scrip vouchers could be held for subsequent loans. These were the chief official steps taken to facilitate saving by the people up to the end of 1915. In Nov. of that year the Government was pressed to increase the maximum sum which depositors might pay into the Post Office Savings Bank in any one year, but it was pointed out that this would require fresh legislation, the existing limits having been fixed by the Savings Bank Acts of 1891 and 1893.

Expression had been given to the need for action in a letter to *The Times* in the summer of 1915 from "A Banker."<sup>1</sup> The force of his contentions was widely recognized, and this letter may be regarded as the germ from which the War Savings movement was started. This was followed by an important manifesto signed by some of the foremost men in the world of business published in *The Times* in November. It was a straight-

<sup>1</sup> The author was Mr. R. H. Brand, a partner in the London firm of Lazards, and a well-known writer on finance. (H. CH.)

forward statement calling the nation to thrift and urging concentration on the production of essentials only, eschewing non-essentials by universal personal economy.

*Montagu Report.*—Finally, in Dec. 1915, the Chancellor of the Exchequer (Mr. R. McKenna) set up a Committee under the chairmanship of the financial secretary to the Treasury (Mr. E. S. Montagu) to consider the question of getting contributions to War Loans from the working-classes. The final report of this Committee (Cd. 8179), dated Jan. 26 1916, marked the birth of the War Savings movement as a national organization.

An interim report had been issued on Dec. 28 1915, recommending the removal for the period of the war and six months after of the restrictions which limited the amount deposited by any one depositor in the Post Office and Trustee Savings Banks to £50 in any one year and £200 in all. The Committee also recommended that Exchequer bonds of the denominations of £5, £20 and £50 should be placed on sale at all post-offices, provision being made for the deposit of the bonds at the post-office and the issue of books in which the deposit of the bonds would be recorded. The Chancellor of the Exchequer recommended the adoption of these proposals and they were concurred in by a Treasury minute of the same date. Two series of bonds, with interest at the rate of 5% per annum and 6% per annum respectively, were on sale in 1916 and brought into the Exchequer nearly £44,000,000.

The final report of the Committee pointed out that there were two separate objects to be attained by the successful solution of the problem of the small investor: (a) the reduction of general consumption, which would tend to check the rise in prices; and (b) the raising of a certain amount of money for the prosecution of the war. The needs of the small investor were described as being: (a) a simple method of investing savings; (b) a guarantee that the capital value of the investment will not depreciate; (c) the ability to withdraw savings at short notice, and (d) the knowledge that as high a rate of interest is paid on the money of the small investor as on that of the large. It was further pointed out that both propaganda and organization were essential to success in making any appeal for savings. The report recommended the appointment of two committees—one to carry on propaganda and to establish on a large scale voluntary War Savings associations for coöperative saving, and the second to devise and approve various schemes of saving and to safeguard their financial soundness. In order to meet the needs of the small investor the Committee recommended the issue of a new form of Government security in the shape of "War Savings Deposits" of 15s. 6d. each, each deposit entitling the subscriber to receive £1 on the fifth anniversary of the date of the deposit.

*National War Savings Committees.*—The Chancellor of the Exchequer adopted the recommendations, and on Feb. 8 1916 the two committees were appointed. (These two committees were amalgamated in the following April under the title of the "National War Savings Committee," separate committees being established for Scotland and Ireland.)

*War Savings Certificates.*—On Feb. 19 1916, the projected savings deposits were issued under the revised title of "War Savings Certificates." The War Savings certificate must rank as one of the most ingenious and successful financial instruments ever conceived. For the first time in history a security was offered to the people which by its nature tended to concentrate the mind on the growth of capital value through the accumulation of interest, rather than on the annual return in the form of dividends. This feature of the "small investor's Treasury bill," as it has been called, has had, undoubtedly, a far-reaching psychological effect. It may be said to have projected the mind of the investor towards an ultimate personal use of the accumulated proceeds of his investment after a considerable term of years, and to have reduced the motive of investment merely as a means of providing an annual sum to be spent on its arrival. To the intrinsic merits of the certificate the success of the War Savings movement is, to a great extent, attributable. The certificates were purchasable for 15s. 6d. and could be cashed at

any time. At the end of 12 months a certificate could be cashed for 15s. 9d. After this period its cash value increased by a penny a month, and at the end of five years it could be cashed for £1; that is to say, an additional 3d. was added to the value at the end of the fifth year beyond the increase of a penny a month. Subsequently, by Section 4 of the War Loans Act, 1919, the life of the certificates issued, or to be issued, was automatically increased to ten years, the value of the certificates rising after the end of the fifth year by a penny a month until the end of the tenth year, when a further 1s. would be added, making the final encashment value 26s. By the Finance Act, 1918, Section 41, and the War Loans Act, 1919, Section 4, it was provided that the encashment of certificates held by any individual owner could be postponed beyond the period of maturity until the maturity of the last-dated certificate in his possession, such certificates held over increasing in value at a flat rate of a penny a month. Section 42 of the Finance Act, 1916, provided that the accumulated interest payable in respect to any War Savings certificate issued by the Treasury through the Post Office, under which the purchaser by virtue of an immediate payment of 15s. 6d. became entitled after five years to receive the sum of £1, should not be liable to income tax so long as the amount of the certificates held by the purchaser did not exceed the amount for the time being authorized to be held under regulations made by the Treasury. To avoid the serious consequences which would result to the revenue if income taxpayers generally were to use this form of investment, it was originally arranged to confine the issue of War Savings certificates to persons whose total income from all sources did not exceed £300 a year. Experience, however, showed this limitation to be undesirable. The necessity for a declaration as to income at the time of the purchase of the certificates caused administrative difficulties, and by reason of the income limit many wage-earners who were temporarily drawing large wages were unable to buy certificates. In view of these facts, the Committee recommended the Treasury to abolish the income limit, and the restriction was removed on June 10 1916. All formalities in regard to deduction and recovery, proof of exemption or title to abatement from income tax were dispensed with, and a limit of 500 certificates was put on the number allowed to be held by any one person.

By the Finance Act of 1918, it was provided that if a person's holding was brought by inheritance above 500 £1 certificates or their equivalent, the excess might be held without liability to any penalty or to income tax, so long as the person did not purchase for his own benefit, or have purchased for him, any further certificates while holding more than 500 certificates in all.

The War Savings certificate was ingenious not only from the financial standpoint, but also in its form. The certificates were issued in books, upon the cover of which the name of the holder and his address had to be inscribed. The book was of no value except to the person whose name was written upon it. The certificate contained a small panel on its right-hand side, to which the receipt for the purchase price had to be affixed, and the certificate was not valid until this had been done. The receipt was printed on green paper, and each receipt had a number which became the official number of the certificate. The certificate was registered at the money order department of the Post Office as belonging to the particular individual in whose name it was issued. It was necessary to have the signature of the owner to prevent the certificate being cashed by any unauthorized person. In order to provide for this, the receipt which was affixed to the certificate was only the left-hand portion of an original form of receipt, while the right-hand portion, having upon it the corresponding number, had to be filled in by the applicant and handed back to the postmaster. This portion contained the full name and address and signature of the purchaser and formed the basis of the registration system. When the certificate was cashed at a later date, the number on the certificate and the signature of the applicant on the request for repayment could be compared with that portion of the receipt which had been filed. Certificates might be bought by one person on behalf, and in the name of, another person, the signature of the beneficial owner being, if possible, supplied. A cut-out signature from a letter or other document was accepted, but if a signature was not available, it was obtained later by the Post Office. In the case of children under seven years of age the signature was not required. After the receipt had been stuck in the certificate book and a certificate had thus been completed, it could only be transferred to another person in exceptional circumstances and by permission of the Postmaster-

General. A fee of 1s. was charged in respect to each transferee. Certificates were not negotiable, and their value would not be paid to anyone but the holder whose signature was registered by the Post Office. Holders over 16 years of age could make nominations of their holdings in case of death. Every nomination had to be on a proper form, which could be obtained from the Controller of the money order department, and required to be received by the Controller during the lifetime of the holder. In addition to the receipts for the payment for single certificates costing 15s. 6d., each of which was stuck into a certificate book, single documents representing 12 or 25 certificates could be obtained from any money order post-office and most banks. These consisted of two parts divided by a perforation, the left-hand part for registration, and the right-hand portion to be retained by the purchaser. Books were not supplied for these certificates. Documents were also issued for any number of certificates from 26 to 500, both inclusive. These were not kept at local post-offices, but were issued by the Controller and Accountant General of the Post Office, to whom application with remittance was made direct or through a bank. They were applied for on a special form and issued a day or two after receipt of the application. If a certificate, or book of certificates, were lost, a new certificate, or book of certificates, would be issued at a charge of 1s., provided the serial numbers could be furnished to the Controller of the money order department.

On Dec. 4 1920, the old print of War Savings certificates was withdrawn from sale at post-offices and banks, and on Dec. 6 "National Savings" certificates were substituted. The change was legalized by the Savings Bank Act of 1920, and was one of title only. The conditions attaching to the old certificates still applied.

The savings certificate formed the basis of the operations of the War Savings associations, which were established under the auspices of local War Savings committees and affiliated to the National War Savings Committee.

*War Savings Associations.*—Not less important than the War Savings certificate was the system of association, or club, proposed by the Montagu Committee. In their final report the Committee pointed out that the would-be investor should not, if it could be avoided, be left to himself to seek for an investment. Facilities for investment should be provided by agencies in close touch with him; and these agencies, having succeeded in inducing him to save, should endeavour by careful propaganda and by thorough organization to persuade him to make the continuance of saving a matter of habit. The Committee emphasized the advantages of placing an agency between the small investor and the State which could collect and manage the savings of the small investor. It was pointed out that the Government could enter into no contractual relationship with the individual investor, unless it assumed complete control over the schemes adopted and also supervised in detail the actual administration of the societies themselves. They added that the organization of such control and supervision would require the creation of a new Government department, which, apart from the question of the expense involved, it would have been impossible to staff during the war. Also, the rigidity of procedure which a State system would inevitably involve would be fatal to the free local initiative on which the success of such a scheme would depend. At the same time, if societies, many of which have at their command no expert financial knowledge, were left free to develop schemes without supervision or control, some of them would not unlikely become insolvent. The problem was to obtain the best safeguards which could be secured for the financial soundness and efficient administration of the different schemes, while leaving the responsibility for both administration and results with the societies themselves, and they recommended that the committee which should be appointed by the Government, and to which the various investment societies might be affiliated, should be regarded, not as representing the Government, but as an independent body of experts acting on behalf of the societies themselves. Its duties would be primarily of an advisory character, but it could properly refuse to recognize any society the constitution and rules of which it did not approve and withdraw recognition from any society which might fail to satisfy the committee that it was being properly administered. The committee could, if it saw fit, organize a system of inspection and audit of the operations and accounts of the affiliated societies and by these means secure a very substantial measure of control over their operations.

*Local War Savings Committees.*—In accordance with these views, the War Savings Committee embarked upon a widespread scheme for the promotion of savings associations, delegating the propagandist work in a large measure to local committees which were set up throughout the country. Before the war was over there were in existence in England and Wales 60 county committees and 1,840 local war savings committees acting as propagandist agencies under the general control of the central body, while the War Savings associations set up under their auspices numbered over 40,000 with a membership of approximately 4,000,000 people. (At the end of 1920 there were still 1,701 local committees and over 28,000 associations.) A savings association could be formed by any number of people who were willing to work together to secure the attainment of its objects. In practice it was found that an association could readily be formed by those who were already corporate in some way; for example, by those who were members of a trade union, a friendly society or a coöperative society, by fellow workers in a shop or factory, or by the members of a church, chapel or social club. Each association had its governing committee, secretary and treasurer.

Scotland and Ireland, with their separate organizations, developed the movement on similar lines. The total number of voluntary workers in the movement was estimated to be between 200,000 and 250,000.

*Official Agents.*—By the end of 1917, when nearly 30,000 War Savings associations had been affiliated, there had been established on an average one association for every 1,200 inhabitants in England and Wales. Most of the social and industrial groups were covered, but it was realized that a large section of the wage-earning population and, possibly, the most highly paid, did not readily join War Savings associations. Many employees objected to joining associations to whose books their employers might have access. They were of opinion that knowledge of the fact that they were saving money might tend to diminish the force of any claim they might make for enhanced wages on account of the increased cost of living. With a view to reaching the prospective small investors of this class, it was decided to add to the number of places where War Savings certificates and National War Bonds could be bought. Certificates were on sale at all money order offices and at most banks, but the majority of the class of persons under consideration had no banking account and had no reason to enter a bank. The Post Office staff was obviously unable to make any special effort to push the sale of Government securities, having regard to the heavy mortgage on their time caused by the manifold additional duties which the exigencies of the war period cast upon them. It was therefore arranged to license certain tradesmen and firms as official agents for the sale of certificates and bonds. These agents purchased the securities outright with their own funds and received the certificates and bonds dated, but unregistered. They then resold the certificates and bonds to their customers and others. By the end of the war, these securities were on sale at more than 14,000 shops and other establishments throughout the country. Very large numbers of certificates in the aggregate were sold in this way. The success of the system is noteworthy in that it involved the sacrifice by the official agents of the interest upon the capital used for the purchase of stocks of certificates between the dates of purchase and sale.

*Savings Schemes.*—The National Committee, following the guidance of the Montagu Committee, had also set itself the task of preparing various model schemes of coöperative saving to meet the requirements of the people. The following schemes were evolved at various times:—

*Scheme 1.*—Money subscribed through a savings association was invested in Post Office Exchequer bonds. For each £5 Exchequer Bond a subscriber paid 2s. a week for 50 weeks, or 10s. a month for 10 months. All sums subscribed were remitted to the Treasury each week, the Treasury paying interest on the amounts received at the rate of 5% per annum. The bonds and cash payments due to members were distributed half-yearly, e.g. in the case of subscriptions beginning May 1916 bonds and cash were distributed June 1 1917, weekly subscribers receiving a cash payment of 2s., and monthly subscribers 1s. 9d. The cash distributed was free of income tax, but had to be included in the income-tax return of mem-

bers. It could be paid at the Post Office or could be credited to an account in a savings bank. This scheme was not adopted on a wide scale and was abandoned at a later date. Schemes involving subscriptions for certificates were found in practice to be more popular and more easily worked.

*Scheme 2A.*—Monies subscribed through an association are invested in War Savings certificates. Subscriptions of 6d. or any number of sixpences are accepted. War Savings certificates are purchased from the Post Office with the cash received by the secretary from the members, and they are dated at the time of purchase, but they are not registered. Each member when he pays his first subscription is given a book. His subscriptions are entered in the book as and when they are paid. When the subscription of the member amounts to 15s. 6d., he is given a certificate and the registration portion of the certificate is then filled in and lodged at the Post Office. The method of distributing certificates of different dates and consequently of different encashment values is settled by the committee of each association. Members can withdraw before reaching the full 15s. 6d. and the amount deposited is repaid, but without interest. The advantage of the scheme lies in this, that if 31 people individually save 6d. a week for 31 weeks, they will each have a certificate at the end of 31 weeks, but if they join an association to which they pay 6d. a week, the association is able to buy one certificate each week, and at the end of 31 weeks it will have 31 certificates. The first of these certificates is dated 30 weeks earlier than a certificate bought by any member acting alone. On the average, they will be dated 15 weeks earlier and consequently will mature 15 weeks earlier. The books are provided free of cost by the National Committee. The book-keeping is necessarily somewhat detailed, but it is essential for the protection of members.

This scheme was probably the most widely adopted.

*Scheme 2B* is similar to Scheme 2A, but the certificates are not distributed until one year after the subscriptions of any member amount to 15s. 6d. The scheme was not widely adopted, people preferring to get their certificates immediately they had made up their 15s. 6d.

*Scheme 3* is in essence a savings bank—all the money received being invested in War Savings certificates. The minimum subscription is one penny. Any number of pennies are accepted. Subscriptions are withdrawable at 14 days' notice, or without notice in urgent cases. Each member has a book in which subscriptions are entered. On the completion of the payment of 15s. 6d. the member is registered as being entitled to the payment of £1 at the end of five years. The certificates are not distributed but are held by the association until they mature. A few associations in schools adopted this scheme, but after a time the majority ended by distributing the certificates to their members and adopting Scheme 2A.

*Scheme 4* was a scheme for investment by instalments in Exchequer bonds and War Savings certificates, the Treasury paying interest on the amounts received at 5% per annum. During the war no part of the amounts paid into the Treasury were withdrawable in cash. When an Exchequer bond or certificate was fully paid for the Treasury issued the security to the association for delivery to the member entitled to it, the cost of the securities being charged to the amount standing to the credit of the association with the Treasury. Cash was to be returned to the association three months after the end of the war. This scheme was not found satisfactory and was little adopted.

*Scheme 5* is a scheme similar in principle to Scheme 2A, but subscriptions are paid by buying from the association sixpenny coupons. The coupons are of a special "Swastika" design and can only be used for subscribing to associations by whom they are issued. The association is supplied on credit with coupons issued by the Central Committee and these have to be accounted for. The association overprints its coupons with its own serial number. Members get a coupon for each 6d. and place the coupon on a card. When the card is full it is exchanged for one of the certificates already purchased by the combined subscriptions of the members. As full cards of coupons come in they are sent to the Central Office in reduction of the association's liability for those supplied on credit. (At a later date the coupons were issued to the associations in the standing imprest system.) This scheme involved little or no ordinary book-keeping. A register of the issue of certificates was kept. The only clerical work involved of necessity was the keeping of a careful stock of the coupons. The scheme was adopted on a large scale and by some of the largest associations. As a general rule, local committees handled the distribution of the coupons in their districts. This threw a heavy burden on the local secretaries. Considerable difficulty was experienced in many instances in clearing coupon stock accounts, and the distribution of coupons on an enormous scale threw a large amount of work on the head office. The scheme is gradually being replaced by a more simple system of cards and savings stamps procurable from any post-office.

*Scheme 6* is a special scheme under which employers purchase certificates in advance for employees with their own funds. The certificates are purchased in blank, that is to say, unregistered, and sold to the employees by any form of instalment system preferred. The employer in effect makes a free grant to his employees of the interest accruing on the money between the date of purchase and the date of sale.

*Scheme 7* is a development of an earlier system under which the Post Office issued cards upon which 31 ordinary sixpenny postage stamps could be affixed by anyone. A card when filled with stamps was exchangeable at any money order office for a War Savings certificate. There was no advantage from coöperation. It was merely a simple device to enable people to save the money for a certificate by instalments of 6d. each.

When the Armistice was signed the National Committee gave careful consideration to devise some alternative scheme to avoid the heavy clerical labour entailed in the working of Schemes 2A, 2B, 3 and 5. This labour had been obtainable during the war on a voluntary basis and it is possible that the very labour itself indirectly assisted the movement in its early days in that it gave the officials of associations the knowledge that they were doing something definite for the benefit of the country in wartime. In 1918, the Post Office agreed to the issue of a distinctive adhesive war savings stamp with the Britannia head design. This stamp was placed on sale at all post-offices. Special savings cards containing 31 spaces were issued to savings associations. Treasurers and secretaries of associations provided themselves with stocks of the stamps, which they were authorized to procure as credit stocks, and they issued these to their members for cash. With the cash they purchased more stamps. The cards when filled were exchangeable for certificates at any money order office, and savings stamps purchased at any post-office or through any agency could be used. The scheme possessed considerable elasticity, as it enabled members of one association on transferring their residence to join another association and complete their subscriptions, or they could fill their cards with stamps purchased anywhere and exchange them for certificates anywhere. The disadvantage lay in the absence of the benefit of the early dating of certificates which was given by the other schemes—an advantage which, it was found in practice, was so generally appreciated that the new scheme, in spite of the saving of labour to the officials of associations, was not widely adopted. After considerable thought the scheme was revised and early in 1921 a system was introduced which, while maintaining the simplicity of Scheme 7, also gave the benefit of the early dating of certificates. The predating of certificates is secured by the use of date labels. The date labels (printed in pairs) are supplied by the National Savings Committee to the association officials. Whenever the official purchases Britannia head savings stamps, he can present at the post-office one pair of these date labels for every 31 sixpenny stamps purchased. The post-office official stamps the labels with a date stamp of that day. When a member of the association presents a card filled up with savings stamps all of which have been purchased from the association, the secretary affixes to the certificate which is issued in exchange for the card one of the officially dated date labels—one date label is affixed to the signature portion of the certificate and its fellow or counterpart is fixed on the counterpart of the certificate in the certificate book. This scheme therefore preserves the full benefit of early dating due to coöperative purchase and yet reduces the clerical work of the association official to the smallest compass. The only book which it is thought advisable for the official to keep is a control receipt book for acknowledging receipt of members' completed cards given in exchange for certificates, this serving also as a register of certificates, in case the member loses his certificate book. The value of savings stamps sold to Nov. 30 1920 was £1,739,000, of which approximately £1,464,000 had been exchanged for savings certificates.

*Municipal Savings Banks.*—The Municipal Savings Bank (War Loan Investment) Act, 1916, authorized the establishment, subject to certain restrictions, of municipal savings banks in municipal boroughs with populations exceeding 250,000. The only municipality to adopt this Act was Birmingham, where a bank was started at the end of Sept. 1916. The "Birmingham Corporation Act, 1919" extended the powers of the Corporation and authorized it to establish a savings and housing bank.

*Navy, Army and Air Services.*—Although military savings banks and facilities for saving in the army had existed since 1859, with the recruiting of large numbers of civilians for the new armies it was found that the normal methods of saving were insufficient to attract very large sums of money.

On the issue of the 4½% War Loan in June 1915 it was felt right that due facilities should be afforded the men in the army for making their investments through the Post Office issue of the Loan. Arrangements were accordingly made for any soldier whose pay account was sufficiently in credit to invest by instalments of 5s., 10s., £1 or £5, the amount being debited to his account and transferred to the Post Office through the regimental paymaster. Similar arrangements were made for the navy and the scheme was found to work so smoothly that it was eventually extended to Exchequer bonds and War Savings certificates as they became available, and ultimately for deposits

in the Post Office Savings Bank. The Post Office undertook the safe custody of the War Savings certificates and bonds for the investors. Later in 1916, by arrangement with the War Office, a special officer was entrusted with the work of establishing war savings associations in the army, with very satisfactory results. In 1917, £186,682 was saved through the army associations; in 1918, £3,162,975; in 1919, £1,804,580; and in 1920, over £1,000,000, making a grand total of £6,000,000. In June 1920 the Army Council, finding the savings associations had such a beneficial effect, made an order that all units both at home and abroad should form savings associations, and arrangements were made for command paymasters stationed abroad to hold stocks of certificates. The Air Ministry at the same time issued an order on similar lines. The War Savings movement was also carried into the navy and merchant service, suitable arrangements being made for remittance of monies through the paymasters and pay offices.

*Schools.*—It would be impossible to give even the briefest summary of the War Savings movement without reference to the work done by the savings associations in the schools of the country. Thanks to the influence of the Board of Education, and, particularly, to the efforts of a number of inspectors of the Board who were lent for service with the National Committee and who acted as the secretaries of the county committees and as local representatives of the Committee in the provinces, but, above all, thanks to the whole-hearted efforts of thousands of schoolmasters and mistresses throughout the country, there was scarcely an elementary school in the United Kingdom without an efficient and vigorous association. Before the war a very large number of schools had their penny banks. No attempt was made to supplant these. With the co-operation of the savings banks in connexion with which these penny banks were operated, arrangements were made to continue the penny bank system with the savings association methods, and often the two systems were carried on in the same school side by side. The old penny bank system as a "short term" saving machinery had a value which it would have been undesirable to destroy, while it naturally led by stages to the "long term" saving by means of the certificate. Most of the schools continued their banks and associations after the Armistice, and in no section of the community is the movement more alive and progressive to-day. It is impossible to say what proportion of the savings of the country stand in the names of the children, but it must amount to many millions sterling and this alone must have an incalculable effect on the future.

*Propaganda.*—The human machine created by the National Savings Committee was stimulated, from time to time, by every kind of publicity method. Thousands of public meetings were held and lectures given; educational pamphlets and leaflets dealing with the elements of economics were distributed; special campaigns with such stimulating machinery as "tank banks" were inaugurated; a system of commissioners and organizers in touch with headquarters kept closely in touch with the local committees; special organizations dealt with the army and the navy, munition works and other factories. The local authorities rendered invaluable assistance to the local committees by the loan of staff, the provision of office accommodation and in many other ways. The London and provincial press were consistently sympathetic to the movement and gave freely of their space to record its activities and assist its campaigns. During the war the organization was, from time to time, utilized by the Chancellor of the Exchequer to assist in the public issues of War Bonds and War Loans. During these periods invaluable help was given by leading press experts, who, in co-operation with the National War Savings Committee, undertook the control of special publicity campaigns (see WAR LOAN PUBLICITY CAMPAIGNS). These campaigns for the special issues greatly stimulated the small investor. On each occasion of the issue of a great public loan numbers of new associations came into being and the weekly purchases of certificates were very much increased. One of the most significant results of the adoption of these methods of publicity and propaganda was the great extension

of the numbers of individual citizens holding Government securities. Whereas before the war it was estimated that there were some 345,000 holders of Government securities, it is calculated that no less than 17 million people have to-day a holding in some form of State loan; while the aggregate amount subscribed by small investors through the Post Office for War Loans and other Government securities, including savings certificates, was nearly £500,000,000 at the end of 1920.

*Withdrawals.*—The Montagu Committee laid emphasis on the fact that the small investor wishes to be able to withdraw his savings at short notice without loss of capital. "The financial emergencies of life come upon the working man with startling suddenness. He may be thrown out of employment, or an illness or death in the family may result in an immediate call. He has not the facilities for credit which the wealthy or even the middle classes enjoy and money only obtainable at six or twelve months' notice is of little use to him." There is no doubt that the losses sustained by the working-classes from their investments through the Post Office in Consols and other similar long-dated securities through the automatic fall in capital value due to the rise in the general rate of interest has had in the past an adverse influence on thrift. Hence the arrangements that War Savings certificates should be repayable at a definite value which is never less than the amount invested, and within two or three days of demand, that is to say, allowing time for identification of the registered holder to avoid payment to a wrongful possessor.

An analysis of the withdrawals of savings certificates is interesting. The total number of certificates sold in the United Kingdom from Feb. 16 1916 to the end of Dec. 1920, was 440,076,000 in 41 units, of a total value at 15s. 6d. each of £343,259,000. The total repayments due to withdrawals, including interest, amounted to £61,404,089, of which £3,521,948 8s. 7d. represented interest. The percentage of the value of certificates repaid (excluding interest) to total value of certificates issued was 18·01 per cent. This percentage may be considered satisfactory when one considers the calls upon the small investor and the fact that the current rate of interest on the shares of well-established commercial and industrial concerns since the Armistice has been very attractive. Much money has been withdrawn for housing, as is evidenced by the case of Higham Ferrers in Northants, a town of 2,500 people, where no less than 50 men have bought their houses through investments in savings certificates.

*Post-Armistice Period.*—In 1917 a committee was appointed by the National Committee to consider what facilities for saving should be provided for the small investor after the war. The committee in their report stated that the habit of saving had, as a result of the War Savings movement, been formed by many people of all classes who had not previously acquired it, and that this habit ought not to be allowed to lapse and that the State should continue to encourage saving after the war by continuing to offer special facilities to the small investor. They saw no reason to suppose that the State would at any time be unable to use profitably the money of the small investor. They pointed out that the ordinary borrowing capacity of the State would be severely taxed by the necessity for renewing and, when possible, consolidating the floating debt, and they considered it worthy of serious consideration whether a plan might not be adopted for applying the proceeds of post-war borrowing from the small investor in order to secure funds for public utility services, such as the housing of the working-classes and other projects of social urgency, the funds for which it might be difficult, if not impossible, to raise otherwise for a considerable period. The committee strongly advised the preservation of the savings machinery established during the war and recommended the permanent continuance, subject to modifications, of the War Savings certificate. The continuance of the savings organization was also recommended by the "Committee on Financial Facilities" appointed in 1917. In their report, dated Nov. 21 1918, they said:—

"We are impressed by the enormous potential increase in the number of the small investors. The continuance on the part of the people of this country of the habit of investing their savings constitutes a most important factor in the provision of the capital necessary for the rapid reconversion of trade and industry. It is impossible to over-estimate the value of the work done by the war savings associations throughout the country, in encouraging habits of thrift

¶ The deposits included £55,109,506 on account of war gratuities to soldiers and sailors.

N.B.—During the year ending Dec. 31 1920, 57,787,499 certificates of a cash value of £44,785,311 were sold, and repayments, including exchange for War Loans, etc. (excluding interest), amounted to £31,829,879.

and economy. Government securities furnish by far the best and safest medium for the investment of small sums of money, and we are glad to notice that steps are to be taken, by means of savings associations, to continue the policy which had proved so successful during the war."

Immediately after the Armistice steps were taken to consolidate the position of the organization and to render permanent the machinery which had been set up during the previous three years. The county committees were disbanded, their work having been delegated to local committees which they had formed in practically every local area in the country. Steps were taken to devise a complete representative system throughout the organization. Adopting the association, or savings club, as the fundamental unit of the movement, steps were taken to ensure representation of the associations on the local committees. The local committees in their turn elected representatives on a new body called "The National Savings Assembly," which was to meet twice a year to discuss questions relative to the movement and at one of these meetings to elect representatives on the National Savings Committee, which, by the authority of the Government, dropped the word "war" out of its title. At the same time the personnel of the National Committee was considerably strengthened. In 1921 it formed a powerful body composed of representatives of Government departments and corporations and interests connected with thrift, together with representatives of the savings organizations in London and the provinces elected on a wide franchise, so that its continued influence could not fail to be beneficial to the community.

*Savings and Local Government Finance.*—In the summer of 1920 a step was taken which might well have far-reaching effects on the relations between local and Imperial finance.

The Finance Act 1920, Section 59, provided that 50% of the proceeds of the sales of savings certificates could be invested through the National Debt commissioners in local loans stock or bonds on the security of the local loans fund. Half the proceeds of the gross sales after Oct. 1 1920, in the area of each local authority, would be available, if required, for loans to meet authorized expenditure in connexion with the assisted housing scheme of that authority. These loans were to be made, irrespective of the ratable value of the local authority, by the Public Works Loan commissioners, on the terms in force for the time being for ordinary loans to local authorities from the local loans fund for subsidized housing schemes. In the first instance, such loans would be restricted to housing purposes, but it was hoped that, when the existing difficulties with regard to housing finance had been overcome, the scheme would be given a more general application and that the system would become a permanent feature of local finance, bringing to the aid of local authorities a new source of capital which many of them had long been seeking. The authorities derive the greater part of

the benefit under the scheme, since, although they receive only half the proceeds of the certificates sold, they are not responsible for finding any of the money required to meet withdrawals.

A critic of the ordinary savings bank in the last century said: "The savings bank is after all only a slot in the wall, with a sure grasp, but no tongue to advise it. Having no fructifying use for the money that comes to it from productive employment it closes over it like a grave and effectually sterilizes it"; and Sir E. Brabrook, Chief Registrar of Friendly Societies in 1897, said he "could look upon ordinary savings banks merely as infantile efforts in thrift." He regarded "a person who deposited his money in a savings bank so that it should be kept safe for him by someone else as very much less worthy of encouragement than a person who used his savings in some way in coöperation with other people for his own benefit or the benefit of others." He "did not look upon the progress of the savings bank with unalloyed satisfaction, but only as one step to self-help."

The system of linking up National Savings certificates with local finance becomes, in effect, a national credit bank spread over the whole country. The credits of the small investor, even the half-pennies and pennies saved by the school-children, are rendered, through the machinery of the savings certificates, the Post Office, the National Debt commissioners, the Treasury, the local loans fund and the local authorities, available for investment in social and beneficial enterprise for the good of the people themselves. Owing to the widespread area from which the money is raised, short-term borrowing can be used for long-term loans with the minimum of risk, while saving is stimulated amongst the very class to whom in the past it has been most difficult to teach economy and saving. The linking-up of "saving" with the definite use of the money saved continues effectually the teaching of the war and inculcates the lessons of economy, and goes far to meet Sir E. Brabrook's criticism of the savings bank. The system is certain to stimulate the interest of the small investors in local finance generally. Not only will this be a source of financial strength to the local authorities, but educationally it will be a great advantage, and the active coöperation of the local authorities and the savings committee should do much to stimulate habits of thrift and saving.

## OTHER COUNTRIES

The American savings movement is dealt with later. As regards other countries in the war it may be noted that the British National Committee had its organization in the East for the sale of War Savings certificates, the China and Japan War Savings Association having nine centres in China and three in Japan. The Japanese Government itself during the war sent its representatives to inquire into the methods of the National Savings Committee, and established its own system of National Savings certificates with terms of three, five and ten years.

In Canada, war savings and thrift stamps were issued by the Canadian Government.

The Government of S. Africa after the Armistice placed "Union Loan Certificates" on sale at every post-office where savings bank or money order business is transacted. The S. African scheme closely resembled the British savings scheme. Cards were issued with spaces for 15 one-shilling stamps. The cards were issued at an initial price of sixpence. When the card was completed, it could be exchanged for a 15s. 6d. certificate which is worth £1 in five years. The maximum purchasing limit is £387. 10s. od. for 500 certificates. The S. African Government also adopted the scheme of associations in savings clubs on the British model.

STATISTICS.—In the preceding tables statistics are given of the results of the work done under the National Savings Committee. (T. G. CH.)

#### UNITED STATES

Upon the declaration of war by the United States in April 1917 it became evident that the nation must practise strict economy if the huge war-time expenditures were to be successfully financed and material aid given to the Allies. Not merely in money, but in consumption (which means money), the resulting movement for economy among the American people was vigorously taken up. As a first step toward conservation, President Wilson on May 19 1917 outlined a food control programme and appointed Herbert Hoover Food Administrator, and Congress passed the law commonly known as the Lever Act, effective Aug. 10 1917—"an Act to provide further for the national security and defence, by encouraging the production and conservation of supply and controlling the distribution of food products and fuel." The administration of the Act was under the direction of a U.S. Food Administrator and a U.S. Fuel Administrator. The Food Administration summed up its purpose in the motto: "Food will win the war." The following specific ends were sought: (1) to save food and eliminate waste; (2) to distribute food equitably and cheaply; (3) to stimulate production; (4) to prevent hoarding; (5) to save transportation; (6) to provide for the needs of the U.S. army and navy; (7) to secure the largest possible amount of food for the Allies.

The most vital early need both for America and for the Allies was the conservation of sugar and wheat. The shipping shortage was so acute that it was impossible to procure the large surplus of raw sugar in Java, amounting to nearly 1,000,000 tons. Exports of sugar from the United States for the year 1917 were more than 17 times the average for the three years preceding the war. In Aug. 1917 the cost of spot sugar reached \$9.15 per cwt. seaboard basis, and the demand was still unfilled. During this month an International Sugar Committee was appointed. Under the operation of this committee the price of Cuban raw sugar declined to \$6.90 by Sept. 14, which was the fixed maximum for the season's crop. The prices to the consumer were maintained at from 8½ cents to 10 cents per lb., varying with the location. As the difference of one cent per lb. added to the price of sugar meant an added burden on American homes of \$72,000,000, the importance of the sugar regulations is evident. As the needs of the United States and of the Allies became more acute, the Licence System governing dealers in food supplies was put into effect and various regulations adopted which governed the producer and consumer alike. In order to control the sugar situation it was announced on May 2 1918 that on and after May 15 sugar should not be sold for manufacturing purposes either by refiners, wholesalers or retailers, except upon the presentation and cancellation of certificates issued by a State Federal Food Administrator, showing the quantity of sugar sold. Retailers were restricted from selling sugar to consumers in quantities greater than 2 lb. for city residents and 5 lb. for those residing in the country, except for home canning, in which cases the dealer was required to secure certificates for the amount sold. By the operation of this system and the voluntary restriction of household consumption, a saving of between 400,000 and 600,000 tons was effected in 1918.

The most serious crisis faced by the Food Administration during its operations was the wheat shortage of the season 1917-8. In the United States the crop, following the exceedingly short harvest of the previous year, was only sufficient to meet normal demands for home consumption. France and England, which together normally produce about one-half the wheat they consume, both suffered very great crop losses, and their total production was considerably less than one-third their normal consumption. In Jan. 1918 an official communication was received from Great Britain stating that, unless America could send the Allies at least 75,000,000 bus. of wheat over and above what they had exported up to Jan. 1, there was grave fear that the war would be lost because of the lack of food. The United States Food Administration replied to this advice: "We will export every grain that the American people save from their normal consumption. We believe our people will not fail to meet the emergency." All manufacturers in the United States using wheat flour in the production of various foods were placed under licence,

and either strictly limited in their use of wheat to a definite percentage of their normal requirements or were denied the use of wheat entirely. Wheatless days and other measures for wheat conservation were established. Mills were permitted to grind only a certain percentage of the amount of wheat milled during a corresponding period the previous year. Wholesale dealers were prohibited from purchasing wheat flour in excess of 70% of the amount they had purchased during a corresponding period of the previous year. In sales to consumers the retailers were required to sell an equal quantity of substitutes to the purchaser at the time wheat flour was sold. The pledge-card campaign was started in Oct. 1917, and between 13,000,000 and 14,000,000 women registered in support of food conservation by substitution. Between Oct. 1 1917 and Aug. 1 1918 hotels, restaurants, dining cars and clubs of the country effected a saving of more than 50,000,000 lb. of flour and wheat products. Flour-mills were required to raise their percentage of extraction to 74% and to eliminate altogether the sale of patent flours. This resulted in a saving of 13,504,300 bus. of wheat. Bakers were required to use a certain percentage of substitute flour in all breads, and this resulted in the saving of 16,830,000 bus. of wheat. These various measures made it possible for the United States to send abroad in 1918 approximately 140,000,000 bus. of wheat.

The importance of fats and oils in the diet of a people caused the Food Administration to lay stress on the conservation of meat products. Export of fats to neutrals was greatly restricted and the amount of fats used in bakery products limited. In 1918 1,125,397 short tons of hog products were exported as against \$39,000 in the fiscal year ending June 30 1899, the largest in any previous year. In March 1918 exports averaged 10,000,000 lb. a day. Normally the United States exports yearly a little over 10% of its total pork production. In 1918, under the pressure of war needs, nearly 20% of a much larger production was exported. In 1918 773,000,000 lb. of beef were exported, or over three and a half times the exports on the average of the three war years. These supplies were made available by the conservation of meats formerly wasted, by volunteer rationing and by the adoption in many localities of meatless days and meatless meals.

As the demand on transportation facilities became increasingly heavy, it was vital to keep the routes by which food passed from the producer to the consumer as active as possible. The tremendous increase in the exportation of food and munitions, coupled with the shortage of ocean tonnage, congested eastern terminals. To remedy this condition, a regulation was promulgated providing an average increase in the minimum car-loads of about 50% over those of the published tariffs of the carriers. Thus the number of cars required for the distribution of the commodities on the list of non-perishable groceries was reduced fully 25%. Much material formerly wasted was salvaged by the Waste Reclamation Service, organized originally under the War Industries Board and later transferred to the Department of Commerce. One million five hundred thousand tons of book and writing material were made in 1918 from old paper. The total value of all waste material reclaimed during 1918 was approximately \$1,500,000,000. In monthly reports as to garbage utilization during 1918 it was shown that the redemption plants reclaimed more than 50,000,000 lb. of garbage grease and 160,000 tons of fertilizer tankage from garbage.

Several conservation projects were developed in conjunction with food conservation. The National Emergency Food Garden Corporation put 1,500,000 ac. of city and town land under cultivation in 3,000,000 gardens, resulting in an increase of the food supply to the value of over \$350,000,000 in one year. The School Garden Army, 6,000,000 strong, raised and preserved fruits and vegetables and also aided in the utilization of waste products. Community canning kitchens were widely conducted. The Women's Land Army had during the summer of 1918 units in 20 different states, showing an enrolment of 10,000 in camps and 5,000 in emergency units. They were engaged in fruit packing, dairy work, truck gardening and general farming. Cash-and-carry plans were encouraged and the limitation of deliveries to one a day to any family or on any one route was recommended.

The U.S. Food Administration began its work in Aug. 1917, with Dr. Harry A. Garfield as director. The Administration set out to accomplish: (1) increased production; (2) better distribution; (3) fair sale prices; (4) the elimination of waste. Small production was largely due to strikes. The Fuel Administration succeeded in getting employers and employees into agreement and eliminated much of this difficulty. In April 1918 a nation-wide plan designed to insure equitable distribution of coal was put into effect. An essential feature was the zoning system, by which more than 5,000,000 tons formerly shipped from eastern mines to western territory adjacent to western mines was saved for the eastern states where the demand of war industries was greatest. All the price-fixing was done by territory. Inspectors visited each one of the 250,000 industrial plants in the United States using large amounts of coal and worked out with the management systems of conservation. In one week 50,000 tons of coal were thus saved in Pittsburgh alone. Rationing was put into effect, the supply of coal to non-essential industries being greatly reduced. It was estimated that this saved over 1,000,000 tons. All industries were held to their minimum needs. Stores and office buildings were encouraged to take their electric current

from central plants. The "skip-stop" system on electric street railways by which no stops were made at unimportant crossings resulted in a great saving. Economy was also effected by lightless nights, which affected window lighting, electric display and street illumination. Home instruction was given in the operation of heating systems and in the use of electricity. For several weeks heatless Mondays were observed in stores, office buildings and places of amusement. A saving of 12,700,000 tons of coal for the first half of the coal year was thus effected.

On March 19 1918 the President approved the legislation entitled "An Act to save daylight, and to provide standard time for the United States." The purpose of this legislation was to conserve daylight and the Act is commonly known as the "Daylight-Saving Law." It provided for setting the clocks of the nation ahead one hour at two o'clock on the morning of the last Sunday in March of each year and for retarding them by one hour at the same time on the last Sunday in Oct. of each year. By the same piece of legislation the United States was divided into five standard zones. After the repeal of this Act in Aug. 1919, several of the states enacted daylight-saving laws. The operation of the daylight-saving plan caused the saving in seven months of approximately 1,250,000 tons of coal.

Gasoline-less Sundays were inaugurated in Aug. 1918. A cessation of Sunday motoring from 75% to 99% was effected. This resulted in an estimated saving of 1,000,000 bar. of gasoline, from which it is known that 500,000, or 10 shiploads, were sent overseas. The order governing the use of gasoline was withdrawn on Oct. 20 1918.

Under the provisions of "An Act to authorize the President to increase the military establishment of the United States," approved May 18 1917, and later amended, the President was authorized to raise and maintain military forces by selective draft "under such regulations as the President may prescribe not inconsistent with the terms of this Act." Under this law certain exemptions were made removing the liability to military service from those whose industrial occupations were deemed essential to the proper prosecution of the war. Along similar lines several of the states passed like enactments, commonly termed "Work or Fight laws," by which those who had been exempted from military service were forced to accept employment in essential industries or else join the military or naval service and thus conserve the man-power of the nation. Non-essential occupations were listed and because of the simultaneous enactment of a drastic law against loafing in the state of New York the New York City Federal Employment Service was overrun with applications. Over 6,000 were registered July 1, and the next day after the order had been given publicity one bureau registered over 10,000. The majority were from the non-essential occupations, together with a small percentage of the idle or vagrant classes.

The Conservation Division of the War Industries Board was established May 9 1918. Its purpose was to eliminate wasteful or unessential use of labour, material, equipment and capital. Its specific aim was: (1) to secure the maximum reduction in the number of styles, varieties, sizes, colours or finish of products of the various industries; (2) to eliminate accessories which used material for adornment or convenience, but which were not essential; (3) to substitute materials which were plentiful for those which were scarce; (4) standardization; (5) reduction of waste; (6) economy in samples; (7) economy in containers and packing. The length and swing of men's sack coats and overcoats and the width of facing were limited, the size of samples reduced and each manufacturer restricted to not more than 10 models of sack suits for the season. This resulted in a saving of from 12 to 15% of material. A saving of 33% of wool used in the knitting of sweaters was effected by the reduction in styles and colours. For example, only one shade of green was used where formerly there were many. Manufacturers of shoes were restricted to white, black and tan; wasteful features were eliminated and height limited. As a result one tanner reduced his line from 81 colours and shades to 3, and manufacturers in general reduced their line by about two-thirds. A schedule issued Sept. 13 1918 to manufacturers of rubber footwear provided for the elimination of 5,500 styles, with an estimated annual saving of 29,012,600 cartons, 5,245,300 sq. ft. of shipping and storage space, 2,250,272 lb. of material to be dyed, 74,750 lb. of starch, 30,380 gal. of varnish, 125,300 lb. of tissue paper and 49,617 days of labour.

In addition to the efforts of the War Industries Board there were numerous appeals by Government officials and patriotic organizations to conserve clothing and shoes. As a result a very great proportion of the people wore garments which in normal times would have been discarded. Patching and remaking of clothing became popular practices. Although it is impossible to estimate the saving effected, it is undoubtedly true that many millions of dollars, which would ordinarily have gone for the purchase of wearing apparel, were used to purchase Liberty Bonds and to aid various war philanthropies.

The Pulp and Paper Section of the War Industries Board was organized June 6 1918 to restrict the use of paper and its products and thus to save fuel, transportation and labour. On July 5 1918 the following preliminary economies were requested of all newspapers publishing daily and weekly editions: that they (1) discontinue acceptance of the return of unsold copies; (2) discontinue the use of all samples and complimentary copies; (3) discontinue giving copies to anybody except for office working copies or where required by statute law in the case of office advertising; (4) discontinue giving

free copies to advertisers except not more than one copy each for checking purposes; (5) discontinue arbitrary forcing of copies on news-dealers; (6) discontinue the buying back of papers at either wholesale or retail; (7) discontinue payment of salaries or commissions to agents, dealers or newsboys for the purpose of securing equivalent of return privileges; (8) discontinue all free exchanges. On Sept. 20 the following additional regulations went out: no publisher shall sell his paper at retail less than his published prices; no publisher shall use premium contests or similar means to stimulate his circulation; no publisher shall issue holiday, industrial or Sunday special numbers. These regulations brought about a saving in paper during Sept. of 10.4% of the average monthly tonnage during the six months preceding and in Oct. of 5%. There was produced in Sept. 1918 104,209 tons and in Oct. 110,498 tons. All regulations relative to paper were withdrawn on Dec. 15 1918.

The universal response by the people of the United States to the request that they lend money to the Government to provide necessary funds for the prosecution of the war was one of the most significant things of the war period. Millions of people purchased Liberty Bonds and Victory Notes in various denominations from \$50 to \$10,000 (see LIBERTY LOAN PUBLICITY CAMPAIGNS), and other millions invested in the smaller War Savings securities. Early in the war President Wilson made the statement: "I doubt that many good by-products can come out of a war, but if our people learn from this war to save, then the war is worth all it has cost us in money and material." This statement, together with the desirability of having the entire nation participate in financing the war, suggested the underlying purpose behind the war savings movement, which was put into operation in Dec. 1917. Section 6 of the Second Liberty Bond Act, approved Sept. 24 1917, authorized the Secretary of the Treasury "to borrow from time to time on the credit of the United States for the purpose of this Act and to meet public expenditures authorized by law, such sums as in his judgment may be necessary and to issue therefor at such price or prices and upon such terms and conditions as he may determine War Savings Certificates of the United States on which interest to maturity may be discounted in advance at such rate or rates and computed in such manner as he may prescribe." The Act further provided that "each War Savings Certificate so issued shall be payable at such time, not exceeding five years from the date of its issue, and may be redeemable before maturity, upon such terms and conditions as the Secretary of the Treasury may prescribe." A limitation of \$2,000,000,000 was placed by the Act upon the amount of War Savings Certificates which might be outstanding at any one time; it also provided that no person should be sold at any one time certificates amounting to more than \$100, and it also placed a \$1,000 limitation upon the amount of certificates which might be held by any one person. The original Act was amended by the Act approved Sept. 24 1918, which increased the amount of certificates which might be issued from \$2,000,000,000 to \$4,000,000,000, removed the \$100 limitation on the amount of certificates which might be sold to any one person at any one time, and also altered the previous Act by allowing persons to hold an amount not to exceed \$1,000 worth of any series of certificates.

Pursuant to the authorization contained in the original Act, the Secretary of the Treasury appointed a committee of five, with Frank A. Vanderlip as chairman, to confer with him as to the form of security and the terms on which it should be issued. Following the recommendation of this committee, the Secretary of the Treasury offered for sale on Dec. 3 1917 an issue of War Savings Certificate Stamps, Series of 1918. Each certificate stamp when affixed to a War Savings Certificate (a folder with spaces for 20 stamps) would have a fixed maturity value of \$5, with the date of maturity not to exceed five years, the purchase price to vary one cent each month throughout the year of issue, beginning in Jan. at \$4.12, increasing to \$4.23 in December. The stamps might be redeemed before maturity, their redemption value increasing one cent each month. There were also provided 25-cent Thrift Stamps, bearing no interest and not redeemable for cash, but to be accumulated on a Thrift Card until there were 16, when they could be exchanged for a War Savings Certificate Stamp by paying the additional odd cents necessary to cover the current price of the War Savings Cer-

tificate Stamp. Succeeding issues of War Savings Certificate Stamps were on Jan. 1 1919, Jan. 1 1920 and Jan. 1 1921.

In addition to the original securities there were offered in July 1919 Treasury Savings Certificates, one of \$100 and the other \$1,000 maturity value. Treasury Savings Certificates were registered at the Treasury Department at the time of purchase and increased in redemption value monthly on the same interest basis as War Savings Certificate Stamps. In Jan. 1921 there were offered for sale \$1 non-interest-bearing Treasury Savings Stamps and \$25 Treasury Savings Certificates, in addition to the other Treasury Savings Securities.

Following the working out of the types of securities in 1917, an organization for their sale was effected. In addition to the National War Savings Committee, consisting of the chairman and four members, the Secretary of the Treasury appointed six Federal directors, each having general supervision over approximately two Federal Reserve Districts; and 52 state directors, each of whom had complete charge of War Savings activities in his state or part thereof. The National War Savings Committee and the six Federal directors functioned at the National War Savings Committee headquarters in Washington. It was the duty of this sales organization to obtain coöperation from the heads of all enterprises operating nationally and then to decentralize the work through the Federal directors to the respective state directors coming under their jurisdiction, the ultimate goal being to offer every man, woman and child in the United States the privilege of aiding the Government by investing in Government securities, and at the same time to develop habits of thrift. The War Savings securities were put on sale at every post-office, at banks and in thousands of voluntary agencies. House-to-house canvass for their sale was made by postmen, boy scouts, representatives of insurance companies and members of women's organizations. In the autumn of 1918 the Treasury Department created a Savings Division of the War Loan Organization, which took over the work previously carried on by the National War Savings Committee, so that the people of the country might be taught for their peace-time value the lessons of thrift and saving learned during the war. The specific ends sought were: (1) to develop and protect all war issues of Government securities; (2) to sell Treasury Savings securities; (3) to make permanent the habits of regular saving and investment in U.S. Government securities. The Savings Division was placed in charge of a Director of Savings, with an organization in Washington, and one in each of the 12 Federal Reserve Districts.

School Government Savings systems were established. Instruction in thrift, saving and the principles of sound finance was introduced in schools throughout the nation. At the annual convention of the National Education Association in July 1920 a committee of state superintendents was appointed to work out with the Savings Division the best plans for placing the savings movement permanently in the American school system. The American Federation of Labor and various labour bodies passed resolutions commending the work of the Savings Division and calling on the Government to make permanent the policy of issuing small securities. Many local labour organizations invested their reserve funds in Government securities. In industrial plants throughout the country Government Savings Associations were established and the employees put aside small amounts regularly each week in Government Savings securities. Women's organizations of the country during the years 1919 and 1920 created the office of thrift chairman in their boards of officials. They took up the study of finance at club meetings, promoted the use of the household budget and with the savings thus effected purchased Government securities.

The total sale of War Savings securities from Dec. 3 1917 to Jan. 1 1921 amounted in round figures to \$1,176,111,000. The total redemption of War Savings securities for the same period amounted to \$415,174,000. (W. M. L. E.)

**SAXONY** (see 24.265).—The pop. of the Territory and Free State of Saxony, according to the census of 1919, was 4,663,298; in 1910 it was 4,806,661.

During the last few years before the World War political life in the German kingdom of Saxony was dominated by a conflict about the constitution. The parties of the Left had for years demanded a reform of the First Chamber, the Upper House, by which the predominance of the Agrarians in that House should be broken, and commerce, industry, and handicrafts should obtain greater influence. In Jan. 1910 the National Liberals, the Liberals (*Freisinnige*) and the Social Democrats once more introduced resolutions with this object in the Second Chamber, the Lower House, but these proposals met with the keenest opposition from Government, which shared the opinions of the Right. Notwithstanding the majority in the Lower House for the Reform, it was defeated by the refusal of the Upper House to accept it. It was only in Dec. 1917, that the Government introduced a bill for the reform of the Upper House, which again led to fierce conflicts between the Right and Left parties in Parliament, but the advent of the Revolution put an end to these conflicts. Simultaneously controversy concerning a new Electoral Law for the Lower House had constantly been going on since 1910. In Nov. 1911 a Social Democrat was for the first time elected Vice-President of the Diet. With the outbreak of war these questions fell into the background. In the educational sphere the reform of the National Schools System, which was especially advocated by the teaching profession in Saxony, aroused sharp conflicts of opinion among almost all classes of the people. The teachers were fighting for a development of the school system on lines of greater liberty and particularly desired that religious instruction should be regarded in a more liberal light. In 1912 the Government introduced a bill, which did not fully meet the wishes of the school teachers. After some elaborate debates in the Lower House, which produced great excitement throughout Saxony, the bill was rejected in Dec. 1912.

On Nov. 30 1910, Dr. von Rüger, who had been Minister of Finance for many years and at the same time had presided over the Ministry, retired, his successor as Finance Minister being von Seydewitz, while the minister of Justice, von Otto, took over the presidency of the Ministry and was in turn succeeded by the Minister of War, Freiherr von Hausen, in Sept. 1912, who on May 21 1914 gave place to von Carlowitz. The latter resigned his office to Lt.-Gen. von Wilsdorf on Oct. 27 1915 on taking a command in the field.

The year 1913 saw the opening in June of an airship base at Leipzig, the largest in Germany at that date.

On Oct. 18 1913 the unveiling of the monument commemorating the *Völkerschlacht* (the great victory of the continental Allies over Napoleon Oct. 16-18 1813) took place in Leipzig, a celebration at which the Emperor William II, and all the German sovereigns were present. After the ceremony the foundation stone of the German Library was laid, an institution which has since been completed and put in working order. All German publishers have undertaken to place a free copy of every work published by them at the disposal of this library, so that it already possesses more than a hundred thousand volumes. On July 29 1916 the Technical School of Mining at Freiberg, the oldest institution of its kind in Germany, celebrated the hundred and fiftieth anniversary of its foundation.

Saxony, which is chiefly an industrial country and cannot boast of much agriculture, suffered more under war conditions than most other German states. As a country which had been hitherto provisioned from outside, it found the problem of supplying food to its population extremely difficult. There was in many places a real dearth in the most important foodstuffs, such as corn and potatoes, so that the population was frequently obliged to have recourse to substitutes (*Ersatzmittel*).

Shortly before the outbreak of war, during the week July 17-24 1914, King Friedrich August of Saxony was on a visit to the Russian court at Petrograd; then on Aug. 2 the King's warlike appeal to the civilian and military population was published. At the beginning of the war the Saxon troops suffered heavy losses during their advance into the north of France. Already in 1917 the extreme Left in the Saxon Diet had begun an agitation, which never abated, for the early conclusion of peace; this demand led to violent debates between the Left and the Government, the latter being supported by the parties of the Right. On Oct. 26 1918 the Cabinet was forced to resign and to give place to a new Government of a more Liberal colour under Dr. Heinze. On Nov. 9 1918 the revolution broke out, and King Friedrich August abdicated on Nov. 13. A Cabinet of Commissaries of the People (*Volksbeauftragte*) was formed and was entirely composed of members of the extremist section of the Social Democrats, the Independent Socialists. The revolutionary conflicts of Jan. 1919, which entailed sanguinary street fighting in Leipzig, Dresden and other Saxon cities, led to the resignation of the Cabinet, which was succeeded by a Government of the right wing of the Social Democratic party. The extreme Left instituted demonstrations against this Government through-

out the country, and there were serious excesses, especially in Plauen and Leipzig. In April 1919 a Councils (Soviet) Republic was proclaimed at Leipzig. It was only on May 12 that the *Reichswehr* (the regular army of the *Reich*) under Gen. Maerker entered the city and put an end to the Soviet Republic. Serious disturbances followed in the Vogtland and in Chemnitz in June and August. On Oct. 2 1919 the (non-Socialist) Democratic party joined the Ministry, which was now composed of Social Democrats and Democrats. The Ministry kept in power till April 25 1920. It was replaced by a Coalition of Social Democrats and Independent Socialists; which, when the Diet reassembled, received a vote of confidence. This Cabinet was vigorously combated by the non-Socialist parties, all of which voted against the salaries of ministers in April 1921.

The insurrectionary movement of the spring of 1920 had been very formidable, especially in W. Saxony. In Leipzig sanguinary fighting continued for several days, and there were heavy casualties. In the Vogtland the Communist Hölz formed a band of several hundred men, with which he conducted a reign of terror in the towns and villages. The Government long hesitated to take action against him; finally, however, Hölz's force was surrounded and dispersed by *Reichswehr* troops. Hölz himself fled across the frontier into Czechoslovakia, where he remained until the Communist rising of March 1921 in central Germany, when he returned and took command of the insurgents. After the collapse of the insurrection he was for a time in hiding in Berlin, where he was ultimately arrested, and after a trial which lasted a fortnight was condemned to penal servitude for life with the loss of civil rights (June 1921).

In July and Aug. 1920 there were widespread food riots in Saxony, but they did not assume the dimensions of the fighting in Leipzig and in the Vogtland. In the first half of 1921 there had been no further disturbances. (C. K.')

**SAZONOV, SERGIUS DMITRIEVICH** (1866– ), Russian statesman, came of a family of great Russian landowners. He was educated at the Alexandrovsky Lycée. In politics he was connected with a group which formed the Right Centre in the Council of the Empire and supported the general policy of Stolypin. Enlightened and convinced of the necessity of reforms, he remained, however, a staunch supporter of the monarchical and orthodox tradition of Imperial Russia. He entered the diplomatic service, and his first important post was that of Councillor of Embassy in London, where he assisted Count Benckendorff in the task of improving the relations between Great Britain and Russia. He subsequently acquitted himself successfully as Russian Minister at the Vatican. He was appointed Minister of Foreign Affairs in St. Petersburg at a critical juncture when Isvolsky left that office for the Paris Embassy. Russian policy had just disengaged itself from the coils of the traditional friendship with Germany, and the Kaiser, though still corresponding with "Dear Nicky" and keeping a personal representative in attendance on the Tsar, had given up the scheme of cementing an alliance with Russia against England and forcing France into the combination. Germany was demonstrating "in shining armour" by the side of Austria-Hungary, and was drawing Turkey away from her former protectors, the Western Powers. The idea of the penetration of the Near East was developing the more effectually as the scheme of directing Russia towards the Far East had proved unsuccessful. The backing of Austria and Turkey by Germany meant necessarily the crushing of the Slavonic Balkan States and a conflict with Russia. Sazonov was the most appropriate person to oppose this aggressive tendency with firmness and dexterity, but without chauvinism. He managed to strengthen the ties of mutual confidence between Russia and Great Britain by avoiding all kind of provocation in Central Asia or in Persia; as to France, the solidity of the alliance was beyond question. The treatment of the Balkan nationalities was a much more complicated problem. And when, after the disastrous squabble between the Balkan allies in 1913, the peace of Bucharest left Bulgaria bleeding, humiliated and weakened, the result was not only the destruction of the Balkan League, but a lasting alienation of Bulgaria from Russia and from the

Western Entente. Russian diplomacy did not shine in those days: ineffectual attempts at arbitration between Serbia and Bulgaria, ineffectual discontent with the progress of the negotiations at Bucharest, and eventual recognition of defeat in the end, did not enhance the prestige of Russian foreign policy.

When the great crisis broke out in 1914, after the assassination of the Archduke Franz Ferdinand, the Tsar and Sazonov found themselves heavily handicapped by events. Both had tried to avoid the outbreak of war: but it was impossible for Russia to look on while Serbia was being delivered to the tender mercies of an Austrian inquisition, or to allow Germany to mobilize under the protection of specious formulas without herself taking any steps as regards the slow mobilization of the Russian army. Sazonov saw clearly that war had been decided upon in Berlin, and he helped to make it clear to the Tsar that the German talk about the ancient tie between the two Empires and the services rendered to Russia during the Japanese war was mere manoeuvring for position. The precise sequence of events is narrated elsewhere. Suffice it to say that the early course of the war itself showed how the Balkan situation had been irremediably jeopardized by preceding diplomatic mistakes and mishaps. Turkey, Bulgaria and Greece fell away one after the other. Possibly none of these events could have been averted, but it is sufficiently clear that neither the Entente Powers nor Russia in particular were prepared for them, and that they did not take in time measures which would have made them less injurious: the Straits could have been forced when the "Goeben" and "Breslau" passed them; Bulgaria might possibly have been won over by concessions, or attacked with advantage before she was ready to strike. In any case the actual results were disastrous; they determined the isolation of Russia at a time when she stood greatly in need of technical help from her allies. As an indirect consequence of the Balkan events there was a gradual change in the Russian demands as regard Constantinople. It is interesting to compare the reports of two conversations between the Tsar and the French Ambassador, M. Paleologue. In Nov. 1914, Nicholas II. restricted his claims to the opening and neutralization of the Straits, the expulsion of the Turks from Europe and international administration for Constantinople. In March 1915 he declared that the Russian people were more and more intent on the annexation of Constantinople as the ancient site of orthodox Christianity. Sazonov succeeded in getting from the Western Powers a promise to grant these demands in the hour of victory.

It is superfluous to say that Sazonov was staunch in his fidelity to the Entente and in his opposition to the projects for a separate peace or armistice, which at times cropped up in court circles; he had however, like all other moderate Liberals, the greatest difficulty in resisting the discreditable influences which swayed the Government in its reactionary policy. He opposed as far as he could the assumption of the Army command by the Tsar, as this measure could not effect any improvement in military matters, weakened the home Government and made it more accessible to intrigues. He strongly urged the necessity of winning over the Poles by a real measure of Home Rule, and he seemed to have convinced the Tsar of the necessity of such a measure, but this apparent success was really the occasion of his fall. The Empress Alexandra brought pressure on the Tsar; the measure was countermanded, and Sazonov was dismissed.

He was preparing to start for London as ambassador to succeed Count Benckendorff, when the revolution of March 1917 broke out. He deplored its advent, which brought an end to Russia's participation in the war and plunged the country into an abyss of uncertainty and misfortune. He consented, however, to proceed to London as an envoy of the Provisional Government when the fall of Milyukov and the subsequent degradation of the Government made it necessary for him to step aside. He was again put in charge of the Ministry of Foreign Affairs by Adml. Kolchak, and proceeded to London and Paris in the hope of contributing by his personal authority to win a recognition of the claims of historical Russia from her former allies. Such hopes proved to be in vain. The Peace Treaty of Versailles made only general allusions to the possibility of her reappearance in the

future. Nor was Sazonov the man to curry favour with Estonia, Latvia and Georgia, in order to obtain help, at the cost of a renunciation of the imperial interests of his country. (P. VI.)

**SCAPA FLOW**, an expanse of sea, in the S. of the Orkneys, bounded by Pomona on the N., Burray and South Ronaldshay on the E. and S.E., and Hoy on the W. and S.W. The area contains seven small islands and is about 15 m. in extreme length (N. to S.), and about 8 m. in mean breadth. There are two chief exits—one, 7 m. in length and 2 m. in mean breadth, into the Atlantic Ocean by Hoy Sound, and the other, 3½ m. in length by 2 m. in mean breadth, into the North Sea by Holm Sound. Scapa Flow contains several good anchorages, the best being Longhope in the island of Hoy. When the danger of a war with Germany came first to be apprehended, it was proposed to establish the chief British naval base, in the event of war, at Rosyth in the Firth of Forth, but it was afterwards decided that a larger base in a natural harbour farther N. would be required, and in 1912 it was proposed to construct defences both at Cromarty and at Scapa Flow. Permanent defences at Scapa were, however, abandoned in 1913, owing to the developments of submarine warfare, which rendered it very costly to protect the various entrances. Immediately on the outbreak of war, batteries were erected at Scapa and the Territorial Garrison Artillery of the Orkneys were mobilized to man them. Scapa Flow was preferred to the Cromarty Firth as his chief naval base by Admiral Jellicoe, but no preparations had been made and everything had to be improvised, guns being landed from the ships to strengthen the defences. The absence of preparations came to be felt more strongly with the rapid growth of the submarine menace, for the depth and number of the entrances made it a serious problem to establish adequate defences. By the middle of Oct. 1914, "U" boats were active in the neighbourhood of Scapa Flow, and on Oct. 16, an enemy submarine was reported to be in the Flow. The few capital ships which happened to be there put to sea, and it was recognized that the base would be unsafe until anti-submarine defences were installed. While the necessary operations were in progress, the fleet occupied temporary bases in Skye and Mull and in the defended harbour of Lough Swilly in Ireland, and the absence of the fleet was successfully concealed. By the end of 1914, the entrances of Scapa Flow had been adequately protected, facilities for carrying out all but the most serious repairs were installed, and Scapa Flow gradually assumed the aspect of a great naval station, which it retained to the end of the war. As a precaution against espionage, navigation in the adjacent waters was very severely regulated, and an ever-widening region of the mainland (ultimately extending as far S. as the Caledonian Canal) was proclaimed as a prohibited area. The German ships which were surrendered in Nov. 1918 were interned in Scapa Flow, where on June 21 1919, all the battleships and battle cruisers, with the exception of the battleship "Baden" and five light cruisers, were scuttled. Three light cruisers and some smaller vessels were beached.

**SCARBOROUGH**, England (see 24.301).—The pop. decreased from 38,161 in 1901 to 37,224 in 1911. In 1913 the municipal area was increased from 2,562 to 2,902 acres. The town was bombarded by a squadron of German cruisers on Dec. 16 1914; 18 persons were killed, 84 injured, and damage done to 231 buildings. On April 27 1917, it was ineffectually shelled by submarines, but in a second attack, on Sept. 4 of the same year, 3 persons were killed. The repair of the castle walls and keep, considerably damaged in the bombardment of Dec. 1914, was in progress in 1921.

Excavations of archaeological interest were carried out on the foundations of the old Northstead Manor House at Peasholme, and the remains of the Roman camp on Castle Hill have been bared and opened up. To the amenities of Scarborough were added during 1911-21: a bathing pool measuring 350 by 190 ft. at the foot of the cliff in South Cliff Gardens; a new Floral Hall of Glass in Alexandra Gardens, with accommodation for 1,500 people; Peasholme Park as a public garden, with a boating lake; and the Spa Promenade was extended and a bandstand and large café added. A town-planning scheme was prepared in 1921. Some industrial works were established during the decade, including a piano factory at the Mere, clothing factories, a motor-body works and a colour-printing works.

**SCARFOGLIO, EDOARDO** (1860-1917), Italian journalist, was born at Paganico (Aguila) in 1860, and died at Naples Oct. 6 1917. He was one of the most vigorous and ablest journalists of his time and an excellent newspaper manager as well as editor. He founded the *Corriere di Roma*, the *Corriere di Napoli*, the *Ora* of Palermo and the *Mattino* of Naples. It is with the latter paper, which he owned and edited for many years, that his name is chiefly associated. He was the husband of the novelist Matilde Serao (see 24.661), from whom, however, he had been separated for many years.

**SCHARLIEB, MARY DACOMB** (1845- ), British surgeon, was born in London June 18 1845, the daughter of William Candler Bird. She was educated privately, and married a barrister who was then practising in India. She wished to study medicine, at that time an extremely difficult profession for a woman to adopt, and entered the medical college at Madras, receiving its diploma in 1878. She afterwards went to England and studied at the London School of Medicine for Women, taking her degree as Bachelor of Medicine and Surgery in 1882 with very high honours. In 1883 she returned to India, and became lecturer in midwifery and gynaecology at the Madras Medical College and examiner in the same subjects to the university of Madras. In 1888 she took her London degree of M.D., and from 1887 to 1902 was surgeon at the New Hospital for Women, being senior surgeon from 1889. In 1887 she was appointed lecturer on forensic medicine to the Royal Free Hospital, in 1889 lecturer on midwifery, and in 1902 chief gynaecologist. She retired from these posts in 1909. In 1917 Mrs. Scharlieb was made C.B.E. She was a member of the royal commission on Venereal Diseases (1913-16), and published *A Woman's Words to Women* (1905); *The Mother's Guide* (1905); *The Seven Ages of Woman* (1915); *The Hope of the Future* (1916); *The Welfare of the Expectant Mother* (1919).

**SCHEER, REINHOLD** (1863- ), German admiral and ultimately commander-in-chief of the German battle fleet in the World War, was born Sept. 30 1863 at Obernkirchen in Hesse-Nassau. He served in the German colonial wars in Cameroon and E. Africa and was appointed in 1903 to the command of the 1st Torpedo Division. Subsequently he was for a time at the head of the Central Section in the Imperial Navy Office. In 1913 he was promoted to the rank of vice-admiral and was made commander of the 2nd squadron. In 1916 he was appointed to the command of the German battle fleet (Hochseeflotte). He was in command of the Fleet at the battle of Jutland, and in his book *Deutschland's Hochseeflotte im Weltkrieg* claimed to have won a victory there. In July 1918 he was made chief of the Admiralty staff and again in Aug. of the same year chief in command of the Fleet. In Dec. 1918 he was retired.

**SCHEIDEMANN, PHILIPP** (1865- ), German Social-Democratic leader, was born July 26 1865 at Kassel. He was by trade a printer, but in 1895 took to editing Socialist newspapers, first at Giessen and afterwards successively at Nürnberg, Offenbach and Kassel. In 1903 he was elected member of the Reichstag for the great industrial constituency of Solingen, and in the course of the World War he became the leader of the Social-Democratic party. In his reminiscences of the war period, which he published in 1920 under the title of *Der Zusammenbruch* (The Collapse), he gives an account of the attitude of the Socialist party as a whole at the beginning of the war, and of the change of policy which, to the disappointment of international socialism in other countries, led the German Socialists to give an all but unanimous vote in the Reichstag for the first war credits. He refers to the hurried visit of his Socialist colleague Hermann Müller to Paris on Aug. 1 1914 to discuss the situation with the French Socialists, and the effect of Müller's report, when with great difficulty he had managed to make his way back to Berlin. Scheidemann represented the attitude of the great majority of the Socialists in the Reichstag, if not in the country, by persistently supporting the Government in the main lines of its war policy, up to the months immediately before the so-called "Peace Resolution" of July 19 1917 at any rate. In conjunction with Erzberger he was one of the leading authors of this Resolution, which demanded "peace without annexation or indemnities." Before this date the

improvement in the position of the Socialist party in German political life had been shown by the way in which its leaders, particularly Scheidemann, were frequently called into conference with the imperial chancellor, Bethmann-Hollweg. Scheidemann, in his book, gives a vivid account of some of these conferences, and also of the celebrated interviews which the leaders of parties in turn had with Hindenburg and Ludendorff in Berlin when the army authorities endeavoured to obtain the modification of the so-called "Peace Resolution" before it was produced in public. It was largely owing to the firm attitude taken up by Scheidemann and the Majority Socialists that the chancellorship of the incompetent Michaelis (July to Oct. 1917) was brought to a close. In June 1918 Scheidemann was elected vice-president of the Reichstag, and on Oct. 3, on the formation of the last imperial Ministry by Prince Max of Baden, he received a secretaryship of State without portfolio. The part which he and his associates in the leadership of the Governmental or Majority Socialists played on the eve and on the outbreak of the Revolution was somewhat ambiguous. There is said to be evidence that, while insisting upon the abdication of William II. and the renunciation of the Crown Prince's rights of succession they were prepared to tolerate the continuance of the monarchical form of government in the shape of a regency, with, perhaps, the Crown Prince's eldest son, a young boy, as the prospective monarch. If this be so their plans were speedily brought to naught by the greater vigour of the Minority or Independent Socialists, led by Haase. The Independents had been active in sowing the seeds of revolution among the troops at the front, the sailors at Kiel and Wilhelmshafen, and the workmen in the munitions and other great factories. It was the Independents who forced the hand of Scheidemann and his associates by the arrangements which they had made in Berlin in the first week of Nov. 1918 for a general strike, a demonstration of the masses, and an appeal to the soldiers of the garrison to follow the example which had just been set in Kiel and other northern towns. And it was for this reason that the leaders of the Minority Socialists had to be admitted on equal terms and in equal numbers into the Provisional Government of the "Commissioners of the People," formed on Nov. 10 by Ebert, Scheidemann, Haase and three others. How little Scheidemann's party had been prepared for the course events took was shown by the fact that a proclamation appeared in the Socialist *Verwärts* on Nov. 10, announcing that Prince Max of Baden in resigning the chancellorship had handed over the conduct of affairs to Ebert, who accordingly signed this proclamation as "Imperial Chancellor" (*Reichskanzler*). On Nov. 9, when the revolution in Berlin was slowly and, at first, peacefully spreading throughout the city, it was only after the announcement of the Kaiser's abdication had been published by Prince Max of Baden on his own initiative, at noon, and after the troops which were in occupation of the Reichstag building had thrown their rifles into the Spree and gone home, that Scheidemann appeared in front of that building at two o'clock and dramatically proclaimed the republic.

Scheidemann was closely associated with the policy, alleged to have been inevitable, which led the provisional and, afterwards, the first properly constituted republican Government to retain the services of reactionary officers and troops for the suppression of communist disorders. He was, therefore, together with Ebert and Noske made the subject of violent denunciations, not only by the Communists but also by the Minority Socialists after they had seceded from the Provisional Government at the beginning of Jan. 1919. When the National Constituent Assembly met at Weimar on Feb. 6 1919 Scheidemann was selected as president of the first regularly constituted republican Ministry of the Reich. He guided the affairs of Germany through the stormy period of the first half of 1919, when it repeatedly looked as if the communist insurrections, which broke out in various parts of the country, might result in the overthrow of the democratic republic and in an experiment in some kind of Bolshevism. On July 20 1919, being unable to agree to the signature of the Treaty of Versailles, he resigned with the rest

of his Ministry. He then resumed the leadership of the Majority Socialists in the National Assembly and subsequently in the first republican Reichstag. In Jan. 1920 he was elected chief burgomaster of his native town, Kassel.

**SCHIFF, JACOB HENRY** (1847-1920), American banker and philanthropist, was born at Frankfurt-on-Main, Germany, Jan. 10 1847. He was educated in the schools of Frankfurt and for a time worked in a banking house. In 1865 he went to New York City and two years later organized there the brokerage firm of Budge, Schiff & Co., which was dissolved in 1873. In 1875 he married a daughter of Solomon Loeb, head of the banking firm of Kuhn, Loeb & Co., was taken into the firm and, on Loeb's retirement in 1885, succeeded to the leadership. Meanwhile, largely due to Schiff's energy, the firm had greatly expanded its business and had become known throughout the financial world. In 1897 his house took an active part in reorganizing the Union Pacific railway, which later secured control of the Southern Pacific, assisting E. H. Harriman in these transactions. In 1901 a struggle took place between Schiff and the Harriman interests on the one side and James J. Hill and J. P. Morgan on the other for possession of the Northern Pacific railway. The resulting compromise was the formation of the Northern Securities Co. as a holding company for their joint interests (*see* 27-733). After the outbreak of the Russo-Japanese War in 1904 Schiff introduced Japanese war loans in America and subsequently was decorated by the Mikado. In his later years he gave much personal attention to charities, especially for the Jewish people, and on his seventieth birthday distributed \$700,000 among various charitable organizations and public institutions. He was a founder and president of the Montefiore Home for Chronic Invalids, New York City, and vice-president and trustee of the Baron de Hirsch Fund. In 1903 he presented a Semitic Museum to Harvard. He was vice-president of the N.Y. Chamber of Commerce and a director in many large corporations. He died in New York City Sept. 25 1920. His estate was estimated at about \$50,000,000. He bequeathed \$1,350,000 to various institutions, most of which had received benefactions during his life. The largest bequests were \$500,000 to the Federation for the support of Jewish Philanthropic Societies of New York City and \$300,000 to the Montefiore Home.

**SCHIMMEL, HENDRIK JAN** (1825-1906), Dutch poet and novelist (*see* 24-326), spent his last years in work on spiritualistic research. He died at Bussum in 1906.

**SCHLESWIG.**—The older "Schleswig-Holstein Question" (*see* 24-335) had an important sequel as the result of the World War, in the severing from Germany of part of Northern Schleswig.

The Peace of Vienna of 1864 had set up a joint administration of Schleswig-Holstein by Austria and Prussia. In the Peace of Prague (1866) Austria surrendered to Prussia her claims to both duchies. As regards the administration of Northern Schleswig (Nord Schleswig), an eventual cession to Denmark was reserved if the population should decide in this sense by a free vote. In 1878, however, Austria gave up this reservation, and Denmark in the Treaty of 1907 with Germany recognized that by the agreement between Austria and Prussia the frontier between Prussia and Denmark had finally been determined. The Danish population of Northern Schleswig had, it is true, never acquiesced in this settlement. Propaganda for union with Denmark never ceased, although it had greatly diminished in the years which preceded the World War. At the first elections for the Reichstag the Danes of Northern Schleswig won two seats, but after about 20 years they retained only one of them.

During the World War the movement in Northern Schleswig for separation from Prussia seemed to be in abeyance. It was only the Armistice of 1918, which gave prominence to certain points in President Wilson's programme, that once more inspired among the Danish population a vigorous demand for a plebiscite to decide the nationality of the North-Schleswigers. The Danish Government had at first adopted an attitude of reserve. But from the spring of 1919 onwards a propaganda was conducted in Copenhagen for "South Jutland," the chief leader in the movement being Hansen-Nørremølle, who till then had

been the representative of the Danish population in the German Reichstag. The German Government declared its readiness to apply President Wilson's programme for the "self-determination" of nationalities to the Danish portions of Northern Schleswig. The Treaty of Versailles provided for a plebiscite in that region. The original intention was to take the plebiscite throughout the whole of the Duchy of Schleswig, which for this purpose was to be divided into three zones. Finally, the idea of taking a plebiscite in the most southerly zone was abandoned, as the population of that district was purely German.

Article 109 of the Treaty established two zones for the plebiscite. The northern, or first, zone was bounded on the S. by a line passing through the islands of Röm and Sylt, keeping S. of Tondern, and then running to the N. of Flensburg, through the middle of the Flensburger Fjord, and leaving the island of Alsens to the N. of the line. The second zone included the islands of Sylt and Föhr and ran on, after bulging somewhat to the S. to the Flensburger Fjord on the east. Within this second zone lay Flensburg. The whole of the plebiscitary area had to be evacuated by the German troops and civil authorities within 10 days after the Treaty of Peace came into force. Powers of administration were transferred to an Inter-Allied Commission. In the first zone the plebiscite was to take place, at latest, three weeks after the German evacuation; in the second zone, at latest, five weeks after the plebiscite in the first zone. The decision regarding the assignment of territory to Denmark or to Germany on result of the plebiscite was to be taken on the proposal of the Inter-Allied Commission with due consideration for the special economic and geographical conditions of the region. The Danish Government appointed the former Reichstag deputy Hansen to the post of Danish minister for Schleswig, with the task of maintaining Danish interests in the plebiscitary area. All persons, without distinction of sex, who had completed their twentieth year and either had been born in the plebiscitary area or had lived there before Jan. 1 1900, were entitled to vote. On the German side, a German committee for Schleswig was formed, and was entrusted with German propaganda and preparations for the plebiscite.

On Jan. 15 1920 the Inter-Allied Commission, which had previously assembled at Copenhagen, took over the administration of the plebiscitary area. The German officials had to leave this territory, and their place was taken by native *Landräte* and administrative officials appointed by the Commission. The German troops evacuated the region by Jan. 20. A battalion of British troops was stationed at Flensburg, a French battalion at Hadersleben and another at Sonderburg. The Inter-Allied Commission was composed of Marling (Great Britain), Claudel (France), Heyste (Norway), and von Sydow (Sweden). It promptly issued regulations for the plebiscite, dealing with the voting qualification and the registration of votes. A control over persons entering the plebiscitary area was also established. A vigorous propaganda was initiated both on the Danish and on the German side and led to a number of incidents especially at Flensburg. The plebiscite in the first zone took place on Feb. 10. On the whole it passed off quietly. It resulted in a great Danish majority; 75,151 votes were cast for Denmark and 25,231 for Germany. The larger towns, Tondern, Hoyer, etc., had in all cases a German majority, while the rural population, with the exception of a few German enclaves, voted almost in its entirety Danish. The campaign was much keener in the second zone, where the polling day had been fixed for March 14. There were sharp conflicts, particularly at Flensburg, where the burgomaster, Todsén, was expelled by the Inter-Allied Commission. When a prohibition against the display of flags on the day of the plebiscite was issued on March 6, the German assessors of the Inter-Allied Commission resigned their posts. Repeated collisions with the French troops of occupation took place at Flensburg, and were not unattended by bloodshed. The plebiscite resulted in a great German success; about 51,000 votes were recorded for Germany and only 13,000 for Denmark. There were only two communes which had a Danish majority.

The determination of the frontier took a long time. Germany advocated the so-called Tiedje line, while on the Danish side propaganda was made for the so-called Clausen line. The Council of Ambassadors of the Allies gave its decision at the beginning of June. On June 15 the president of the Paris Peace Conference handed the German delegation a note in which the German-Danish frontier was fixed as follows. It begins at the entrance to the Flensburger Fjord, passes through the middle of that fjord, reaches the mainland immediately to the N. of Flensburg, leaves Flensburg to the S. and then follows a line which reaches the North Sea at Sieltoft. The island of Sylt falls to Germany, the island of Röm to Denmark. On the whole this meant the adoption of the Clausen line. The territory assigned to Denmark was at once handed over to her on June 15, while the territory that remained German was forthwith placed once more under German administration. German troops reentered Flensburg on June 16 after the members of the Inter-Allied Commission had left the town.

The detailed settlement of the territory to be ceded to Denmark was effected by a treaty concluded between Germany and Denmark and signed in the middle of July. At the beginning of July Denmark gradually took over the administration of the ceded districts, the administration of justice being the last department to become Danish. It is worth noting that the day of the plebiscite in the second zone coincided with the *Kapp Putsch* in Berlin. (C. K.\*)

**SCHLICH, SIR WILLIAM** (1840— ), British forestry expert, was born at Darmstadt Feb. 28 1840, and educated there and at the university of Giessen. In 1866 he entered the Indian Forests Department, became conservator of Forests in 1871, and ten years later inspector-general of Forests to the Government of India. He was one of the pioneers of the study of forestry in England, organizing the first school at Cooper's Hill, which was afterwards transferred to Oxford in 1905. He was appointed professor of Forestry at Oxford the same year. Among his books on the subject are *A Manual of Forestry* (1889-95; 3 vols.), and *Forestry in the United Kingdom* (1904). In 1901 he was elected a fellow of the Royal Society, and in 1909 he was created K.C.I.E.

**SCHMOLLER, GUSTAV** (1838-1917), German political economist (see 24.344), died in 1917.

**SCHOLL, AURELIEN** (1833-1902), French author (see 24.356), died in Paris April 16 1902.

**SCHÖNAICH, FRANZ, FREIHERR VON** (1843-1916), Austro-Hungarian general of infantry and Minister of War, was born at Vienna in 1843, and entered the army as a lieutenant in 1861. He spent the greater part of his service on the general staff and on special employments, especially as a chief of sections in the War Ministry. For a short time in command of the IX. Corps he became head of the Austrian Imperial Ministry of Defence, after which he took over the charge of the Imperial War Ministry. Schönaich had an attractive personality, was a practised orator, and well-informed in political matters. Therefore he knew how to maintain good relations with the parliamentary parties, to whom his capacity as an organizer, in the crisis of the winter of 1908-9 (the annexation of Bosnia and Herzegovina), was of great advantage. He was less successful in connexion with the Defence Act of 1911, the financial basis of which he was only able to arrange with important restrictions and serious limitations. In this matter he came into conflict with other influential personages, a circumstance which led to his retirement in the autumn of 1911. During the World War he was in supreme command of the War Provisioning Department, and died at that post in the spring of 1916.

**SCHOUER, JAMES** (1839— ), American lawyer and historian (see 24.377), published in 1913 a seventh volume of his *History of the United States of America Under the Constitution*, covering the period of reconstruction (1865-71). The original plan of his work had been enlarged by the publication in 1899 of a sixth volume, covering the period 1861-5.

**SCHREINER, OLIVE** (c.1862-1920), pen-name of Mrs. Cronwright Schreiner, was born in Basutoland, the daughter of a German missionary sent out by the London missionary

society. She was a sister of W. P. Schreiner, afterwards Prime Minister of Cape Colony, and married in 1894 Mr. S. C. Cronwright, also a S. African politician. Early in 1882, when she was 20 years old, she brought to England the MS. of her first novel, *The Story of an African Farm*, and submitted it first to George Meredith, then reader for Chapman & Hall. He praised the book and suggested certain alterations, most of which she accepted. Eventually it was published by the firm in 1883, over the pseudonym "Ralph Iron." Its success was immediate, but nothing else that she wrote had quite the same literary quality. Her later work includes *Dreams* (1891); *Trooper Peter Halkett of Mashonaland* (1897), a much-criticized attack on the first settlers in Rhodesia; *An English South African's View of the Situation* (1899); and *Woman and Labour* (1911), a fragment of an earlier MS. which had been burnt with other papers during the S. African War. She died at Cape Town in Dec. 1920.

**SCHREINER, WILLIAM PHILIP** (1857–1919), South African lawyer and statesman, the youngest son of a German missionary, was born in the district of Herschel, Cape Colony. He studied law at Cape Town and at Cambridge and London universities. He was called to the bar (Inner Temple) in 1882 and the same year returned to the Cape where he was admitted an advocate of the Supreme Court. He soon attained success and was for many years leader of the Cape bar. In 1893 Schreiner, who had been legal adviser to the High Commissioner since 1887, began his political career as attorney-general in the second Ministry of Cecil Rhodes. He resigned the same year, took the same portfolio again in Sept. 1894 and remained in office until the Jameson Raid brought about the downfall of the Rhodes Ministry. In 1898, having helped to bring about the fall of the Sprigg Ministry, Schreiner became Prime Minister of Cape Colony and held that position when the Anglo-Boer War of 1899–1902 began. During the crisis which preceded the outbreak of hostilities he allowed the passage of armaments to the Dutch republics, and when the war broke out he wished to keep Cape Colony neutral (see 5. 244). Acute differences in the Cabinet caused Schreiner to resign office in June 1900. Later he advocated, unsuccessfully, the federation instead of the unification of the South African colonies. In 1914 he accepted the office of High Commissioner of the Union in London and held that post until his death. He died at Llandrindod Wells on June 28 1919. Schreiner married, in 1884, Frances, sister of F. W. Reitz, President of the Orange Free State. He was a brother of Olive Schreiner, the novelist. Schreiner was a man of high attainments, great industry and impressive speech. His qualities showed at their best at the bar, and the proper crown of his career would have been a seat on the bench. But as a politician he suffered from a lack of suppleness which disqualified him from becoming a popular leader. He had also too much of the cross-bench mind. He was a sincere friend of the natives, and, in 1908–9 successfully defended Dinizulu against the charges of treason and murder brought against him. He also went to London as a delegate of the Coloured Races Political Association to oppose restrictions in the Act of Union.

**SCHULTZ, HERMANN** (1836–1903), German theologian (see 24.382), died in 1903.

**SCHURMAN, JACOB GOULD** (1854– ), American educationist (see 24.386), was appointed in 1912 U.S. minister to Greece and Montenegro, serving one year. During the World War, when Germany began unrestricted submarine warfare, he urged that American rights be firmly insisted upon; he pointed out that the destruction of the "Lusitania" in 1915 threatened to efface the distinction between combatants and non-combatants long recognized by civilized peoples. In 1915 he was first vice-president of the N.Y. State Constitutional Convention. In Oct. 1917 he was appointed a member of the N.Y. State Food Commission, resigning in June 1918 to go to France as lecturer to American soldiers under the auspices of the Y.M.C.A. He was opposed to many of President Wilson's policies, especially in connexion with Mexico, and also to Article X. of the Covenant of the League of Nations, believing that it would involve the United States in war. As early as 1913 he urged the independence

of the Philippines in the near future; in 1914 he declared in favour of woman suffrage. He resigned the presidency of Cornell University in 1920. He was appointed minister to China in 1921. He was the author of *The Balkan Wars 1912–1913* (1914, lectures at Princeton).

**SCHUSTER, SIR ARTHUR** (1851– ), British physicist, was born in Frankfort-on-Main Sept. 12 1851, the son of Francis Joseph Schuster, of Frankfort, who in early life made his home in London, where he carried on a successful business as merchant-banker in Cannon St., his three sons, Ernest Joseph (b.1850), subsequently a well-known lawyer, Arthur, and Felix (see below), being brought up, like himself, as British subjects. Arthur Schuster was educated at Owens College, Manchester, and at Heidelberg University, and devoted himself to a scientific career as an astronomer and mathematical physicist. He was chief of the "Eclipse" expedition to Siam in 1875, and from 1888 to 1907 was professor of physics in Manchester University, his main work for many years being connected with advanced research in spectroscopy, on which subject he contributed the article in the 9th ed. of the *E.B.* in 1887 (as also to the 11th ed. in 1910). He was awarded the royal medal of the Royal Society in 1893, and was one of the secretaries of the Royal Society from 1912 till 1920. He was president of the British Association in 1915, having in 1892 acted as sectional president for astronomy, and he became well known throughout the scientific world, receiving hon. degrees from both Oxford and Cambridge. He was also secretary of the International Research Council, and during the World War, both in that capacity and as a representative of the Royal Society, he did invaluable work as a scientific adviser in connexion with the organization of research in various departments. He was knighted in 1920, and was appointed a member of the royal commission on the universities of Oxford and Cambridge. His numerous publications include works on *Theory of Optics* (2nd ed. 1909), *The Progress of Physics* (1911) and *Britain's Heritage of Science* (1917).

His brother, **SIR FELIX SCHUSTER, Bart.** (1854– ), was also educated at Owens College, Manchester, and studied further abroad, afterwards making his career in London banking. From 1895 he was identified, as governor, with the Union Bank of London, afterwards the Union of London & Smiths Bank, and in 1918 amalgamated with the National Provincial Bank as the National Provincial & Union Bank of England. He was a member of the Council of India from 1906 to 1916, and became chairman both of the Central Association of Bankers and of the Committee of London Clearing Banks. In these years he established for himself a leading position in financial and economic circles, and was made a member of several important Government committees and royal commissions, his annual addresses to the shareholders of his bank being recognized, with those of Sir Edward Holden (of the London, City & Midland Bank), as among the most important contributions of the day to sound thinking on current monetary problems. He was created a baronet in 1906.

**SCHWAB, CHARLES MICHAEL** (1862– ), American capitalist, was born at Williamsburg, Pa., April 18 1862. He was educated in the public schools and at St. Francis College, Loretto, Pa., where he gained an elementary knowledge of engineering. From 1878 to 1880 he was a clerk in a store at Braddock, Pa., and then became a stake driver in the engineering corps of the Edgar Thomson Steel Works of Carnegie Bros. & Co. His ability brought him rapid promotion and in 1881 he was made chief engineer and assistant manager. Six years later he was appointed superintendent of the Homestead Steel Works. In 1889, on the recommendation of Henry Frick, he was made general superintendent of the Edgar Thomson Steel Works, and in 1892, after the formation of the Carnegie Steel Co., he was made also general superintendent of the Homestead Steel Works. In 1897 he was elected president of the Carnegie Steel Co., and when this was merged in 1901 in the U.S. Steel Corp. he was made president of the latter. He resigned in 1903. He then turned his attention to shipbuilding and a few years later with other capitalists secured control of the Bethlehem Steel Corp.,

which owned the Bethlehem Steel Co., and several other corporations engaged in the iron, steel and shipbuilding business. He was made chairman of the board of directors. After the outbreak of the World War in 1914 and before the United States entered it, these companies filled orders for the Allies aggregating between 400 and 500 million dollars. The manufacture of submarines for England raised the question of neutrality, but this was solved by shipping parts to Canada, where they were assembled. It was generally understood that German interests made attempts to secure control of the Bethlehem works in order to shut off munitions from the Allies, and a report that Mr. Schwab was offered \$100,000,000 for his interest was not only widely published but was given prominence in a reception given to him by the New York Chamber of Commerce, and neither then nor at any other time denied by Mr. Schwab. After America's entrance into the war special attention was given to the speeding up of shipbuilding, and in April 1918, at the urgent request of President Wilson, Mr. Schwab became director-general of the shipbuilding board of the Emergency Fleet Corp. His power of rousing enthusiasm among workers by personal contact began immediately to produce results. The resulting output for 1918 was 410 steel vessels (2,570,077 deadweight tonnage), 106 wooden ships (376,480 deadweight tonnage), and 10 composite ships (37,500 deadweight tonnage), a total of 526 vessels. After the signing of the Armistice in Nov. 1918, feeling that his services were no longer required, he resigned from the Emergency Fleet Corp. in Dec. and returned to his position as chairman of the board of directors of the Bethlehem Steel Corp. Later, charges were brought that he had wrongfully used Government money for expenses unrelated to public duties during his tenure of office, but official investigation completely exonerated him. His benefactions include a Catholic church at Loretto, as well as buildings and endowment for St. Francis College; a church at Braddock, Pa., a school at Weatherly, Pa., and a country home on Staten Island, N.Y., for children of the New York Foundling Hospital.

**SCIENTIFIC MANAGEMENT.**—This is one of the names adopted for a certain body of principles and methods of management which have been propounded as applicable to industrial undertakings, other names being Efficiency Engineering and Industrial Management. Developed in the United States, mainly since about 1905, and particularly in connexion with engineering work, the methods of Scientific Management have exercised a profound influence on methods of factory management in England and on the continent of Europe, as well as in America. Though applicable to most of the problems of industrial administration, they have in fact been worked out mainly in connexion with the control of workshop processes.

The theory underlying Scientific Management is briefly that there is "one best way" of doing every act that has to be performed in a workshop, and that it is the duty of the management to discover that "one best way" and to make such arrangements as will ensure that it is always carried out. The method of procedure may be indicated by propounding the following three questions:—

1. What are the factors which limit the speed of a particular workshop process or machine?
2. Why is it that the volume of output from a particular process is always less at the end of the week than the product of the speed of the process or of the machine, multiplied by the working hours in the week, would lead one to expect?
3. Why do some workers produce so much more than others working under the same conditions?

An attempt to discover full answers to these questions leads to very far-reaching inquiries, and radical changes in organization and administrative methods may become necessary if the results of such inquiries are to be put to effective use.

Thus, the investigations prompted by the first question may be expected to lead to modifications of the mechanism and construction of a machine to enable it to run faster; to modifications of tools or appliances used; to changes of the material used for machine parts, for tools or for accessory purposes. Changes in the design of the work to be done might also follow, which, while

leaving the product just as suitable for its purpose as before, would enable the process to be carried out faster. A different method of handling the work, the machine or the tools might be developed, involving a new series of motions on the part of the workman which would result in a saving of time. Not only would specific improvements be made of the kind suggested above, but the effect of each of the many elements which influenced and limited the speed of a process would be reduced to a law, the knowledge of which would save a great deal of experimentation in applying the process to changed conditions.

Investigation of the second question might lead to equally valuable discoveries. For instance, it might be found that the process was stopped altogether for portions of the working week for such reasons as lack of continuous supply of material to be worked on; changes of the "set-up" of a machine due to change in the nature of the work to be done; breakdowns of the machine; adjusting or sharpening of tools; waiting for instructions and many other possible causes. The attempt to remedy these would lead to the development of methods of work-control and planning. These would aim at ensuring that material was always ready to hand to be worked on; that all work of a like nature was carried through at the one time, to avoid needless resetting of machines; that tools and appliances were ready to hand; that instructions as to the next job were prepared and ready in advance; that the nature of each new piece of work was clearly described and so on. Schemes of periodic inspection or adjustment of machines or tools might be indicated in order to reduce time lost through breakdowns.

The third question would lead to the discovery that different workmen had slightly different ways of doing the same thing, and that the ways of the faster workers could be explained to and adopted by the others; that some workers were temperamentally more suited to a particular kind of work than others; that some were not trying; that others were trying too hard and were worrying themselves by their failure; that in some cases the relations between the workmen and the foreman were happy and in other cases not.

The remedying of these troubles would lead to careful methods of choosing workmen for particular jobs, to ensure that men of suitable temperament as well as capacity and skill were employed; to schemes of instruction for showing the worker exactly what was required of him, and for teaching him the methods which had been found to be the best for carrying out the work in question. A scheme of payment by result might be developed, to give the workman the necessary incentive to ensure that he would profit by the instruction given him and would follow the methods laid down. The methods of control, the relationship of the various grades of personnel and the demarcation of the spheres of authority of the various officers of the workshop might also require rearranging, to allow of the foregoing changes and to ensure satisfactory relations between the workmen and those directing them. Built up on the result of such investigations as have been indicated, a variety of systems of management have grown up, one emphasizing one factor and another specializing in another direction, and all known by the general description of Scientific Management.

The origin of the movement is traceable to the work of F. W. Taylor, an American engineer, for many years a manager in the works of the Bethlehem Steel Co., Midvale, Pa. His investigations, leading later to the development of his methods and principles of management, sprang from the attempt on his part to lay down a standard fair day's work and to see that he got it from the men under his control. This led him into a deep analysis of the elements affecting the amount of work that could be done in a given time, and in turn by the kind of steps already indicated to the formulation of his system. One of the largest single pieces of investigation carried through by him was concerned with establishing the laws governing the rate of removal of metal by cutting-tools in a machine. This was carried on at intervals during 26 years. One result of it was the discovery in 1899 of modifications in the composition of tool steel from which the modern high-speed steel was developed. The whole results were

published in 1906 in the *Transactions of the American Society of Mechanical Engineers* under the title "The Art of Cutting Metals." In this Taylor distinguished 12 different factors as influencing the possible speed, and he established formulae expressing the effect which each had on the rate at which metal could be removed during a machining operation. He found that the maximum speed of working could only be attained by a correct adjustment of each variable in relation to all the others. To enable this calculation to be made quickly, one of Taylor's assistants, C. G. Barth, devised a type of compound slide rule, by which the best adjustment of the 12 variables referred to could quickly be found, so establishing the combination of conditions under which the work could be done in the shortest time. An account of these slide rules was published in the *Transactions of the American Society of Mechanical Engineers* (1904). A special slide rule was needed for every variation of every type of machine, and in order to reduce this complication it was necessary to group together all machines capable of doing similar work and to modify them so as to make their movements identical. One calculation and one slide rule would then serve for all the machines of a group. In other words, machines were, where possible, standardized.

To enable maximum cutting speeds to be attained Taylor established, as a result of the foregoing investigation, a set of standard cutting tools for the commonest kinds of machine operations, such as lathe work. These standard tools were specified as to contour of cutting edge, all angles of cutting edge, size of shank and hardening treatment, etc.

Another piece of standardization work resulting from Taylor's investigations was in connexion with the design and use of belt drives. Obviously, if a machine was to be called on to give its maximum performance the means of driving it must be suitable to ensure adequate power. This necessitated an investigation into the laws of power transmission by belting and the drawing up of rules for the standardization both of the material of the belts themselves and of the conditions under which they should be used. One of the most important of these conditions is the tightness of the belt before starting up the drive. Besides laying down suitable rules for this, apparatus was designed for measuring and checking it. Accounts of this work were published by Taylor in 1894 and elaborated by Barth in 1908, both in the *Transactions of the American Society of Mechanical Engineers*.

Concurrently with all this investigation another line of thought had been receiving attention, both from Taylor and others, again mostly in connexion with the engineering trade. This was the problem of obtaining from the workman a higher level of effort than he gave under ordinary methods of workshop management. Although "piece work"—payment by the piece as against payment by the hour or day—was in very general use in many industries, the practice of "cutting the rate" had reduced its efficiency as a stimulus to maximum effort. One of the earliest attempts was the development during the 'eighties by H. R. Towne of the Yale & Towne Mfg. Co., United States, of a scheme called by him "gain sharing," according to which improvements in the efficiency of a works department resulted in the payment to workers in it of a bonus on a prearranged scale. Other plans were the Rowan scheme, which consisted in the fixing of a variable rate per piece, the rate falling according to a fixed scale as the workmen's output rose. By this plan, although the workman benefitted by extra effort, the rate of increase of benefit constantly diminished. The aim was to avoid the temptation to "cut the rate" while still making an attempt to fix a standard of expected output from the workman. This plan was published in 1890.

In 1895 Taylor published his *Differential Piece Rate*, which may be considered to be the basis on which all the multitudinous systems of payment by result of the Scientific Management movement are founded. Taylor's system contained two revolutionary ideas. The first was the careful specification in great detail of the work to be done, with standard times allowed for each element of the work as against the "overall" time hitherto specified for the complete job. The second was the offering of

an increased rate of return to the worker for increases in his efficiency—exactly the opposite to the Rowan plan. This was achieved by offering two alternative piece rates, the lower to apply if the work was done at less than the standard speed and the higher if it were done at the standard speed or faster. The feasibility of this scheme depended entirely on the accuracy with which the "standard time" could be determined. So important did this become that the idea of "time study," with its later development of "motion study," is probably the best-known feature of Scientific Management, and indeed is often taken to be synonymous with it.

Many modifications of Taylor's scheme of payment by result were developed by other workers in the movement. All retained as their basis the setting of a standard time by careful time study, the time being built up of the times for the elements of the work, and the nature of the work to be done and the methods to be followed being specified in great detail. All provided that the rate of incentive should increase at or about the efficiency needed to accomplish the task. The best known of these other schemes are the "Gantt bonus plan" by H. L. Gantt, published in 1901, and that of Harrington Emerson, published in 1909.

It will be realized that the characteristic features of Scientific Management so far touched on—the standardization of appliances and methods, the detailed specification of the work to be done, time and motion study, setting the workmen's task, regulating his payment by his performance of it—all lead to increased complication of management functions.

The material equipment of a works requires special attention to keep it in conformity with the standard. The quality of raw material must be more carefully regulated to enable it to be worked at the standard speeds and on the standard methods. The elimination of waiting between jobs requires elaborate planning of work; the making of time studies is the work of experts; the studies themselves require constant revision to suit changes in design, working methods or material; the incentive to output necessitates systematic inspection of work to ensure the standards of accuracy or finish being maintained. In these and numberless other directions work of a much higher order than hitherto is demanded from the management staff if the system is to function at all.

In order to enable the works management to cope with the new demands made upon it, Taylor devised a new method of administrative organization known as functional control, and applied it particularly to the sphere of the shop foreman.

Under the usual methods of organization a foreman has complete charge of the men under him. All instructions from the higher management pass through him and reach the workman as though they were the foreman's own orders. Taylor's idea was that the instructions which had to be given to the workmen under his system were so much more detailed and elaborate, and dealt with so many more aspects of his work than hitherto, that it became impossible to pass them through a single foreman. It was impossible, he claimed, to find a foreman sufficiently expert in all the sides of the control work or having a sufficiently rich endowment of qualities to carry out the multiplicity of functions now embodied in management. Thus, he would have to be sufficiently skilled at the particular process to teach the men under him how to carry it out; he should have the impartial judgment of an inspector; he must have the assertiveness and force of character needed to get a good day's work out of his men; knowledge of character, sympathy and sense of justice to deal with matters of discipline; he must be methodical and sufficiently versed in clerical and statistical methods to plan out his work and avoid loss of time between one job and another. He must understand costing, methods of handling material, time study and the setting and adjusting of piece or bonus rates, and so on. Because of the obvious impossibility of creating a staff of foremen who should be experts in all these lines, Taylor replaced the single foreman having complete charge of a group of men by a number of "functional foremen," each specializing on one aspect of management control. Each individual workman

would now receive his orders from perhaps half a dozen experts. One told him which job to do next, or in what order to do a series of jobs. Another supplied him with the instructions as to the nature of the work to be done or the article to be worked on. Another told him at what speed to run his machine. Another saw to the upkeep of the machine; another set the piece rate; another judged the quality of the product, and so on. Behind each of these functional foremen was a special department looking after a particular aspect of management, of which he was the mouthpiece, as far as the workman was concerned.

This rigid and literal working-out of Taylor's idea of "management by experts" had usually to be modified in practice on account of the friction and confusion it almost inevitably led to, due to the difficulty of defining sufficiently clearly the sphere of each functional foreman, or to the clash of personalities.

Harrington Emerson embodied the necessary modification of Taylor's scheme in his plan of "Staff and Line" organization, published in 1909. In this the usual chain of executive authority, the "line," was maintained, by which a group of men was wholly answerable to a single foreman, a group of foremen to a departmental manager, several of these to a works manager, and so on. The experts, on the other hand, were collected into special "staff" departments, and their functions were to advise or instruct the "line" officials as to what instructions should be given, or how their work could best be done. This plan gives scope in the line organization for that personal leadership which was fatally destroyed by Taylor's functional foremanship, but still enables the methods of work and the technical policy to be laid down by experts in the various functions.

The last of the three questions propounded at the beginning of this article did not receive the same amount of attention as the other two at the hands of any of the leaders of the Scientific Management school of thought. Taylor in his paper on Shop Management (1903) does, it is true, make a feature of selection of the worker to suit the job, but his ideas in this direction were very different from those of the later school of applied psychology. Taylor's aim was the discovery, by records of individual performance, which men were as a matter of fact most successful in carrying out the task set them. The less successful were to be shown the correct methods of working, but if they still failed to reach the predetermined level of achievement, which was that of a good man, not an average worker, they were to be discharged to make room for others. A follower of Taylor, Dr. Katherine Blackford, made an attempt at selection of the workers beforehand, in distinction to Taylor's selection by trial and error on the job. In her book, *The Job, the Man and the Boss* (1914), she attempted to devise tests which should indicate the capacity of men for various kinds of work, *i.e.* their chance of making good if taken on and given trial. In view of the recent progress of applied psychology in this field, her work is not, however, worthy of serious consideration.

It may be useful to summarize the features embodied in Scientific Management systems as actually applied to an industrial undertaking.

**Standardization** of all machines doing similar work; of all factory equipment, *e.g.* driving and power transmission gear, factory furniture, etc.; of all tools and appliances; of materials to be worked on; of routines; of quality of work, etc. The maintenance of the standards usually necessitates several special departments, *e.g.* for inspection of quality, for upkeep of machines and tools, for dissemination of information, etc.

**Time and Motion Study.**—Time studies are made of the elements of all jobs, as distinct from overall times. Motion study is a development of time study, being an analysis by special methods (including photographic and even cinematographic) of the motions involved in an element of work. From this study motions or parts of motions which are useless are eliminated and the new method taught to the worker. The results of time and motion studies are embodied in written instructions for the use of the worker. These are in considerable detail, covering not only a full description of the work to be done but also of the exact methods of doing it, the tools to be used, the "setting" of the machine, etc., with times for each element both of the machine's work and the work of handling.

**Payment by Result.**—Some schemes of extra payment for the successful performance of the task as laid down in the instruction based on the time study.

**Functional Management.**—This may vary from complete functional foremanship to functional study of methods, technique and procedure, the results being conveyed to the workman via a departmental foreman.

**Planning.**—A special functional department is charged with laying down the order of preference of all work, the sequence of operations or moves through which each job has to pass, the arranging beforehand that all material, tools, appliances, etc., shall be on hand for each job when needed, the conveying of all instructions either to the foreman or to the workman according to the degree of functional management in operation. The planning department is also the central statistical bureau of the factory where all records of the state of advancement of all jobs, of costs, of machines available, often of stores, of men available, etc., are kept.

These features do not exhaust all the functions of management, but may be taken as those which distinguish Scientific Management schemes of organization from earlier types. Of course, certain of these features have been selected and applied in many instances where the full and complete scheme has not been adopted. A scheme which could claim to be ranked among the instances of Scientific Management would, however, include all the above features.

This account would not be complete without some mention of the attitude of labour to Scientific Management. Taylor himself, and later some of his followers, made extravagant claims to the effect that the new methods, by enabling standards of work to be laid down and the worker's achievement to be measured and his exertion rewarded on a prearranged scale, solved the labour problem. Not only has this happy result failed to materialize, but the attitude of labour, suspicious at the outset, has tended to harden into declared antagonism. The extension of the system in America was opposed more and more vigorously as time went on, leading to a serious strike against it in the Watertown Arsenal in 1911.

As a result of growing antagonism the United States Commission on Industrial Relations in 1914 directed that an investigation into the working of Scientific Management should be made, and appointed for this purpose Prof. R. F. Hoxie, of the university of Chicago, with the assistance of a Scientific Management expert and a labour leader. This Commission visited many of the chief establishments in the United States at which Scientific Management was in operation, and its findings are given in Prof. Hoxie's book *Scientific Management and Labor*. Everywhere the investigators found labour antagonistic; the objections which, with minor ones, appear to be fundamental were as follows:—

The system leads to "driving" the worker and to sweating, due to its attempt to speed up all to the speed of the fastest.

The minute splitting up of jobs leads to very much increased specialization of the worker, to the narrowing of his range of skill, and consequently to the destruction of craftsmanship. The work became more monotonous and less satisfying to the worker.

It was claimed that the individual task and reward, and the constant selecting of the fastest workers, destroyed the solidarity of the workers in a factory. The knowledge of a "trade" was no longer necessary to the workmen; all the specialized knowledge having been acquired by the management, the workman had less to sell than previously.

For these and other reasons it was claimed by the workers that the system was anti-social; that it was undemocratic; that it treated the worker as a tool, denied him scope for his personality, and condemned him to endless routine meticulously laid down and arbitrarily enforced.

There can be no doubt that much of the resentment of labour has been aroused by the personality and mental attitude of the Scientific Management experts and the staffs they created in the works which they reorganized, rather than by the fundamental ideas of their system. Their conception of industry was entirely mechanical. Their organizations were ingenious structures of men, machines and routines. Each of these had its place in their buildings, but like steel, brick and cement, though differing in their qualities, all alike were simply building materials, inanimate and obedient to the hand of the builder.

This cast of mind inevitably bred bitter antagonism in labour, and by the year 1921 there was already distinct evidence of a change on the part of the most advanced organizers, both in America and in England. It was significant of this change that Taylor's scheme of functional foremanship had come to be re-

garded as mistaken even by many of his closest followers, who were inclining to believe that in forfeiting the vital factor of personal leadership the loss was greater than could be compensated for by any amount of intensification of expert knowledge. There was a growing tendency too to concentrate study and standardization on the inanimate side of industry, on machines, tools and equipment, on materials and their treatment, on handling methods and appliances, on labour-saving devices, rather than on speeding up and regulating the motions of the worker. The same distinction was seen in the attitude of British labour leaders to Scientific Management. Among the more intellectual leaders the accumulation of more and more of the technical knowledge of an industry in the hands of the management and the more detailed regulation and instruction of the manual worker which results were recognized as inevitable. They were seen to be merely a continuation of the process of replacing hand labour and hand skill by machinery. Such men accepted the need for the application of science to industry as far as the inanimate factors were concerned, and concentrated their antagonism against the treatment of the worker as mere impersonal mechanism.

By the end of the World War some 100-200 American undertakings, largely engineering concerns, had adopted Scientific Management in one or another of its forms, as a complete system. In Great Britain the number of such firms was perhaps one-tenth of those in America, and the positions in France and Germany were perhaps less advanced still. The influence of the movement, however, cannot be estimated by any such figures. For every concern that had adopted the system in its entirety there were 10 or 20 that had adopted portions of it, or had modified their previous methods of management under the influence of ideas first given prominence by the Scientific Management school. The conception of "the one best way," the belief that every act, every relation and every implement of industry is worthy of close and systematic study, has provided an inspiration and a stimulus to management methods in all industries and in every country, the effect of which can hardly be less than that of the introduction into industry of machinery a hundred years ago.

(C. G. R.)

**SCOTLAND** (see 24.412\*).—The history of Scotland from 1010 to 1921 resolves itself largely into the effect of the World War (1914-9) and of the conclusion of peace upon industry and commerce. In the history of actual military operations, Scotland played, naturally, a small part, although for the first time in the history of Great Britain as a sea-power, the main activities of the fleet took place in Scottish waters. Zeppelins attacked Edinburgh and the E. coast on April 2 1916. On May 2, in the course of a raid which was upon an unusually large scale, but had very slight results, a Zeppelin (L20) missed Edinburgh and sailed as far N. as Aberdeenshire, where it dropped bombs which fell harmlessly on fields. Another fruitless expedition to the S.E. of Scotland took place on Aug. 9 1916; the raiders got into thick weather and their bombs were dropped in rural areas. On May 15 1918, St. Kilda was bombarded by a German submarine and damage was done to the church and some other buildings. The surrender of the German fleet is the only other operation definitely associated with Scotland. German naval emissaries arrived in the Firth of Forth on Nov. 15 1918, and the surrender began on Nov. 21. It was in Scapa Flow that the crews of 70 German warships scuttled their ships on June 21 1919.

The part played by Scotland in supplying man-power and in providing munitions of war was worthy of the national tradition. The Scottish recruiting record in the period preceding the introduction of compulsory service will compare with that of any other portion of the United Kingdom, and Scottish industries, like those of England and Wales, were directed to the production of war material. The Clyde, naturally, took a large part in naval construction and repairs, and all over Scotland, munition factories came into existence. In the naval warfare, the E. coast of Scotland was of great strategic importance.

Apart from the war and its effects, the ten years witnessed few important internal events or movements. Trade and com-

merce were frequently interrupted by strikes, but the only serious riots took place in Glasgow on Jan. 31 1919, when considerable damage was done to buildings. Political interests, before the war, pursued their traditional course, and in the general election of Dec. 1910, Scotland returned 58 Liberal, 11 Unionist, and 3 Labour or Socialist members. By the date of the Armistice, party politics had undergone a complete transformation, and, at the general election of Dec. 1918, Scotland, which by the Reform Act of 1918 received two additional members, returned 58 supporters of the Coalition, 7 Independent Liberals, 7 Labour representatives and 2 Independents. A feature of the period has been the large number of state visits paid by King George and Queen Mary. An Accession Court was held at Holyrood in June 1910, and, a year later, the King dedicated the new chapel of the Thistle in St. Giles's cathedral, Edinburgh. Royal visits to Edinburgh, Glasgow, Dundee, Perth and Stirling took place in July 1914. During the war, the King paid some private visits to centres of munition industries, and the programme of state visits was resumed in July 1920, when the King and Queen held a Court at Holyrood, and in their yachts visited the Clyde during the regatta known as the "Clyde Fortnight."

In church affairs, the most important events have been the issue in 1910 of the final Report of the Royal Commission appointed under the Churches (Scotland) Act of 1905, allocating the property of the old Free Church between the United Free Church and the Free Church, and the series of negotiations for union between the Church of Scotland and the United Free Church, which became a matter of practical politics after the discussions in the Assemblies of 1912 and had advanced so far by 1919 that, on Dec. 17, the commission of the Assembly of the Church of Scotland agreed to approach the Government with a view to carrying a bill through Parliament.

The recent growth of a keener appreciation of the value of historical records and monuments is illustrated by the enactment in 1913 of the Ancient Monuments Consolidation and Amendment Act, by the work done by the Royal Commission on Ancient Monuments, originally appointed in 1908, and by the gift of four great historical buildings to the nation. In 1918, Lord Glenconner presented Dryburgh Abbey to the nation, and in the same year the Duke of Buccleuch followed his example by the gift of Melrose Abbey. In 1919, the Duke of Roxburghe made an arrangement with the Commissioners of Public Works and Buildings by which Kelso Abbey became a national monument and is maintained by the State, and in 1920 Col. Hall Dempster placed Restenneth Priory (Forfarshire) in the charge of the Commissioners of Works for national guardianship and for the benefit of the nation. On the other hand, by an outrage attributed to suffragettes, Scotland lost on Feb. 26 1914 the church of Whitekirk (Haddingtonshire), one of the few beautiful pre-Reformation churches surviving.

Two important centenary celebrations took place in the period—the quin-centenary of the foundation of the university of St. Andrews, held in 1911, when Lord Rosebery was installed as Lord Rector and made a famous oration, and the sex-centenary of the victory of Bannockburn (June 24 1314), which was celebrated by a procession and a banquet at Stirling on June 27 1914, when Sir George Douglas delivered the address. The town council of Aberdeen commemorated the quin-centenary of the battle of Harlaw, fought in 1411, and the town council of Arbroath, in Sept. 1920, held a patriotic and religious service to celebrate the sex-centenary of a famous assertion of the independence of Scotland in a letter addressed to the Pope by a Parliament which met in the abbey at Arbroath in 1320.

More practical evidence of renewed interest in Scottish history was given by the success of the Scottish Historical Exhibition at Glasgow, opened by the Duke of Connaught in May 1911, the proceeds of which formed the main endowment of a Chair of Scottish History and Literature founded in the university of Glasgow in 1913.

The demand for some form of Scottish Home Rule has been insistently pressed by its advocates since 1910 but there has been no evidence of any wide-spread feeling on the topic, apart

\* These figures indicate the volume and page number of the previous article.

from the more general question of the adoption of a system of Devolution for the United Kingdom, a suggestion which received much parliamentary support in the years 1918-20.

Apart from the extensions of Edinburgh and Glasgow, the most important municipal event is the amalgamation, in 1920, of Motherwell (about 42,860 inhabitants) with Wishaw (about 27,484 inhabitants) to form a single municipality known as Motherwell and Wishaw.

**Legislation.**—In addition to the emergency war legislation which affected Scotland equally with England the decade 1911-20 was marked by a series of important legislative enactments, intimately affecting the political and social life of the country. A vast change was made in the parliamentary electorate by the Representation of the People Act of 1918, which increased the number of voters (counties, burghs and universities) from 800,448 at the general election of Dec. 1910, to 2,211,178 at the general election held in Dec. 1918. The Fourth Reform Act (1918) not only made a wide extension of the franchise; it also, by its redistribution of the constituencies, severed the last link with the old tradition of Scottish parliamentary representation as it existed before the union. The shire ceased to be the unit of county representation, and the old Scottish system of separate burghal representation was abandoned. The burghesses had sat in the Scottish Parliament, as a separate estate, from a much earlier period than the commissioners of shires, and the royal burghs, which they represented, had special trading privileges which distinguished their interests from those of the counties in which they were situated. The principle, adopted in 1707, of grouping together small burghs, sometimes geographically distant, as separate constituencies, was retained in 1832, 1868 and 1885; e.g. the inland burgh of Elgin voted with the distant seaport of Peterhead, instead of forming part of the constituency of Morayshire. In 1918 the burgh of Perth, which had enjoyed separate representation, and eight groups or districts of burghs were merged in county constituencies; six districts of burghs still exist, but the constituent members of each group are in close geographical proximity. The last vestiges of the privileges of royal burghs, in which the distinctively Scottish system of distribution originated, had been removed as long ago as 1846.

The other important Acts of the period may be described as social legislation, dealing with housing and provision for medical attendance, land questions, temperance and education. An Act of 1909 had extended to Scotland the Housing of Working Classes Acts, 1900-3, with certain modifications, and had given powers to local authorities, with the consent of the Scottish Local Government Board, for the compulsory acquirement of land; for the borrowing of money from the Public Works Loan Commissioners to provide working-class dwelling-houses; and for the execution of town-planning schemes. The shortage of houses which became a serious social danger after the war, not only led to various emergency Acts limiting rents and mortgage interest and severely restricting the powers of landlords to terminate existing tenancies, but was also one of the causes of the creation of a Scottish Board of Health by an Act of 1919. The powers and duties of the Local Government Board for Scotland, and the Scottish Insurance Commissioners and also some powers of the Privy Council conferred by a large variety of recent Acts, were transferred to the Board of Health, which was entrusted with the execution of all measures conducive to the health of the people. A Housing (Scotland) Act of the same year (9 & 10 Geo. V, C. 60) gave to the new Board of Health the supervision of the schemes of local authorities for the provision of working-class dwellings, and empowered it, in the event of the failure of local authorities to prepare schemes, to make a public inquiry in any such locality and to arrange for the preparation of a scheme. The Act made provision for financial assistance (under the supervision of the Board of Health) to local authorities, public utility societies, and housing trusts, for the building of houses, largely increased the powers of local authorities as regards compulsory purchase, and made it compulsory for them to prepare town-planning schemes. Other measures affecting public health which were passed during the decade were the Highlands and Islands (Medical Service) Grant Act of 1913, which created an annual grant of £42,000 for the improvement of medical services and nursing in the Highlands and Islands; and the Midwives (Scotland) Act of 1915, which provided for the training and certification of midwives. The powers granted to the Privy Council under these two Acts are among those transferred to the Board of Health. The first Annual Report of the Board of Health (for the year 1919) showed that 212 housing schemes had been submitted by local authorities, providing for the erection of 112,573 houses, the total pop. represented by the authorities being 4,169,501. The report brought out the interesting point that, even in localities which are near stone quarries, the cost of building in stone exceeded, by a considerable sum, the cost of building in brick.

A very important measure dealing with land was passed in 1911. By the Small Landholders (Scotland) Act, the Scottish Land Court and the Board of Agriculture for Scotland were constituted, and the provisions of the earlier Crofters Acts were extended to other small landholders, and were amended in various respects. A dignified

status was given to the Land Court by a provision that its chairman should enjoy the same rank and tenure of office as a judge of the Court of Session. The powers of the Board of Agriculture and Fisheries, under previous statutes, were distributed between the Board of Agriculture and the Board of Fisheries, and an Agricultural (Scotland) Fund was created for the establishment, enlargement and improvement of small holdings. Disputes between landlords and the Board of Agriculture are settled in the Land Court, which also determines the amount payable to landowners as compensation for permanent improvements, fixes rents in certain cases and prescribes regulations for pasture, grazing and common rights. The decisions of the Land Court are not subject to review by other courts, though the Court of Session may be consulted by the Land Court on questions of law. The first Report of the Land Court, for the nine months ending Dec. 31 1912, showed that 2,434 applications for small holdings had been received, and that 256 had been decided, the total rents, in these cases, being reduced from £2,226 16s. to £1,568 2s. and arrears of rent amounting to £1,721 14s. being reduced to £771 19s. In 1919, "fair rents" were fixed for 170 holdings, the average reduction of rent being 10%, and 275 holdings were re-valued, at the expiry of seven years from the fixing of a "fair rent"; the original rents of these holdings amounted to £2,823, the first "fair rents" to £1,927, and the rents fixed in 1919 to £2,058, representing an increase of over 68% on the previous decisions—an indication of the improvement in the value of land. Further provision for the acquisition of land for the purposes of small holdings was made by the Land Settlement (Scotland) Act of 1919 (9 & 10 Geo. V, C. 97), which also amended the Small Landowners Act of 1911. Fresh powers were given to the Board of Agriculture by the removal of restrictions as to total area to be acquired and as to methods of purchasing or taking land on lease or feu, and by widening the range of its activities. A large series of statutes for crofts and small holdings is now in operation, and the Land Court in its 1919 Report drew attention to the urgent necessity for their codification in order to remove ambiguities, inconsistencies, and difficulties of interpretation. Less important measures dealing with land were the Feudal Casualties Act of 1914, for providing for the redemption of duplicands and grassums (entry fees) and other sums payable by feu-holders to their superiors at intervals of more than a year; the Entail (Scotland) Act of 1914 restricting the possibilities of future entails of land or property; and the Duplicands of Feuduties (Scotland) Act of 1920, passed to reverse the effect of a decision of the House of Lords in 1919 that a "duplicand" payment of a feuduty means, unless otherwise defined in a deed, the payment of double the regular feuduty in addition to the ordinary annual payment. The Act defines a duplicand, in accordance with what has been the traditional usage, as "one year's feuduty only over and above the feuduty for the year." The prevalence of the system of feus in Scotland rendered the legal decision a matter of considerable importance.

**Liquor Licensing.**—The Temperance Act (Scotland) 1913 provided that, on the Act's coming into force in June 1920, local authorities should, on the receipt of signed requisitions from electors in their areas, take a poll on three alternative resolutions dealing with the number of licenses in an area. The resolutions were (1) that there should be no change in the system of licensing, (2) that the licensing court should grant not more than 75% of the licenses previously in force and (3) that no license should be granted within the area, except, in special circumstances, to *bona fide* hotel and restaurant keepers, who might be allowed to sell drink in retail to residents in hotels or to persons taking meals at restaurants. The areas were defined as burghs of a pop. not exceeding 25,000; separate wards in larger burghs, and parishes in the counties. The voters were defined as electors to town councils in burghs and electors to parish councils in the counties. Each voter could vote for only one resolution, but, where a no-license resolution was not carried, the votes given for no-license were to be added to the votes given for limitation of licenses. A no-license resolution was to require 55% of the recorded votes in a poll of not less than 35% of the electors, in order to be carried; a limitation resolution required a bare majority vote in a poll of the same size. Polls were held in Nov. and Dec. 1920, in 580 out of 1,221 polling areas; of the remainder, about 300 were areas in which no license existed, and in the rest no requisitions were submitted for a poll. The polls took place in all the towns and in the more thickly populated rural districts. Five hundred and nine areas voted for no change, 35 for limitation of licenses, and 40 for no license. The total numbers of votes were—708,727 (66%) for no change, 19,400 (1.6%) for limitation; and 453,728 (38.4%) for no license. In Glasgow, four wards (Campbell, Cathcart, Pollokshields and Whiteinch) voted for no license, and nine wards for limitation; in Edinburgh, Dundee and Aberdeen no change was carried in every ward. There were in Nov. 1920, 9,371 licensed premises in Scotland, of which 1,471 were hotels or inns, 4,847 were public-houses and 3,053 were grocers' shops. The reduction made in May 1921, in accordance with the result of the polls, involved the extinction of about 450 licenses, a majority being in urban areas, where middle-class residential districts voted for the abolition or reduction of licenses. Glasgow contributed 99 to the total number of withdrawals of licenses, but these were chiefly in the residential districts already named or in other residential districts like Govanhill, Kelvinside, Park and Pollokshaws, in which there was an unusually

large proportion of grocers' licenses. Among the smaller towns which "went dry" were Buckie, Cullen, Kirkintilloch, Sanquhar, Lerwick, Stornoway, Stromness and Wick. The contest was fought by the Temperance party on a prohibition programme, and its influence was thrown against the limitation resolution; the result was, therefore, rather a repudiation of prohibition than an indication of satisfaction with existing licensing conditions. The Act of 1913 provided for further polls, on a requisition by electors, in Nov. and Dec. 1923, but the experience of the poll of 1920 made it clear that modifications were required in the Act, especially in the definition of an "area" as a single ward in the larger burghs, which must be treated as a whole in order to secure that any reduction of licenses shall be more equally distributed than was possible in 1920.

**Education.**—A large amount of attention has been devoted to education, with a corresponding increase in public expenditure, both national and local. The English Education Act of 1918, which marks an era in State provision for education, was accompanied by the Education (Scotland) Act of the same year. The Act swept away the system of school-boards, created in 1872, in favour of the principle of a larger area for educational administration than a parish. The new administrative body created by the Act is known by the awkward name of an Educational Authority. Five large burghs, Edinburgh, Glasgow, Aberdeen, Dundee and Leith, were made separate educational areas; the number has since been reduced to four by the amalgamation of Leith with Edinburgh. Elsewhere, the area is the county, including the burghs within its bounds, and the Secretary for Scotland was empowered to make, by order, electoral divisions within the areas, to define the number of members of each educational authority, and to apportion the representatives among the divisions of the area. Electors to educational authorities are the persons registered as local government electors under the Representation of the People Act (1918). Voting is conducted on the principle of proportional representation; each elector has one transferable vote. School management committees, acting under an education authority and including representatives of parents and of teachers, exercise general powers of supervision and management, but have no control over finance, or over the appointment or dismissal of teachers. Education authorities are empowered to expend public money not only on the maintenance of schools but also on the provision of food and of books for the children (including books for general reading), and they may make grants to pay travelling expenses of young persons resident at a distance from the nearest intermediary or secondary school, and may give assistance to a qualified person attending a university or training college. They are bound to provide free primary, intermediary and secondary education in all districts, but may maintain a limited number of fee-paying schools and may also make contributions to certain schools not under their jurisdiction. Religious instruction may be given in the schools, but no child whose parents object to such instruction is thereby to lose any other advantage of the school. Voluntary or denominational schools may be (and nearly all have been) transferred to educational authorities and managed as public schools, their teachers being appointed by the local authority and approved as to character and religious belief by representatives of the church or body by whom the school was conducted. In such transferred schools, the time devoted to religious instruction is not less than it was under the former management. Voluntary schools, not thus transferred, are not eligible for grants from the Education Fund; new voluntary schools may be established by educational authorities under conditions similar to those affecting transferred schools. An educational authority administers the Education Fund of the area, arising from Government grants or loans, supplemented by its own education rate, which is fixed by the authority and levied by the parish councils of the area. The Act also extended the school age to 15 years and severely limited the employment of children of school age, prohibiting the employment of children under 15 in factories, workshops, mines or quarries, and forbidding street trading by persons under seventeen. A system of continuation schools was also provided for. An attendance of 320 hours annually in a continuation school may be required from all young persons up to the age of 18, unless their education is otherwise provided for, and instruction in such schools is to include English and general education, instruction for special forms of employment, and physical culture; when the scheme comes into operation, employers will be bound to afford facilities for an attendance of 320 hours, exclusive of hours between 7 P.M. and 8 A.M., unless hours within these limits are sanctioned by the Scottish Education Department, the approval of which is also required for the exercise of a large number of the powers conferred by the Act.

The operation of the Act of 1918, contemporaneously with a large increase in the salaries of teachers, has resulted in a vast increase of expenditure. The estimate for ordinary public education in Scotland for the year ending March 31 1911, was £2,253,725, and for the year ending March 31 1921, £6,877,220, and to this increase have to be added the large sums raised by local rates, which have risen proportionally. The system of assessment, based on house rent, and divided, in almost equal proportions, between proprietor and tenant, is generally regarded as being no longer suitable to the circumstances, the value of the house occupied by a ratepayer not affording a satisfactory test of his ability to pay, and a demand has been made for

the substitution of a local income tax; some reform of the system of local rates has been promised by the Secretary for Scotland. In addition to State grants for elementary and secondary education, financial assistance to the Scottish universities has been increased from an estimate of £93,000 in the year ending March 31 1911 to an estimate of £195,000 for the year ending March 31 1921, besides a share of a non-recurring grant to universities and other institutions adversely affected by the war. Private benefactions, including grants from the Carnegie Trustees, have provided funds for the institution of new chairs and lectureships in all the universities, including chairs of Scottish History and Literature, French, German, Bacteriology, Organic Chemistry, Physiological Chemistry, Mercantile Law and Engineering at Glasgow; chairs of Agriculture and Political Economy at Aberdeen; and chairs of French, German, Accounting and Business Method, Chemistry in relation to Medicine, Zoology, Forestry, Clinical Medicine, Bacteriology, Tuberculosis, Therapeutics and Psychiatry at Edinburgh.

Evidence as to social conditions is available in reports of Government departments. The Mental Deficiency and Lunacy (Scotland) Act of 1913 reconstituted the existing Commissioners of Lunacy as a General Board of Control and amended the Lunacy Laws. The Board's first Annual Report (for 1914) showed that there were 19,557 insane persons in Scotland, of whom 16,870 were paupers. In 1919 the total was 17,580, of whom 14,562 were paupers. The latest Report of the Board draws attention to the decrease, pointing out that the average total for the five years from 1911 to 1915 was 18,537, and for the five years 1916-20, 18,132, and remarks that "it may be assumed that but for the influence of the war the numbers in the last quinquennium would have been at least 19,883 instead of 18,132." The Prison Commissioners, in their Report for 1919, state that the influence of war conditions was ceasing to operate at the end of that year. The total number of persons committed to prison in 1918 was 9,773 as compared with 14,505 in 1917 and 43,535 in 1914. The figures for 1918 are the lowest on record; there was a continued decrease in the first four months of 1919, but the total number of commitments for that year was 11,725; similarly, the judicial statistics for 1919 show an increase of 26.9% in the number of persons dealt with in criminal courts, as compared with the previous year, the numbers being 80,152 in 1918 and 101,687 in 1919. The total for 1911 was 155,537. The most satisfactory feature of the year 1919 was a decrease (from 10,772 to 9,176) in the number of persons dealt with in juvenile courts, as compared with 1918; the numbers of such persons had risen during the war from 10,761 in 1911 to 11,851 in 1915 and 12,180 in 1917, a result attributed to the absence of paternal control during the war years.

**Shipbuilding.**—The figures of production in Scottish shipbuilding for 1911 represented a considerable increase over 1909 and 1910, the number of vessels being 557 in 1911 against 450 in 1910, and the tonnage 671,624 against 420,250. These numbers exceeded the previous record of production—757 vessels with a tonnage of 675,173 in 1907—because the I.H.P. (indicated horse power) figures were 742,299 in 1907 and 837,668 in 1911. The output for 1911 consisted chiefly of vessels of moderate size, and the types of vessels were very varied. The main increase was, naturally, in the Clyde area; the E. coast shipbuilding areas (the Forth, the Tay, the Dee and the Moray Firth) produced 144 vessels with a tonnage of 41,041 and I.H.P. 47,739—an increase of 13,183 tons and 17,311 I.H.P. upon 1910. In 1912, a fresh record was created, the total Scottish tonnage being 688,188, with I.H.P. 914,741, and in 1913 the figures rose to a tonnage of 809,711 and I.H.P. 1,148,225. The Clyde output for 1913 was more than double that of any other British shipbuilding area except the Tyne, and it exceeded the output of the Tyne by 317,000 tons; the advance since 1910 was the most remarkable in the whole history of Clyde shipbuilding, for the tonnage of 1910 had been nearly doubled in 1913; but the increasing cost of production caused some anxiety about the future. Among the larger vessels built before the outbreak of war were H.M.S. "Conqueror," the largest battleship yet built on the Clyde, which was launched in 1911, and the liner "Aquitania," the largest vessel then built for the merchant service (tonnage 45,600, speed 23 knots), which was launched in 1913. In the seven months of 1914 which preceded the outbreak of war, the output showed a continuous decrease, and a period of depression was believed to be at hand, and from Aug. three of the largest yards had to devote practically their whole attention to naval construction. The total tonnage as published for 1914 was 460,258 with I.H.P. 496,120, but these figures are exclusive of the construction of warships and must be compared with the 1913 figures for mercantile construction, viz.: 692,601 tons with I.H.P. 649,240—a decrease of 232,343 tons and 153,120 I.H.P. The naval figures, now available, show that the outbreak of war had not merely checked the depression but had produced a fresh "boom" in Scottish shipbuilding. In 1915 mercantile construction amounted to a tonnage of 233,501, with I.H.P. 205,288—figures not far below the U.S.A. construction for the year—although the yards were almost entirely controlled by Government, and merchant work was neglected. No separate Scottish figures for 1916 were published until after the close of the war, and, in 1917, the mercantile tonnage for the United Kingdom was a state secret. Mercantile construction had been, to a large extent, in abeyance until the end of 1916, but great activity was shown in this

department in 1917 and 1918. The totals (including naval construction) for the five war years were:—

	Vessels	Tonnage	I.H.P.
1914	481	591,396	1,192,347
1915	386	331,410	1,231,043
1916	477	541,527	1,898,044
1917	517	502,875	1,628,950
1918	585	613,709	1,958,944

In no one of the war years did the tonnage approach that of 1913, but this is explained by the circumstance that the proportion of tonnage to I.H.P. is much smaller in naval than in mercantile construction, and the 1913 I.H.P. figures were exceeded in every year of the war. In the war years, the volume of naval repairs was also very great.

In 1919 the tonnage figures of Scottish yards rose to 729,490 with I.H.P. 1,590,894, and in 1920 to 778,914, with I.H.P. 673,040; the figures relate entirely to mercantile shipping, as naval construction was stopped. The increase of tonnage over 1918 was in the building of many cargo steamers, the average size of which was greater than before the war, and the decrease in new machinery indicated in the I.H.P. figures is explained by the circumstances that such steamers are of comparatively low power. Judged by the test of tonnage, the output for 1920 was not far below that of 1913, although the machinery installed was not much more than half; compared with the purely mercantile output of 1913, both the tonnage and the I.H.P. figures were larger in 1920, and the year ranked as second only to 1913, but the prospects for the future were very poor.

**Shipping.**—The year 1911 was marked by a rise in freights which continued throughout 1912 and the first half of 1913, but in the end of that year there was something like a collapse, and the "slump" continued until the outbreak of war, when a temporary suspension of chartering was followed by a very sharp rise in freights which continued, progressively until Government control began, in 1917. A further rise took place at the beginning of 1918 in order to cover Government liability for losses in tonnage through sinkings. The reorganization of Scottish shipping, after the interruption of the war, did not make much progress until the latter half of 1919, owing to the necessities of demobilization; and the process of reorganization was hampered in 1920 by labour troubles and especially by the uncertainty of the export coal trade. Freights continued to be high in the early part of the year, but even high rates proved to be unprofitable in view of the cost of coal and of labour and rises in harbour tolls, stevedoring, and insurance premiums; and in the end of the year there was a "slump" in freights. The effect of the war may be traced in the decrease in the total number of vessels registered in Scottish ports. In 1914 there were 494 sailing vessels, with net tonnage 153,323 and 3,441 steam vessels with net tonnage 2,675,720—a total of 3,935 vessels with net tonnage 2,829,043. In 1918 there were 354 sailing vessels with net tonnage 82,181 and 2,759 steam vessels with net tonnage 1,797,907—a total of 3,113 vessels with net tonnage 1,880,088, the decrease in tonnage being constant and progressive until 1918, in which year there was a check to the rate of the downward movement. The decrease in net tonnage registered in Scottish ports was 172,134 in 1915, 232,994 in 1916, 389,183 in 1917 and 154,644 in 1918, the figures in each case representing the decrease on those of the previous year. Statistics showing the recovery in 1919 and 1920 were not available in Feb. 1921. The following table shows the effects of the war and of the first year of peace upon the imports and exports of merchandise at Scottish ports:—

	1911	1915	1917	1918	1919
Imports in £ . . . . .	46,937,758	58,442,334	76,970,468	109,343,866	112,631,887
British and Irish Exports . . . . .	46,683,953	38,242,899	44,048,744	32,333,700	69,661,877
Foreign and Colonial Exports . . . . .	677,301	1,442,711	1,025,380	526,349	6,146,906
Total in £ . . . . .	94,299,012	98,127,944	122,044,592	142,203,915	188,440,670

**Coal.**—The table at the foot of the page shows the output of Scottish coal in the decade.

The export trade before the war was amounted in round numbers to 16,000,000 tons per annum, of which 6,500,000 represented bunker coal and coal shipped to home ports. The outbreak of war at once closed markets in Germany, Austria, Russia, and Turkey, and interrupted trade with other countries. The effect was specially felt in

the E. of Scotland, which is largely dependent on overseas trade. Exports further decreased from 1915 to 1917. In 1918 they amounted to 7,460,000 tons, or about 45% of the pre-war average, but, in the end of that year, shipments to foreign countries were almost entirely suspended, owing to the demand for bunker coal and for coal for Admiralty and home use. Exports were specially low in the Forth area because the ports of Bo'ness, Grangemouth, Granton, and Burntisland were largely or entirely requisitioned by the Admiralty. In 1920 the coal controller, to safeguard an expanding home demand, placed very severe restrictions upon exports; and Scottish exports, in the first ten months of that year, amounted to 1,156,475 tons as compared with 2,129,059 tons in the first ten months of 1919; these figures are exclusive of bunker coal. Total output was reduced by strikes in 1912 and in 1920, and, during the war, by shortage of labour. Prices were low at the beginning of 1911 and fell in the first half of the year, but, by the beginning of 1912, they showed an advance of from 1s. to 2s. per ton in all classes of fuel. Prices remained high in 1912 and rose in 1913; they varied at different periods in 1914, and the advance of recent years began in 1915, although there were remarkable fluctuations in 1916. Maximum retail prices were fixed for home consumption in 1917. After the Armistice, prices advanced rapidly in the second half of 1919, and the supply was unequal to the demand. Export prices reached an unprecedented level in 1920, but the beginning of 1921 witnessed a "slump" in exports. Before the war, the Scottish coal trade had to face German competition. At one time, Germany was an important market for Scottish coal, but exports to Germany had fallen to under 3,000,000 tons, and German coal was competing with Scottish coal in foreign markets. New markets were, however, being opened up, and from 1911-4 Fife coal was developing large exports to S. America. A new dock at Methil, built principally for this trade by the North British Railway Co. (at a cost of nearly £1,000,000), was opened in 1913.

**Iron and Steel.**—In spite of a temporary decline in the price of hematite pig-iron and steel scrap in 1911, the decade opened well for the steel and iron trades. There was an increase in steel exports in 1911 and it was maintained, in spite of the coal strike, in 1912, and in the first half of 1913; but German competition was severely felt both in home and in Japanese, Canadian and Indian markets. In 1914 both the pig-iron trade and the steel trade were inactive, but a rapid improvement followed the outbreak of war, and steel and malleable iron continued to be in great demand throughout the war. The pig-iron market, on the other hand, suffered in 1915 from an unprecedented advance in the price of ore and from freight difficulties. Early in 1916 all the works in which pig-iron was produced were placed under the Ministry of Munitions, and there was a steady demand in spite of reduced exports. The pressure of work in the steel and iron trades continued after the decontrol of steel in Jan. 1919 and of iron in the following April, and prices were high. In the end of the year steel ship-plates were £19 15s., boiler ship-plates £24 10s., and angles £19 5s., net per ton delivered on the Clyde, as compared with £7 2s. 6d., £7 17s. 6d., and £6 15s., respectively, the highest prices in 1911. Hematite iron rose to 210s. per ton as compared with 72s., the highest price in 1911. Prices reached still higher levels in 1920, demand far exceeding supply in the earlier part of the year, but prices proved to be too high for remunerative trade, and reductions were made in November. Imports of pig-iron from France and Belgium were begun, but in quantities so small that competition with Scottish production had not yet become serious.

**Mineral Oil.**—The Scottish mineral oil trade, the centre of which is W. Lothian, was suffering severely from foreign competition in the

years immediately preceding the war. Low prices and decreased dividends marked the year 1911; there was a revival in 1912, due partly to the general "boom" in trade and partly to the opening up of wider markets, and 1913 was also prosperous in spite of the growing competition of the Mexican oilfields. Production remained about the average of over 3,000,000 tons of shale in 1914, but prices fluctuated, and exports decreased from 324,704 tons of oil in 1913 to

	No. of mines at work under Coal Mines Act	No. of persons employed	No. of tons of coal produced
1911	518	138,377	41,718,163
1912	520	143,302	39,518,629
1913	542	147,549	42,456,516
1914	547	146,168	38,847,362
1915	535	121,854	35,596,856
1916	537	127,104	36,193,000
1917	522	130,027	38,569,964
1918	522	124,475	31,890,218
1919	512	144,286	32,457,864

The estimated output for 1920 was 31,000,000 tons

311,000 tons. Prices were maintained at a high level throughout the war, and the demand was steady, but, at the beginning of 1919, the largely increased cost of production rendered it very doubtful if the industry (which was estimated to employ directly about 10,000 workpeople and indirectly probably about 50,000) could be continued on a remunerative basis. The problem was solved by an offer from the Anglo-Persian Oil Co. to form a new consolidated company known as Scottish Oils Ltd.; its acceptance by the shareholders of the Scottish companies allied the Scottish oil trade with a strong group of oil interests under one central management, and the result has been satisfactory, although demand decreased in the end of 1920 owing to the general uncertainty of trade conditions.

**Textiles.**—The woollen trade in the Borders had a year of great prosperity in 1911, the output and the export trade (especially with Germany) being very great. Thread and yarn makers had also a prosperous year, and the linen trade of Dunfermline was steady, though not brisk, but the jute trade of Dundee passed through one of its worst years, with unprecedented curtailment of production, due chiefly to over-production in Calcutta. The following year saw a remarkable revival in the jute industry, which enjoyed a period of unparalleled success, the woollen trade continued to be prosperous and conditions in the linen trade were normal. Prosperity in textile industries continued through 1913 and was not checked until the outbreak of war, when the export of tweeds and linen came suddenly to an end, and the textile industries as a whole suffered from a decrease in the purchase of luxuries and from the cessation of imports of raw material. Jute, which had been prosperous in the early part of the year, became unremunerative towards its close. New outlets were found in the manufacture of khaki cloths, flannel shirtings, and military blankets, but reorganization took time and was delayed by lack of dyes and by the circumstance that Scottish flannel was largely made from Belgian raw materials. Throughout the war, the Dunfermline linen trade suffered more severely than other textiles, the looms being unsuitable for the goods which were required. The jute trade recovered in 1915, largely owing to Government orders. These conditions continued to the end of the war; prices, in spite of Government control, were very high, and rose after the Armistice. The year 1919 was very prosperous for the jute trade, and linen made a considerable recovery, in spite of difficulties about raw material, but the woollen trade suffered from a poor clip after a severe winter and a late spring. The general prosperity in textile trades continued into the first quarter of 1920, but was followed by an almost complete cessation of demand for woollen and linen goods, and similar conditions prevailed in the jute trade. All over, prices, as determined by cost of production, were too high for the consumer.

**Agriculture.**—Agricultural conditions have undergone a large number of changes. In 1910, agriculture was an unprofitable occupation for the tenant, and rents were low—on the average, about half what they were in the 'eighties. Agricultural wages were also comparatively low, although they had recently advanced, and the average weekly earnings for all classes of agricultural labourers were higher in Scotland than in England. Farmers were feeling the burden of foreign competition and of the expense of the machinery necessary for scientific farming. The food problem during the war gave a new impetus to agriculture, the effect of which may be seen from the following table:—

	Area under:—			
	Crops and grass acres	Arable land acres	Permanent grass acres	Corn crops acres
1911	4,845,835	3,348,568	1,497,267	1,218,055
1914	4,786,179	3,295,040	1,491,139	1,186,432
1915	4,781,416	3,290,543	1,490,873	1,220,307
1916	4,775,525	3,303,180	1,472,345	1,234,748
1917	4,776,200	3,360,342	1,415,858	1,273,549
1918	4,761,101	3,453,494	1,307,607	1,493,169
1919	4,751,475	3,408,479	1,342,996	1,378,318

The largest increase in production was in the years 1917 and 1918. In 1917, the total produce of wheat was 304,169 quarters (an increase of 21,000 quarters over 1916) and in 1918 it rose to 402,000 quarters. The figures for barley and bere are 704,788 quarters in 1917 (an increase of 57,600 quarters over 1916) and 677,000 in 1918; and for oats 5,446,931 quarters in 1917 and 6,457,000 in 1918. The total produce of the potato crop was 1,110,085 tons in 1917 (an increase of 579,000 tons on 1916) and 1,151,000 tons in 1918. Live stock showed similar variations; the number of horses rose from 206,474 in 1911 and 198,704 in 1915 to 207,113 in 1916 and 210,048 in 1917, falling slightly in 1918. Numbers of sheep and pigs declined slightly in the war years—sheep from 7,164,342 in 1911 to 6,878,108 in 1918, and pigs from 171,115 in 1911 to 128,007 in 1918, but cattle rose from 1,200,017 in 1911 to 1,225,330 in 1916 (1,209,842 in 1918).

The increases in corn crops and potatoes were the result not only of economic conditions, such as rising prices, but also of administrative and legislative measures. In the summer of 1915 the Secretary for Scotland appointed a departmental committee to report on the measures necessary to increase the production of food during the war; in 1916, the attention of military tribunals was directed to

agricultural necessities, and the army lent military labour at certain seasons of the year. The Corn Production Act of 1917 led to the division of Scotland into districts with District Wages Committees to fix wages. The general prosperity of agriculture is shown by the rise in Fairs' Prices—average prices ascertained annually by an inquiry held by the sheriff of a county in order to fix the amounts payable to parish ministers for each kind of grain. The prices vary considerably in different counties, but the value of all sorts of grain and of oatmeal was doubled or trebled between 1911 and 1918, and remained at its high level through 1919 with a slight decline in 1920. The wages of agricultural labourers increased proportionally, and their standard of living rose, giving impetus to a tendency notable before the war, to abandon the traditional brose and porridge in favor of more expensive foods and especially butcher's meat. A result of agricultural prosperity was a very large number of sales of land in 1919 and 1920. Scotland, to a large extent, ceased to be a country of huge estates, and the number of farmers who farm their own lands greatly increased.

**Forestry.**—Before the war, there was a revival of interest in forestry, due to the exertions of several Scottish landlords, and to the action of the Board of Agriculture and the Development Commission. In 1912, a departmental committee, appointed to select a suitable locality for a demonstration forest area, issued an elaborate report on steps for the promotion of silviculture, some of their suggestions being adopted by the Development Commission in 1913. These developments were interrupted by the war, for scarcity of labour put an end to afforestation, and the extensive demand for timber brought about a depletion of woodland areas from 1915 onwards. It was estimated in 1919 that more than half of a horse production of 40,000,000 cubic ft. of timber had come from Scottish forests. The depletion of woodlands was continued owing to the demand for timber for purposes of reconstruction in 1919 and 1920, and in June of the latter year there was a series of destructive forest fires in Ross-shire, Inverness-shire and Aberdeenshire. In 1919, a Forestry Act, passed for the United Kingdom, transferred to the Forestry Commission the powers in this respect of the Board of Agriculture for Scotland. The Commission had acquired, by the end of 1920, about 60,000 ac., of which about half was plantable.

**Fisheries.**—The character of the Scottish fishing industry was already undergoing an important development by the year 1910. It was ceasing to be conducted by small fishing boats, owned by the fishermen who used them, and was passing into the hands of large companies whose capital provided the necessary fleets of steam drifters. The capitalization of the industry was extending to salmon fisheries, which were being bought up by wealthy companies. These conditions have persisted even in the Highlands and Islands, where the combination of fishing with the cultivation of crofts became much less common. In 1910, the Scottish fishing fleet consisted of 9,724 vessels, valued at £4,409,027, of which 1,073 (valued at £2,457,586) were propelled by steam; in 1919, there were 6,534 fishing vessels, valued at £7,198,431, of which 3,722 were sailing or rowing boats; the remainder consisted of 294 steam trawlers (valued at £3,342,253), 767 steam drifters, and 1,751 auxiliary motors. The number of boats which possessed auxiliary motors in 1910 was 156. Between 1910 and 1919, the number of sailing and rowing boats decreased from 8,175 to 3,722, and the estimate for 1920 from £642,902 to £122,823. The sailing and rowing boats were manned by 25,985 men and boys in 1910, and by 9,830 in 1919; the total number of men and boys employed as crews decreased from 38,041 in 1910 to 27,408 in 1919. The increase of motor vessels in the western area was a notable feature of the period. In 1910, 40 motor vessels belonged to Campbeltown and 11 to Ballantrae, and 23 to other W. coast fishing ports; in 1919, the numbers at Campbeltown and Ballantrae had increased to 78 and 88 respectively and there were 209 belonging to other ports, of which Loch Carron and Skye possessed 80 (as compared with 4 in 1910) and Inverary 70 (as compared with 8 in 1910). Stornoway, where there were no mechanically propelled vessels in 1910, had 18 steam liners and drifters and 13 motor-boats in 1919. The steam trawlers were still, in 1919, confined to Leith, Montrose, Aberdeen (which possessed 193 out of 294), and Peterhead, except for 8 belonging to Greenock. The large use of motor-boats was partly a result of the diversion of steam drifters to other purposes during the war, and the demand for them decreased in 1919, when steam drifters again became available. In the course of the war, 320 trawlers, 829 drifters, and 133 motor-boats (a total of 1,264 fishing vessels) were requisitioned by the Admiralty, chiefly as naval auxiliaries. Of these, about 100 were lost while on war service; of the remainder, all except 131 were released in 1919 and most of them had been reconditioned and were again engaged in the fishing industry by the end of that year. The number of Scottish fishing vessels sunk while engaged in fishing in the course of the war was 96, of which 51 were trawlers. In June 1915, no fewer than 34 vessels were lost, and the experience of that month led to the enforcement of very severe restrictions upon the fishing industry. The effect of war restrictions is evident from the total quantities of fish (exclusive of shell-fish) landed in Scotland in successive years by Scottish vessels:—1913, 7,267,323 cwt.; 1914, 6,926,241 cwt.; 1915, 2,319,390 cwt.; 1916, 3,412,030 cwt.; 1917, 3,079,768 cwt.; and 1918, 3,313,228 cwt. In 1919, the quantity rose to 5,968,866 cwt. The value of the catch naturally rose in proportion to scarcity; the value of over 7½ million

cwts. in 1913 was £3,733,379; of about 2½ million cwts. in 1915, £2,051,171; and of over 3 million cwts. in 1917, £3,645,015. The most remarkable rise occurred in 1918, when about 3½ million cwts. were valued at £5,991,692. In a week of Jan. of that year, the average price of all white fish sold in Aberdeen was £7 9s. 2d. per cwt. Maximum prices were fixed, but they had necessarily to be fixed at a high level in view of scarcity of labour and the special dangers attaching to fishing industry. In 1919, the increase in quantity over 1918 was 80%, but the value was £6,063,739—an increase of only a little above 1%, as compared with 1918; but the average price in 1919 was about double that of 1910, and prices remained high through 1920. The stress of the outbreak of war was felt specially heavily by the herring industry, for the chief markets for cured herrings were in continental Europe and communication was cut off. There was a large existing stock of unsold herrings, and great quantities had been sent to German ports. As the war progressed, decreased production and increased home demand led to a great improvement, and exports were resumed—in 1916, 366,682 barrels of herring were exported (as compared with 1,385,323 barrels in 1913), and 113,284 barrels in 1917—so that 1914 was the only disastrous war year. Increased production in 1919 brought about a difficult situation, for political and economic conditions in Russia and in Central Europe prevented the resumption of trade, and the industry was saved from disaster by a Government guarantee, which was renewed for 1920, but was refused for 1921, which opened with very gloomy prospects for the herring fishing industry. A committee of the Fishery Board recommended in 1919 that whaling operations should be prohibited in any part of Shetland, on the ground that the decline of the herring fishing in Shetland is directly connected with the introduction and development of whaling, an industry carried on almost entirely by foreigners.

**Railways and Transport.**—No new railways have been constructed since 1911, and the whole railway conditions have been abnormal since 1914. Serious railway accidents during the decade include a collision at Burntisland on April 14 1914, in which two railway employees were killed; collapse of a culvert near Carrbridge on June 18 1914, involving a disaster to a train and the deaths of five passengers by drowning; and an accident at Ratho on Jan. 3 1917 resulting in 12 deaths. The gravest railway disaster occurred to a troop train at Quintin's Hill, near Gretna, on May 22 1915, when 227 of the 7th Royal Scots were killed and 246 were injured. The accident occurred through the carelessness of two signallers, both of whom received sentences of imprisonment. There has been a large increase in motor transport, but agriculture, fishing, mining and commerce are still handicapped by the lack of transport facilities. The proportion of mileage of railway to pop. is much smaller in Scotland than in such a small maritime country as Sweden, the number of miles of railway per 10,000 pop. being 16·2 in Sweden and 8·2 in Scotland. Transport conditions compare even more unfavourably with Belgium, which has a great system of canals, in addition to an elaborate system of railways, light railways and steam tramways. A committee on Rural Transport, appointed by the Secretary for Scotland, reported in 1919 that the construction of a considerable number of railways and light railways is essential for the development of the country, especially of inland straths and glens in various regions and of the W. coast and the islands. They gave illustrations of the results of lack of transport—the impossibility of growing early potatoes on soil specially suitable, the continued use of land for sheep farming which could be turned into good meadow land, the closing of a lead mine and the impracticability of working iron stone. In many districts, land could carry more stock and would be capable of closer settlement if better transport were available. The system of water transport could also be extended with advantage. Scottish canals fell largely into disuse after the introduction of railways, and some of them were acquired for the construction of their permanent way by railway companies. The total mileage of canals in Scotland is 183. There has been much discussion of the project of a reconstruction of the Forth and Clyde Canal, but without any result. The question of transport is closely associated with the utilization of water-power, several schemes for which are under consideration, the most important being schemes for the utilization of water-power in the districts of Lochaber and Fort William. In the large towns, there has been a great development of systems of electric tramways and motor omnibuses, and motor vehicles running in rural districts have proved formidable competitors to the railways.

**Highlands and Islands.**—The Board of Agriculture issued in 1913 a report on home industries in the Highlands and Islands by Prof. R. W. Scott, who pointed out that most of the existing home industries depend upon raw materials derived from the land—the hosiery and tweed industry using wool, and the basket industry, osiers, and that the encouragement of these industries must be closely connected with general agricultural policy. Shetland industries depend upon an improvement of the wool of Shetland sheep; in the Hebrides a deterioration in the quality of home-grown wool has led to large imports for Harris tweeds, while in Skye little has been done to encourage the cultivation of osiers. The report recommended the creation of local committees, under the authority of the Board, to supervise cottage industries, but the outbreak of war prevented the carrying out of the suggestions made. The home industries in existence in the Highlands and Islands in 1911 were hosiery, wool and worsted manufacture, basket-making, lace-making, silk-spinning,

shirt-making, umbrella manufacture, straw hats and bonnets manufacture, small ware and fancy goods, but only one person was reported as engaged in lace-making. The total number of workers in home industries was 5,649, about 500 of whom were males. An attempt by Lord Leverhulme to establish in Stornoway a large fish-curing and packing industry and to develop the whole resources of the island has been hampered by the seizure of land by returned soldiers, and the future of the project was in 1921 still uncertain. Lord Leverhulme's proposals included the construction at Stornoway of a fishing harbour superior to any existing harbour on the W. coast or in the western islands and the completion of a canning factory and of carding and spinning mills, the building of which was begun before the interruption of the execution of the scheme by the "raiding" of farms in the spring of 1920. The organization not only of the fishing industry but also of the Lewis and Harris hand-woven tweed industry was thus contemplated, along with the opening up of the common grazing lands in Lewis and Harris and the provision of some 3,000 allotments of a quarter of an acre in size, selected so as not to interfere with existing dairy or other farms.

The effects of the World War can readily be traced in Scotland of the present day. The efforts made, alike for the recruiting of the fighting armies, for the production of ships and munitions, and for the maintenance of food supplies, and generally, of the social and national organization, rendered those years the most strenuous period in the whole history of the country, and constitute a record of courage and endurance which cannot but leave its mark upon the national character. Like other portions of the Empire, Scotland has, since the end of 1918, suffered from the weariness produced by stupendous effort and from a consequent restlessness and impatience which has found vent in industrial disputes and in an eager adoption, by some of the youth, of new social ideals, in which the influence of Russian Bolshevick experiments and propaganda has been conspicuous. Such manifestations can be paralleled from other periods following the end of a great military struggle, and there is already evidence that the disturbances in organization and habit produced by the experiences of the war have reached their climax, and, with the restoration of commercial and industrial prosperity, will cease to operate adversely upon the peace of the country.

(R. S. R.)

**SCOTT, CYRIL (1879– )**, English musical composer, pianist and author, born at Oxford, Birkenhead, Sept. 27 1879, was musically educated at the Hoch conservatorium, Frankfurt A/M, chiefly under Ivan Knorr. While still in the pupil stage Scott heard his first symphony performed at Darmstadt in 1899. On Scott's return to England Hans Richter produced an orchestra suite by him at Liverpool. Subsequently Scott produced a vast amount of music, more especially of songs, most of which are on the same high level as that of the *Schumacherlieder* of his student days. Violin and pianoforte music also poured from his pen. A series of early overtures written for plays by Maeterlinck seem to have been suppressed, but there remain a Christmas overture, the two fine Passacaglias, the *Ballad of Fair Helen*, *La Belle Dame sans Merci*, and a pianoforte concerto and also two quintets, a piano quartet and a violin sonata. Scott also published several volumes of poems, including *The Voice of the Ancient* (1910); *The Vales of Unity* (1912); *The Celestial Aftermath* (1915) and the prose book *The Philosophy of Modernism* (1917). In 1920 his *Nativity Hymn* was accepted for publication by the Carnegie Trust, and in 1921 he paid a visit to the United States.

**SCOTT, SIR JOHN EDWARD ARTHUR MURRAY, BART. (1847–1912)**, English art collector, was born at Boulogne Feb. 23 1847. The son of an English doctor at Boulogne, he became secretary to Sir Richard Wallace, heir of the 4th Marquess of Hertford. He helped Sir Richard to organize relief for the sufferers of the siege of Paris in 1870, and after the siege, to transport the treasures of the Hertford art collection from Paris to Bethnal Green museum. It was largely through his influence that Sir Richard Wallace's widow left the collection *en bloc* to the British nation, together with Hertford house, and he acted as chairman of the trustees' committee until his death. He became a trustee of the National Gallery in 1897, was created a baronet in 1899, and a K.C.B. in 1908. He died in London Jan. 17 1912.

**SCOTT, ROBERT FALCON (1868–1912)**, English sailor and explorer, was born at Devonport June 6 1868, the son of John Edward Scott of Outlands, Devonport, and entered the navy in 1882. He was promoted lieutenant and appointed to the "Amphion" in 1889, and torpedo-lieutenant to the "Majestic," flagship of the Channel Squadron, 1893, becoming commander 1900. He commanded the National Antarctic expedition of 1901–4 (see 21,966) and in 1905 published his account of it in *The Voyage of the "Discovery."*

On his return he was promoted captain and commanded first the "Victorious," flagship of the Channel Squadron, and subsequently the "Essex" and the "Bulwark." He was awarded the gold medals of the Royal Geographical Society and of the Royal Scottish Geographical Society, and received medals from the geographical societies of many foreign countries, and an hon. degree from Cambridge. During part of 1909 he was naval assistant to the Second Sea Lord of the Admiralty, and in June 1910 he again set out for the Antarctic in the "Terra Nova" in command of a new expedition, financed partly by private individuals but aided by a Government grant. He arrived at Lyttelton, N.Z., in Oct. and reached McMurdo Sound at the end of the year. On Nov. 2 1911 he started on his journey of 850 m. to the Pole, accompanied all the way by Dr. E. A. Wilson, Capt. L. E. G. Oates, Lt. H. R. Bowers, and Petty-Officer Edgar Evans. He reached the Beardmore glacier on Dec. 10 and on Jan. 4 1913 left behind him his last supporting party in lat. 87° 32' S. When last heard of he was about 150 m. from the Pole, which his record shows that he reached Jan. 17 only to find Amundsen's tent and records left there one month earlier. On the return journey Evans fell (Feb. 17) in descending the Beardmore glacier and died shortly after. Blizzards were encountered and progress was slow. Food ran short, and on March 17 Oates went out alone to die. Three days later a fresh blizzard checked the survivors, whose supply of oil-fuel was exhausted and their food-supply very low. Scott's last entry in his diary was made on March 24. He was then only 11 m. from One Ton depot and a supply of food; but he was unable to reach it and died, with Wilson and Bowers, on or about March 27 1912.

A search party, sent out from the base in March 1912, had been driven back from One Ton depot by the weather, and it was recognized that there was no chance of Scott's party surviving the winter. Nothing further could be attempted until Oct., when search parties went out, and on Nov. 12 Dr. Atkinson and Mr. Wright found Scott's tent with the bodies of Scott, Bowers and Wilson and the valuable scientific records. Capt. Scott had a warm sympathy for scientific research and a good knowledge of many branches of science qualifying him for the leadership of an expedition, the main results of which were obtained by the labours of his scientific colleagues. The news of the disaster did not reach England until the survivors landed in N.Z. Feb. 10 1913. A memorial service, held in St. Paul's cathedral, London, Feb. 14, was attended by King George, and by royal warrant the rank and precedence of the wife of a K.C.B. were conferred on Capt. Scott's widow. A fund was raised as a memorial of Capt. Scott, from which ample provision was made for the surviving relatives of the lost explorers, and the balance was devoted to the promotion of polar research, a substantial amount being granted in 1921 towards the endowment of the Polar Research Institute of the Geographical department of the university of Cambridge.

On Sept. 2 1908, Scott had married Miss E. A. Kathleen Bruce, daughter of Canon Lloyd Bruce. Lady Scott had attained some reputation as a sculptor, and, later, executed statues of her husband, which have been erected in Waterloo Place, London, and at Portsmouth. Her other works include a statue of his companion, Dr. Wilson, at Cheltenham, one of Capt. Smith of the "Titanic" at Litchfield, and portrait busts of Mr. Asquith, Lord Knutsford, John Galsworthy, Granville Barker, and other well-known contemporaries. She was one of the first women to undertake munition making, and in 1916 she became private secretary to the secretary of the Ministry of Pensions. In Jan. 1922 her engagement to Lt.-Comm. Edward Hilton Young, D.S.O., M.P. (b. 1870), financial secretary to the Treasury, was announced.

**SCOTT-GATTY, SIR ALFRED SCOTT** (1847-1918), British herald and genealogist, was born at Ecclesfield, Yorks, April 26 1847, the son of the Rev. Alfred Gatty, vicar of Ecclesfield and sub-dean of York, by his wife Margaret Scott (see 11.530), a popular writer. One of his sisters was Juliana Horatia Orr-Ewing (see 10.40), the writer of children's books. The additional name of Scott was assumed by him by royal licence in 1892. He was educated at Marlborough and Christ's College, Cambridge. In 1880 he entered the Herald's College and became Rouge Dragon pursuivant, and in 1886 was appointed York herald. In 1899 he became registrar of

the college, and in 1904 was made Garter principal king-at-arms and knighted. Sir Alfred Scott-Gatty was an authority on heraldry and genealogy, and presented many copies of records to the Herald's College. He was also an accomplished musician, many of whose songs became popular. In 1911 he was created K.C.V.O. He died in London Dec. 18 1918.

**SCRIABIN, ALEXANDER NICHOLAEVICH** (1871-1915), Russian composer, was born at Moscow on Christmas day 1871 (O.S.). His father was a lawyer; his mother, a good pianist and pupil of Leschetitsky, died when he was one year of age. His schooling was received in the Moscow Cadet Corps, but he never showed any liking for the military career for which he was intended, and at 18 entered the Moscow Conservatory of Music where he was a pupil of Safanov and Tanier. On leaving the conservatory Scriabin was greatly helped by the patriotic music publisher Belayef, who brought out his earlier works and arranged a European piano recital tour for him. At 20 he returned to Moscow and joined the conservatory staff. Later he again travelled, this time for six years, visiting the United States amongst other countries. He then settled in Brussels for some time, and in 1910 returned to Moscow. In 1914 Scriabin visited England, giving two piano recitals, playing his own Concerto and appearing as pianist in his *Prometheus*. He was then suffering from a tumour of the lip, from which, soon after his return, he died, April 14, 1915.

As a composer Scriabin represents what may be called the classical school carried forward to its most advanced point. The form of his sonata and symphony movements he derives from Mozart, through Beethoven; however bewildering these may at first sound, they will be found, on a second or third hearing, to be laid out on essentially the Mozart-Beethoven lines. In his pianistic idiom and general pianistic qualities of style, Scriabin derives largely from Chopin, of whose work he was a great admirer. All this then indicates a conservative side to his composition, but he was more radical in his harmonies, and it was, probably, largely the novelty of these that retarded appreciation of his later works. Gradually he evolved what may be called a new scale or, from another point of view, a new chord. It consists of the upper partials of the fourth octave from the fundamental note, less two (taking C as the fundamental note—C, D, E, F♯, A, B♭ or, arranged as a superposition of fourths, as Scriabin most frequently uses them, C, F♯, B♭, E, A, D). The hint of this new harmonic scheme may be seen in the earliest compositions, and its development was fairly regular and consistent, until it came to dominate his later output. In his later works he discards entirely the old key signatures. In his orchestration Scriabin calls for a large force, and uses it very freely: his scores are excessively contrapuntal in texture, the various instruments moving very independently and weaving together their respective themes: muted brass plays a large part in his orchestral colour scheme. In the First Symphony a chorus is used in the finale; the "Poem of Fire" also uses a chorus, but in an orchestral way, no words being supplied. For the last-named work the composer also wrote an optional part for a "Tastiera per luce," or keyboard of light, the intention being that varying colours should play upon a screen as the work was being performed. The composer was greatly interested in theories as to a correspondence between the musical scale and the scale of colours. In his great *Mystery* (left unfinished at his death) music, dance, speech, perfume and colour were to be combined; this work was to be rather a work of ritual than of art, and was to express its author's idealistic mysticism through the medium of 2,000 participants.

It is usual to look upon Scriabin's musical work as largely the expression of theosophical views, and undoubtedly much of his inspiration was drawn from the works of Blavatsky and others. He was not, however, a close reader, or a careful thinker. Seizing the main idea of a book or a creed, he would neglect the details, and his imagination would quickly develop a huge scheme of thought having little relation to what he had read. The titles of many of his works and of their separate parts, and the marks of expression affixed to particular passages, indicate plainly the existence of a spiritual "programme." The emancipation of the human soul through ceaseless striving, and its achievement of self-expression, may be said, very roughly, to represent the general sense of the spiritual basis of Scriabin's musical works.

The works of Scriabin have been variously classed into periods. A logical classification is into four periods as follows: 1st period, with a strong Chopin influence; the dividing line between this and the 2nd period runs through the First Symphony, and the 2nd period shows some Wagner and Liszt influences; the dividing line between this and the 3rd period runs through the Fifth Sonata, and a 4th period begins with the "Poem of Fire."

**Works.**—Orchestral: *Reverry* (op. 24); *Symph. I.* (26); *Symph. II.* (29); *Symph. III.*, or *Divine Poem* (43); *Symph. IV.* (54); *Prometheus*, or "Poem of Fire" (60). Piano: *Sonatas I.* (op. 6);

II. (19); III. (23); IV. (30); V. (53); VI. (62); VII. (64); VIII. (66); IX. (68); X. (70). A very large number of preludes, études, improvisus, mazurkas, poems, etc., including the great "Vers la Flamme" poem and the much-discussed last work, the Five Preludes (*op. 74*). Piano and Orchestra: Concerto (*op. 20*). No songs or chamber music are included in Scriabin's output. (P. A. S.)

**SCULPTURE** (*see* 24.488).—The state of coma which, so far as public interest is concerned, had afflicted European, and particularly British, sculpture up to the neighbourhood of 1910, yielded at about that date to a long-sustained treatment of shocks administered by the exhibitors of what has been regarded as "freak" sculpture. These shocks, sporadic but startling and lingering in their effect, had persisted throughout the preceding decade, and the so-called "rebels," authors of these frequently unintelligible sculptural efforts, found their ranks considerably swelled by converts to a system that seemed both easy of adoption and financially profitable. Hitherto, indeed, British sculpture had been well-nigh moribund, and only on occasion had the public evinced an interest in the case by crowding the bedside of the invalid to witness in some London gallery the delirium of the dying art as represented by the works of some new "rebel."

The attention of the public was caught and their mind entertained to an unusual degree in the closing years of the last century when Rodin, the great French master, startled the world by his originality of thought and won admiration by the freshness and vigour of his work. The interest thus awakened was, however, ill sustained in England, until the breach with academicism which Rodin inaugurated by his originality and independence was reflected and rendered wider in the work of the artistic "rebels" in Great Britain. The wave of revulsion from academicism and realism reached perhaps its high-water mark in 1910, and in 1912 had shown no sign of ebbing.

It would be difficult to classify these revolutionaries or to apply to their work any generic term, yet this movement has something in common with the post-impressionism of the painters. It had reached England from the Continent, where it was far more widely spread and had rooted more deeply. In France it received smaller encouragement than in Germany and Austria, where its influence is revealed in much of the recent monumental sculpture. The gospel of the movement forbids in chief any show of anatomical detail, and allows but little of true construction or of natural forms.

There can be little doubt that to this movement, in part at least, was due the awakening of public interest in sculpture about the year 1910. It was during the following year that considerable efforts were made to collect for public exhibition the works of that foremost of British sculptors, Alfred Stevens. That these efforts were successful was plain from the space devoted to the exhibition in the Tate Gallery during Nov. and Dec. 1911 and Jan. following. This exhibition constituted in the case of the majority of visitors a first introduction to the finest sculptor Great Britain had produced. The interest it provoked encouraged a scheme for a further and more permanent collection and preservation of the scattered works of this great master. Public interest in Stevens was promoted to a very large extent by the labours of the Stevens Memorial Committee, and by the enthusiasm and solicitude of Prof. Legros, and it was on behalf of this Committee that in 1911 the late Sir William Richmond presented to the trustees of the gallery an interesting bust of Stevens by Edouard Lanteri. Since then the collection at the Tate Gallery has been enriched by a cast of Stevens's remarkably fine chimney piece at Dorchester House.

Foremost of European sculptural works raised in 1911 were, in Rome, the large memorial to King Victor Emmanuel, and, in London, the great memorial to Queen Victoria at Buckingham Palace. The Victor Emmanuel monument reveals no individualism or inspiration in its design or modelling. The Victoria Memorial, largest of sculptural monuments in London, is imposing in its effect and is magnificently situated at the head of the Mall and before the Palace. In 1912 the great bronze quadriga by Adrian Jones was placed upon Decimus Burton's arch at the top of Constitution Hill, London.

The revival of sculpture which marked this period was not evident alone in parochial and civic patronage; it was found—not for the first time—a suitable and convenient, and certainly an effective, channel, through which might be expressed international courtesies adaptable to various occasions. Three such works, which might be regarded as political, were erected in London during the year 1920–1, to which reference will be made later. During 1912 two such monuments were unveiled in France, both of which were in the form of courtesies between that country and Great Britain. On April 12 M. Poincaré unveiled at Nice the Queen Victoria Memorial, and on April 13 a memorial to King Edward was presented to the public at Cannes.

In the meantime one of the most important events of 1912 in England was the completion of Alfred Stevens's monument to the Duke of Wellington in St. Paul's Cathedral by the addition of the bronze equestrian statue of the duke which was designed to surmount the monument. Alfred Stevens, the designer of this splendid work, had died leaving the memorial incomplete, and it must for ever remain a matter for regret that many important architectural features in Stevens's original design were modified with results destructive to the purity of the style and the elasticity of the structure. It was not until 45 years after Stevens's untimely death that the screens were removed and the completed monument revealed to the public gaze. Fortunately the great sculptor had left behind him a small model which he had designed for the equestrian group, and John Tweed, who was finally commissioned to carry out this portion of the work, followed and developed with no mean intelligence the ideas conveyed in the small original model. The result is not, however, as happy as could have been desired. The horse is in the Renaissance style as intended by Stevens, and is in keeping with the rest of the design; the light is quite inadequate to illuminate the upper parts of the monument, which is far too high for its position, the bronze group barely clearing the overhead structure of the building and consequently suffering some obscurity.

The Tate Gallery, in London, latterly more fittingly known as the National Gallery of British Art, was enriched by the addition of Havard Thomas's bronze statue "Lycidas," the gift of Mr. and Mrs. E. Sadler, while perhaps the most interesting work in the Royal Academy exhibition of 1912 was the same sculptor's statue "Thyrsis," which was acquired by the Felton Bequest Committee for the National Gallery of Melbourne.

The outbreak of the World War had no immediately noticeable effect on British sculpture. The work shown at the Royal Academy exhibition just then concluded had been of an unusually high standard, Sir Thomas Brock's statue of Capt. Cook had been set up in the Mall, London, and a very large number of works of some importance were well on the way to completion in the autumn of 1914. These did much to cover any paucity which might have been apparent in the exhibition of the following year. Nevertheless, upon the outbreak of hostilities a vast number of contracts for important architectural sculpture were at once cancelled or their execution postponed. This, it is hardly necessary to say, resulted in a period of distress and stagnation which terminated only with the demand for war memorials after the signing of the Armistice.

While general attention was focussed upon the war, British sculpture suffered a severe blow by the death of Prof. Edouard Lanteri, of the Royal College of Art. As a sculptor his output amounted to little, but, as he himself would have had it, the fruits of his teaching will long survive him, and those sound constructive principles of sculpture which he taught will remain an influence in that distinctively British school of sculpture which he endeavoured to promote.

Two works of outstanding beauty and remarkable workmanship in the Academy exhibition of 1914 should be mentioned: Havard Thomas's bronze cast of his "Thyrsis," which had appeared in wax two years previously, and Derwent Wood's bronze bust of Mr. Henry James.

No sculpture of importance was made public during 1915 beyond Rodin's "Burghers of Calais," Lady Scott's statue of Capt. Scott, and such works as were exhibited at the Royal

Academy. Mr. Toft's figure, "The Bather," was a notable exhibit, and it was bought by the Trustees of the Chantry Bequest for the national collection. A large work in marble which attracted much attention was the statue "Premier Marin" by the Belgian sculptor Egide Rombeaux. Political interest in Serbia, arising out of the war, was in part responsible for the exhibition this year in London of the work of Mestrovic, the Serbian sculptor; his work, though showing an extreme revolt against academicism, is undoubtedly powerful and full of individualism. Rodin's already well-known bronze group, "The Burghers of Calais," purchased in 1912 by the National Arts Collection fund, was erected in Victoria Tower Gardens, London, and the memorial statue of Capt. Scott was set up in Waterloo Place, London.

Derwent Wood won further honour with his child's head (a portrait of Master Charles Haviland Hillman) in the Academy in 1917. This year was specially marked, however, by the death of that greatest of modern sculptors, Auguste Rodin, a master who has exercised probably a greater influence upon the sculpture of his day than has any before him. His works had long since found their way into every important public and private collection of modern art in Europe and America; a triumph of extraordinary significance, because it was not until comparatively late in his career that he won official recognition.

In Aug. 1919 a picturesque figure was removed from sculpture circles by the death of Walter Winans. Never a sculptor of more than technical ability, Winans worked to please himself and for the entertainment of his friends. Horses and shooting were perhaps as great a passion with him, and, though in sculpture he was a gifted dilettante and no more, he had some successes and was widely known.

Save for the few exceptions of those men who were physically unable to render war-service, almost every British sculptor had now been for some time with the fighting forces or engaged in the hospitals or munition works at home. Metals—particularly those of which bronze is constituted—were controlled by Government in order to safeguard the supply necessary to the manufacture of war munitions. This supply, though sufficient for those needs, did not very far exceed them; it is worthy of note, therefore, that the Government, in the interests of sculpture, ascertained the average amount of bronze used by those sculptors who were still at work, and assigned to each such quantity of metal as was in fair proportion to his previous needs. Beyond this, however, the British Government did little or nothing to encourage or to make use of sculpture, though Germany, in the meantime, found a valuable weapon in the production of war medals, which were designed as propaganda to serve the double purpose of heartening the German people by commemorating real or supposed victories and of disseminating in neutral countries evidence of Albion's perfidy and of the success of German arms. These medals, of which some hundred or more were designed, are in very many cases works of a high artistic order, and several museums in Great Britain have secured fairly representative collections of them.

During 1920-1 no fewer than three public statues which may well fall under the category of "International Courtesies" were erected in London: the monument of "Gratitude" (a bronze group by Victor Rousseau)—the gift of Belgium—erected on the Thames Embankment in Canning Enclosure, Westminster; the statue of Abraham Lincoln by Saint-Gaudens—a gift of the United States; and the bronze replica of Houdon's George Washington, presented by the state of Virginia and set up in Trafalgar Square.

The London memorial to Nurse Cavell by Sir George Frampton, erected near St. Martin's church, Trafalgar Square, caused something like a sensation in 1920 by the evidence it gave of this well-known academic sculptor's conversion to simple and severe forms of archaicism. This was particularly noticeable in the treatment of the architectural forms. Some remarkable sculpture was exhibited in June 1921 by Paulanship, a sculptor of great individuality and strength of modelling. In July 1921 Bertram MacKennal's equestrian statue of King

Edward VII. was unveiled in Waterloo Place by King George. The sculptor was knighted after the ceremony. In Scotland Mr. Pettendriugh MacGillivray was made "King's Sculptor," a title that has no counterpart in England. (C. Po.)

UNITED STATES.—Although the period 1910-20 brought to light no new master in American sculpture, it showed an increase in the number of sculptors, and much good work was done. D. C. French, who in 1920 had reached the age of 70, was still indefatigable; conspicuous among his later works were the "Melvin Memorial" and the statue of Emerson, both at Concord, Mass.; "Lincoln," at Lincoln, Neb.; the Longfellow and Lafayette reliefs; the exquisite Spencer Trask Memorial at Saratoga Springs, N.Y.; and the imposing "Lincoln" for Washington, D.C., besides a score of architectural groups of high value. F. W. MacMonnies erected a "Pioneer Fountain" at Denver and a Washington group at Princeton, N.J. G. G. Barnard was as always original; his gigantic processional in Harrisburg, like his rugged "Lincoln" in Cincinnati, compelled attention and discussion. Paul Bartlett devoted years to his equestrian "Lafayette" for Paris, following this with the pedimental group for the capitol, Washington, D.C. Henry Shady's monument to General Grant (Washington, D.C.) was a work of sincerity. H. A. MacNeil embellished Ohio's capitol with his "McKinley Memorial" and Albany with a soldiers' monument. St. Paul and Springfield, Ill., and Worcester, Mass., gained new works by Andrew O'Connor. A. A. Weinman's Baltimore group, C. Keck's "Republic" in Pittsburgh, and H. A. Lukeman's various monuments were important contributions. Karl Bitter's untimely death in 1915 was a great loss; among his last works were the admirable East pediment of the Wisconsin state capitol, the austere "Carl Schurz" (New York), and the "Lowry Memorial" in Minneapolis. Another good pediment was that of the Kentucky capitol by Charles Niehaus. Miss Anna Hyatt's "Joan of Arc" (New York) was completely successful. Cyrus E. Dallin continued his mounted Indians; "The Appeal to the Great Spirit" was perhaps the finest. J. E. Fraser's "End of the Trail" was a notable achievement. Among portrait statues were Weinman's seated "Lincoln" (Hodgenville, Ky.); Edmund T. Quinn's "Edwin Booth" (New York); R. Tait McKenzie's "Whitefield" (Philadelphia); and Leonard Crunelle's "Governor Oglesby" (Chicago). Herbert Adams produced his "Bryant" (New York), as also his graceful MacMillan Fountain in Washington, D.C. In portrait busts Charles Grafly continued to lead, with his former pupil, Albin Polasek, a close second. Attilio Piccirilli's "Outcast" and "A Soul" were sculpture "by first intention." McCartan's graceful fauns and Rudolf Evans' beautiful "Golden Hour" were of this period. Chester Beach and Paul Manship continued their successful work. Sherry Fry's fountain for St. George, Staten Island, revealed skill of a high order. Evelyn Longman was well represented by her Allison Memorial (Des Moines, Ia.), and the Illinois Centennial Monument, Logan Square, Chicago. Nellie V. Walker had important works in many western cities—for example, her heroic "Keokuk." Lorado Taft's "Black Hawk" and several fountains were also of this period. Doubtless the most stimulating event of the decade was the Panama-Pacific Exposition of 1915 in San Francisco. Among the many sculptors who made valuable contribution to its display of decorative art were Calder, Aitken, Roth, MacNeil, Jaegers, and Konti. (L. T.)

SEAMAN, SIR OWEN (1861- ), English poet and editor of *Punch* (see 24.543), was knighted in 1914. His later volumes include *War Time* (1915); *Made in England* (1916) and *From the Home Front* (1918), mainly reprints of verses contributed to *Punch*. At the beginning of the World War he joined the "Veterans" corps of the former Inns of Court Volunteers, later known as the Inns of Court Reserve Corps (2nd batt. of the County of London Volunteer Regt.). He was gazetted lieutenant in 1916.

SEDGWICK, ADAM (1856-1913), English biologist, was born at Norwich Sept. 28 1856. Educated at Marlborough, King's College, London, and Trinity College, Cambridge, he became fellow and tutor of his college and assisted F. M. Balfour, the first

professor of animal morphology at Cambridge. From 1890 to 1907 he held a readership in that subject himself, and in 1907 became professor of zoology in Cambridge University. Two years later he was transferred to the Imperial College of Science and Technology in the same capacity. Details of his work in cytology and embryology are to be found in 7,720, 9,320 and 328. He died in London Feb. 27 1913.

**SEEBOHM, FREDERIC** (1833-1912), English historian, was a native of Bradford and came of a Quaker family. His interest in problems of modern life, social and religious, led him to study the conditions of English rural life in the past and the religious movements of the Reformation. In his *English Village Community* (1853) he dwelt on the survival of Roman influences in agricultural life; and in his *Tribal Systems in Wales* (1895) he reconstituted a Celtic society from 14th century evidence. He died at Hitchin Feb. 6 1912.

**SEELY, SIR CHARLES, 1ST BART.** (1833-1915), British politician was born at Lincoln Aug. 11 1833. He came of a family which held large property, including coal-mines, in the Midlands, and also in the Isle of Wight. In 1869 he entered the House of Commons as Liberal member for Nottingham, but lost his seat at the general election of 1874. He was reelected in 1880, but seceded from the Liberal party on Irish Home Rule, and in 1885 lost his seat. He was once more elected in 1892, and held the seat until 1895. In 1896 he was created a baronet. Sir Charles Seely was a warm supporter of the Volunteer movement. He died suddenly at Brooke House, Isle of Wight, April 16 1915.

His youngest son, **JOHN EDWARD BERNARD SEELY** (1868- ), British politician, was born at Brooke Hill Hall, Derbyshire, May 31 1868. Educated at Harrow and Trinity College, Cambridge, he was called to the bar in 1897, and from 1900 to 1901 served with the yeomanry during the South African War. In 1900 he entered the House of Commons as Liberal member for the Isle of Wight, but was defeated at the 1906 election. He was, however, elected the same year for the Abercromby division of Liverpool. In 1908 he entered the Asquith Government as Under-Secretary for the Colonies, but in 1910 lost his seat, although in the second general election of that year he stood successfully for the Ilkeston division of Derbyshire. In 1911 he was made Under-Secretary for War, and in 1912 became War Minister. Owing, however, to the events attending the Curragh incident of 1914, he resigned in the summer. He served in the army with distinction in the World War, rising to the rank of general in 1918, and on his return to official life became parliamentary under-secretary to the Ministry of Munitions and deputy-Minister of Munitions (1918). In Jan. 1919 he became Under-Secretary for Air, and president of the Air Council, but resigned in Nov. of the same year.

**SEGUR, PIERRE M. M. H., MARQUIS DE** (1853-1916), French author (see 24,584), died at Poissy Aug. 13 1916.

**SEISMOLOGY** (see 3,817 and 24,589).—Strictly speaking, seismology is that department of knowledge which is concerned with the study of earthquakes, and such was its meaning up to the end of the 19th century, the older seismology being exclusively concerned with the earthquake which could be felt. In the early nineties it was discovered that suitably designed and sufficiently sensitive seismometers recorded disturbances which were evidently connected with great earthquakes, and, as it was known that the intensity of disturbance decreased with an increase of distance from the central region of greatest violence, it was natural to conclude that the very small disturbances, registered at great distances, were due to the same cause that gave rise to the destructive earthquake. With the accumulation of observations difficulties began to arise; it was found that neither the magnitude of the disturbance, nor the distance at which record could be obtained, bore any constant relation to the magnitude of the earthquake. Some shocks of great violence gave small records, not very extensively distributed, while others of much less severity at the place of origin gave much larger records and were registered all over the earth. The distant records, however, continued to be regarded as records of the earthquake itself, and are still generally described as such. In 1909 R. D. Oldham, when examining the circumstances

of the Californian earthquake of 1906, arrived at the conclusion that the fractures and dislocations of the surface rocks, which gave rise to the destructive earthquakes, were but a secondary consequence of a deep-seated disturbance, to which he gave the name of *bathyseism*, and suggested that this, and not the earthquake, was the origin of the disturbance which, propagated through the interior of the earth, gave rise to the long-distance records, commonly known as seismograms. Subsequent consideration of other earthquakes confirmed his belief in the correctness of the conclusion, and from this it results that the word "seismology" is at present being used to cover two distinct and independent departments of study, which may be distinguished as *teleseismology* (ῥῆλε, distant) or the study of the long-distance records, and *egyseismology* (ἐγγύς, near) or the study of the earthquake proper, each being distinct and independent offshoots of the bathyseism, or deep-seated disturbance. It is the first of these which, at the present day, is more especially meant by seismology, and it is an instance of the way in which words gradually depart from their original meaning, that the term should have come to imply something which has no direct connexion with earthquakes.

Nothing is known at present of the origin of the bathyseism, and very little of the depth at which it originates. The latter probably varies considerably, those disturbances which give rise to well-marked teleseisms and moderate surface earthquakes taking place at greater depths than others which are accompanied by violent and destructive earthquakes. The only suggestion which has yet appeared of the depth of origin is by Dr. G. W. Walker, who has followed up certain investigations, started by Prince Boris Galitzin, of the angle of emergencies of the wave-paths, and finds that in many cases they indicate an origin at a considerable depth (it may be as much as 1,200 km.) below the surface. These investigations require following up before they can be accepted as conclusive, but the suggestion is of interest; there is no inherent impossibility, and it seems to offer a possible explanation of some difficulties which have arisen in the interpretation of the long-distance seismograms.

Since 1910 many improvements in detail have been made in the instruments used for obtaining the long-distance records of the newer, or tele-, seismology, and an entirely new principle was introduced by the late Prince Boris Galitzin for a direct measurement of the acceleration of the true motion of the ground. This instrument is based on the fact that, if a plate of quartz is subjected to pressure between two sheets of metal, a free electric charge appears in those sheets, the amount of which is proportioned to the pressure. An instrument was actually constructed on this principle and subjected to experimental tests, but has not been applied to the recording of natural disturbances, owing to the death of the inventor and the effects of the political revolution in Russia.

The rate of propagation of wave-motion through the earth, as registered by long-distance seismographs, has been investigated by Dr. C. G. Knott, who has succeeded in solving the mathematical difficulties of the problem. He finds that the rate of transmission of both the first phase, condensational, and of the second phase, distortional, waves increases continuously till the wave-path attains a depth of about three-tenths of the earth's radius, the wave-paths reaching lesser depths than this having a continuously curved form, convex towards the centre of the earth. Beyond this the rate of propagation is nearly constant, even decreasing at certain depths so that some of the wave paths are concave towards the centre in part of their course. Below six-tenths of the radius the distortional wave is killed out, and is not registered at distances greater than  $120^\circ$  from the epicentre. The rate of propagation of the two forms of wave-motion is about 7.2 and 4.0 km. per second respectively, near the surface of the earth, and about 12.8 and 6.8 at depths of over 1,500 kilometres.

For the older seismology or study of earthquakes proper, see *GEOLOGY* (section *Dynamical Geology*).

**AUTHORITIES.**—The best general introduction to the newer seismology is Dr. G. W. Walker, *Modern Seismology* (1913). The most complete is by Prince B. Galitzin, original in Russian; a German translation, *Vorlesungen in Seismometrie*, appeared in 1912. G. W.

Walker, "Focal depth and the Time Curve," *Brit. Assn. Rep.* (1917, p. 13). C. G. Knott, "The Propagation of Earthquake Waves Through the Earth, and Connected Problems," *Proc. Roy. Soc. Edinburgh* (1919, p. 157). (R. D. O.)

**SEITZ, KARL** (1869- ), Austrian politician, was born at Vienna on Sept. 4 1869, the son of a wood merchant. Left without parents at an early age, he grew up in an orphanage, and, after completing his course in the public elementary school, began to learn the tailoring trade, until through the medium of patrons he was provided with a place in the teachers' seminary at St. Pölten. In this way he became an elementary school teacher. Originally inclined to the German National party, he joined in 1888 the Social Democratic party. He organized the Social Democratic teachers of Vienna, and in the Diet of Lower Austria waged a fierce fight against Burgomaster Lueger and the dominant Christian Socialist party. Elected to the Austrian *Reichsrat* in 1901, he became, after the death of Pernerstorfer, its vice-president down to its dissolution. After the revolution of 1918 he was president of the German-Austrian National Assembly, and subsequently of the national parliament (*Nationalrat*) until the new elections in Oct. 1920, and federal president until Nov. 1920. He was in 1921 chairman of the committee of the Social Democratic party and of the parliamentary party, and vice-president of the *Nationalrat*.

**SELBORNE, WILLIAM WALDEGRAVE PALMER, 2ND EARL OF** (1859- ), English politician (see 24.599), on his return from the governorship of South Africa resumed his prominent position in the House of Lords. He took an active share in defending the House against Liberal attack, and was one of the leading "Die-hards" who maintained an uncompromising resistance to the Parliament bill. In regard to Irish Home Rule, he constantly pressed for a referendum to the people. As a former First Lord of the Admiralty, he contributed decisively to the condemnation passed by the House on the Declaration of London. When the World War came he was largely occupied with his military duties with the 3rd Battalion of the Hampshire Regiment; but he joined the first Coalition Ministry as Minister of Agriculture and Fisheries. As minister he appointed a committee of technical experts and practical agriculturists, under the chairmanship of Lord Milner, to report on the means of maintaining and increasing food production in England and Wales; but, fortified by the opinion of a Scottish committee appointed for the same purpose, he and the Government rejected the English committee's recommendation to guarantee farmers a minimum price of 45s. a quarter for the four years following the harvest of 1916. He preferred a plan for organization and coöperation through the county councils and the Board of Agriculture. In June of the following year he resigned his office because he disapproved of the Irish policy accepted by Mr. Asquith's Government as a result of Mr. Lloyd George's negotiations with Irish leaders. He did not join Mr. Lloyd George's Ministry, and after the war he was mainly conspicuous in ecclesiastical matters; he was forward in promoting the movement for self-government in the Church which culminated in the Church Enabling Act of 1919. His elder son, **ROUNDELL, CECIL, VISCT. WOLMER** (b. 1887), entered Parliament in 1910, and proved an active member of the Unionist party. A younger son was killed in the war.

**SELF-DETERMINATION.**—This phrase, defined in the Oxford *New English Dictionary* as "the determination of one's mind or will by itself towards an object," was used exclusively, from the 17th century to within quite recent years, as a synonym for "free will" in the individual person, as opposed to the determination of this will by God's predestination—the doctrine of Determinism. Thus John Scott, in his *Christian Life* (1683-6), speaks of "necessary agents, that have no Free-will or Principle of Self-determination," and Bishop Stillingfleet, in his *Origines Sacrae* (1662), of giving man "the freedom of his actions, and a self-determining power." The *New English Dictionary* fails to show any use of the phrase in earlier days in the sense in which it became widespread and familiar at the close of the World War, and it has been commonly assumed that it was a new word coined, or rather adapted from the Russian *Samo-obrazhenie*, to give convenient expression to the political principle for which

the nations of the Entente were then supposed to be fighting, that is to say, the right of nations to determine their own allegiance and form of government. It had, however, been used in this sense even before the war. Thus in his article on *ROME* in the earlier volumes (11th edition) of this *Encyclopaedia* (a recension of the 6th edition article by Prof. H. F. Pelham) Prof. H. Stuart Jones, writing of the Roman provincial government, says that "nothing could compensate for the lack of self-determination" (see 23.653).

It was after the Revolution of March 1917 in Russia that "self-determination" as a political catch-word came into sudden prominence. On April 10 the Russian Government, then dominated by the Radical element under Kerensky, issued a statement which said, among other things, that "Free Russia does not aim at dominating other nations; . . . its object is to establish a durable peace on the basis of the rights of nations to decide their own destiny." The substance of this proclamation was at once condensed into the formula "self-determination, no annexations, no indemnities," which was to produce so profound, and in some ways so disastrous, an influence on the world-settlement which followed the war. The principle of self-determination had, indeed, already been laid down by President Wilson in his address to Congress on Jan. 22 1917. "No peace can last," he said, "or ought to last, which does not recognize and accept the principle that Governments derive all their just powers from the consent of the governed." The principle, and the words in which it is defined, are those of the American Declaration of Independence; it was not till a year later that President Wilson himself crystallized this principle in the word "self-determination" in the address to Congress of Feb. 11 1918, in which he defined the Fourteen Points; and on this occasion the phrase is still marked as a neologism by being printed between inverted commas. "Self-determination" is not a mere phrase," he said; "it is an imperative principle of action which statesmen will henceforth ignore at their peril." Two months later, in his speech of April 6, the phrase had become, as it were, naturalized; he speaks of "the free self-determination of nations upon which all the modern world insists." The inverted commas no longer appear.

President Wilson has been blamed in certain quarters for his failure at the Peace Conference in 1919 to make the principle of self-determination the only basis of the ultimate settlement, for allowing the old diplomatic Adam too much say in the adjustment of national boundaries. In this respect the blame is not deserved; for he had early pointed out that the application of the principle must be conditional; the fourth of the "Four Principles" laid down in his speech of Feb. 11 1918 was "that all well-defined national aspirations shall be accorded the utmost satisfaction that can be accorded them without introducing new or perpetuating old elements of discord and antagonism that would be likely to break the peace of Europe and consequently the world." This is, of course, a serious limitation of the principle of self-determination in its practical application, since it involves a check upon this determination by an outside authority, which authority President Wilson defined as "the organized force of mankind"—embodied in the League of Nations—but which in effect has been, and always must be, those nations that are in a position to make their will prevail, whether inside or outside the League. In practice, then, self-determination has proved largely illusory. The Treaty of Versailles made advances towards the application of the principle, but these advances were tentative and timid. No transferences of territory of the first importance—such as those of Alsace-Lorraine to France or of Posen and West Prussia to Poland—were made subject to plebiscites. In the treaty with Germany plebiscites were prescribed in the cases of the districts of Allenstein and Marienwerder, of Upper Silesia and of North Schleswig, and negative plebiscites in the case of Eupen and Malmédy. In the Austrian treaty plebiscites were prescribed in the cases of Klagenfurt and Teschen, but it was only in the former case that a popular vote was actually taken. A plebiscite was refused in the case of Western Hungary, transferred to the Republic of Austria under

the name of Burgenland. The case of East Galicia was left open, and so remained in 1921. Experience in the case of Upper Silesia abundantly proved the wisdom of thus limiting the right of self-determination. Plebiscites had worked smoothly enough in the case of fairly homogeneous areas defined by ancient boundaries, as in Avignon in 1791 and Savoy and Nice in 1860; they are altogether another matter in districts inhabited by mixed populations divided by bitter national jealousies. The method proved in any case to be costly and dilatory. In large areas it involved an extensive military control which the victorious Allies were unable to provide, while it was impossible to set up provisional governments to supervise the partition of areas over which they exercised control.

The experience of the diplomats at Versailles has then, if properly studied, great value as a corrective to the dreams of idealists who persist in building theories for an imaginary world. But, apart from this experience, it is certain that the principle of self-determination could not be universally applied without overthrowing all that remains of the world's order. Yet the principle remains, in spite of disillusionment, a powerful solvent of established bodies politic, and it is therefore still important to understand its implications. The phrase "the self-determination of nations" is widely accepted as the expression of a principle as clear as it is just. So far as the meaning of self-determination is concerned, it is indeed clear enough. What is not so clear is what is meant by a "nation." This is a subject round which interminable discussions have centred, and which must be examined if the full implications of the principle of self-determination are to be realized.

*Definition of Nation and Nationality.*—Legally defined, a nation is the aggregate of the subjects or citizens of a particular sovereign state, and nationality is the quality of such subjection or citizenship. But the word "nation" has also a wider meaning, which the *New English Dictionary* embodies in the following inclusive definition:—"A nation is an extensive aggregate of persons closely associated with each other by common descent, language, or history, so as to form a distinct race or people, usually organized as a separate political State and occupying a definite territory." This definition is open to criticism, as involving some confusion of thought: and this confusion is not made less confounded by the definition of "nationality" as primarily synonymous with "nation" but "frequently a people potentially but not actually a nation," while a "people" is defined as "a body of persons composing a community, tribe, race, or nation."

The truth is that the vagueness of our terms reflects the vagueness of our ideas about a problem the intricacies of which we have only recently been called upon to unravel. No satisfactory definition of the word "nation" is possible because, save in its legal sense, it conveys no definite idea; and the same is true of the word "nationality." Yet a clear definition is the essential preliminary to any fruitful discussion. It is proposed then, for the purposes of the present argument, to use the word "nation" in the sense of "the sum of people constituting a sovereign and independent body politic," the Latin *populus* as distinguished from *natio*. The word "nationality" it is proposed to deprive of its legal connotation, and to define a nationality as "an extensive aggregate of persons conscious of a community of sentiments, experiences, or qualities which make them feel themselves a distinct people." The various elements that produce this consciousness will be discussed later. They have an important bearing on the practical problem which was only very imperfectly solved by the Treaty of Versailles, namely, the problem raised by the claim of nationalities, thus defined, to become nations. The complexity and perils of the issues involved in this claim may be illuminated by the fact that, even now, in the actual politics of the world, nationalities and nations nowhere coincide. It remains, therefore, of great importance to determine what are the essential qualities of nationality and what are its necessary relations to the conception of the state.

*Theories of Nationality.*—On few subjects has there been so great a difference of opinion as on the question of what con-

stitutes nationality. Fichte explained it, in terms of his transcendental philosophy, as a thing divine and spiritual, a manifestation of the mind of God revealing itself in the national soul. So, too, for Mazzini, the prophet of the Italian *risorgimento*, nationality was a thing sacred, not to be profaned by a cold analysis of its elements, but believed in and suffered for as a prime article of faith—the "faith in liberty"; for him the map of Europe would have to be redrawn on national lines as the necessary first step towards "the universal association of the human race."<sup>1</sup> No student of the history of the rise of nationalities during the last hundred years will underrate the part played by such prophets as these. Yet their enthusiasm by itself explains nothing and would have achieved nothing; it is like fire, itself a subtle and mysterious element, which yet needs very material fuel to feed its destructive and creative force. The explanation of the phenomena of nationality, as other thinkers have realized, must be sought, not in the region of metaphysics, but in that of observed facts.

If we analyze the composition of the several nationalities, we find these elements: race, language, religion, common habitat, common conditions, mode of life and manners, political association. These elements are, however, never all present at the same time, and none of them is essential. Community of race, even where this is put in the forefront of the claim of nationality, is mainly a politic fiction, at least in countries of European civilization, in which the races are inextricably mixed up. Language, again, is as little as race the criterion of nationality. It may be, as Bluntschli says, the expression of a common spirit and of intellectual intercourse, and as such it may be brought powerfully to the aid of nationality, as in the case of the Czech language in Bohemia, or, still more strikingly, of the English language in the United States. But nationality and inherited community of speech are not identical. The Swiss are a distinct nationality, though they speak four different languages. Community of language, on the other hand, has not prevented the British and the Americans from developing different nationalities. Religion, too, has clearly no necessary connexion with nationality, though it has played a great part in creating and stereotyping nationalities, notably in countries of backward civilization, as in the Balkan peninsula or in Ireland. A common habitat and common conditions are doubtless powerful influences at times in determining nationality; but people have thus lived together for centuries without developing a national consciousness, and in many cases—notably in the east of Europe—they have evolved separate national consciousnesses in spite of a common habitat and common conditions. As for manners and mode of life, these are apt to raise stronger barriers between classes than between nationalities. Lastly, political association, though—as in the case of the Swiss—it sometimes encourages the spirit of nationality, is more often its result than its cause.

All these elements, then, may or may not contribute towards the formation of a nationality, but when we have summed them up we are no nearer to a solution of the problem of its formation. Some theorists seek this solution in a psychological process. "A nationality," says Bluntschli, "only comes into being slowly, by a psychological process which gradually produces in a mass of men a distinctive form of existence and community of life, and stereotypes these as the inheritance of the race."<sup>2</sup> For him time, and a tradition of many generations, are the essential conditions. This may be true of the evolution of new nationalities; it is not true of the creation of a new sentiment of nationality in even large masses of persons. It is, for instance,

<sup>1</sup> *Scritti* (18 vols., Milan-Rome, 1861-91), viii, 205; xi, 181, 243; xii, 245. Mazzini avoided the practical problem involved in the reconstruction of Europe on national lines by saying that it was sufficient to indicate the "large lines" and "to leave details to the future and to the votes of the peoples" (x, 137). His own plan of reconstruction included the restoration to Poland of the frontiers of 1772, and the setting up of a Bohemian-Moravian-Hungarian federation. As Signor Salvemini (*Mazzini*, 1920) points out, "the 'design of God' was not quite so clear as Mazzini believed."

<sup>2</sup> *Lehre vom modernen Staat* (5th ed. of *Allgemeines Staatsrecht*, 1875), i, p. 92.

the boast of the United States that they have been able to absorb annually some million of alien immigrants, and that one generation has usually sufficed to give them not only the name but the full sense of American nationality. The "psychological" element, indeed, may be admitted, but it does not explain the whole of the phenomena nor the ultimate driving force, so to speak, of nationality.

The German historian Karl Lamprecht came nearer the truth when he added another element, the economic, as the creative force in the evolution of nationality. Like Bluntschli, he found a general law for this evolution in the development of the *Volksgeist*, but he explains this development by changes in economic conditions. Nationality, that is to say, is but a manifestation of the instinct of men to group themselves for the defence of their common interests, and it follows that the groups thus formed tend to shift and change with the ebb and flow of the economic struggle for existence. This view, which—if it be sound—obviously conflicts with the belief that the triumph of the principle of self-determination would bring permanent peace to the world, was elaborated by the Austrian Socialist Otto Bauer, in his *Nationalitätenfrage*, with special reference to the nationality question in the former Habsburg Monarchy. "It is," he said, "the battles of the economic classes, everywhere active, the changes in the means and the conditions of work which determine the strength and weakness, the death and rebirth of nationalities." The determining factors of nationality in Austria-Hungary—which for the purpose of this study might be considered the laboratory of Europe—he declared to be not cultural but economic. The mass of men, the peasants and the labourers, are incapable of that consciousness of a widespread, common, inherited culture which is supposed to be the hallmark of nationality; but they are dissatisfied with their lot, resentful of the dominant powers whom they hold responsible, and ready therefore to group themselves against them.

This revolutionary tendency, which among the lower classes of the dominant races is anti-national and cosmopolitan, is apt among subject races to express itself in *nationalism*. The process was strikingly exemplified in Bohemia, where the flood of Czech nationality followed the channels opened up by industrial change, and German nationality succumbed not so much to cultural as to economic pressure. Before the World War the same process was taking place in all the eastern marches of Germany—in Silesia, in Posen, and in East and West Prussia, in which for years past the German element had been succumbing to the irresistible flood of Polish nationality, of which the unifying force was the economic opposition of the Slav proletariat and peasantry to the German capitalist and governing classes. The same phenomenon is apparent in the case of Ireland. The idealists of Sinn Féin never succeeded in inspiring the shrewd peasantry with their own enthusiasm for their "Milesian past"; the use of the renovated Gaelic language remained a conceit of the "intellectuals" of the cities; and the labourers and peasants were won to the Republican cause by a frank appeal to their economic interests—the promise of small holdings and of freedom from war taxation and the burden of the national debt.

It is then clear that there is an economic basis for nationality, and that, whatever other elements may enter into it, a sense of community of material interests is always present. It may be added that this sense is the strongest and most essential factor, and that without it nothing else will serve to maintain the common sentiment. Common origin, common language and a common tradition of culture and laws will not preserve the unity of a nationality when the material interests of its parts come into violent conflict. This truth received its most momentous illustration in the secession of the southern states of the American Union in 1860-1 and the bitter struggle that followed. The principle of state sovereignty and independence on the one side, and that of American national union on the other, did but disguise the true causes of the struggle, which were less political than economic; the agricultural south was determined to preserve its economic system, based on negro slavery; the industrial north was primarily inspired, not by any abstract love of

coloured humanity, but by the economic objection of the labouring masses to the slave system.

*Relation of Nationality to the Nation or State.*—In considering the relation between the idea of nationality and that of the state we are apt to be confused by the romantic and idealistic tinge given to the idea of nationality by the poets and philosophers of the struggles for freedom. A nationality, conceived as something divinely inspired, is believed to have not only the capacity but the right to become a nation, and its legitimate growth to be necessarily stunted if it be prevented from doing so. Bluntschli, for instance, described a nationality as an incomplete organism which could only become completed as an effective "personality" by political organization as a nation or state, and some such idea underlay the Liberal enthusiasm for that "principle of nationalities" which during the last hundred years has so profoundly changed the map of the world. But when we come to examine this principle, as stated by its most conspicuous champions, we find no clear conception of what it ultimately involves, while the main question—of what constitutes a nationality—is consistently begged. The late M. Émile Ollivier, for instance, defines the principle of nationality (and incidentally of self-determination) as follows:—

This principle is that every association of men called a people is an independent individuality; free, sovereign, enjoying the imprescriptible right of self-determination (*de disposer d'elle-même*) both in internal and external affairs.<sup>1</sup>

If the word "people" be taken in its usual non-political sense, this statement was, and remains, obviously untrue, or represents at most an aspiration; if it means a *nation*, then the principle as here defined is merely that of the sovereign independence of nations, *i.e.* states, which has always been a fundamental doctrine of international law; it is, that is to say, a conservative, not a revolutionary principle. But this is not what M. Ollivier meant by it. For him, as the apologist of the Liberal Empire, the principle of nationality was dynamic, not static; it involved a regrouping of the nations, not—as Alexander I. of Russia had once proposed—by the formation from above of homogeneous populations fenced off by their natural boundaries, but by the free vote of the people concerned—the Napoleonic plebiscite. This principle of nationalities, he says in his *L'Empire libéral*, is to be carefully distinguished from the theory of great agglomerations, the natural limits of the race, for race has nothing to do with it:—

In the politics of nationality there are no natural frontiers. The true frontiers are those fixed by the will of the populations. The idea of race is barbarous, exclusive, retrograde, having nothing in common with the large, holy, civilizing idea of country (*patrie*).

Renan, in his *Qu'est-ce qu'une nation?* comes to much the same conclusion. A *Zollverein*, he says, is not a *patrie*; a nation is a grand aggregation of men with a moral conscience which causes them to sacrifice their individual interests to those of the community; wherever the existence of such a moral conscience is proved a nation exists as of right. "If there is any doubt as to its frontiers, consult the populations in dispute."

This solution of a difficult problem would be admirably easy were the rivalries of nationalities confined to the frontiers of states, which we have the best reason to know they are not, and were these frontiers themselves a mere question of marks on the map. But in any case, as Herr Bauer points out, this "psychological-voluntarist" theory begs the whole question of nationality, for it does not explain the factors that determine the will of populations to form a nation or to attach themselves to a nation already formed—supposing they are conscious of possessing a choice. It does not, that is to say, give us the real connecting link between nationality and the state, nor does it explain why in the 19th century, for the first time, nationality was erected into a *Staatsprinzip*.

Historically it seems clear that the explanation is at least largely economic. It may be true that a *Zollverein* does not constitute a *patrie*, but the experience of Germany proved that it may be a powerful element in the constitution of one. It was

<sup>1</sup> *L'Empire libéral*, i., p. 164.

not enthusiasm for the abstract rights of man which bound together the old provinces of France in a sense of common nationality; it was the economic gains of the Revolution, the creation of a prosperous nation of *bourgeois* and of peasant proprietors, that made the *patrie*. It needed the passion of Mazzini and Garibaldi for an ideal Italy to rouse the Italians to throw off the yoke of an oppressive and alien system, but it was the long prosaic labours of Cavour that laid firmly the economic basis of Italian unity. Instances, indeed, might be multiplied to show that, whatever may be the constituent elements of nationality, it is only a strong sense of common material interests that can create and maintain a nation. It is certainly no mere coincidence that the development of the principle of nationality during the 19th century kept pace with the vast economic changes produced by the industrial revolution.

The factor of sentiment is not, of course, excluded; but the sentiment of nationality is not a thing apart, or especially holy. It is, as Mr. A. J. Balfour has pointed out, but one of a group of such sentiments for which there is no common name. Man is a gregarious animal; he has the group instinct; and this implies also the instinct of self-sacrifice for the sake of the group—*esprit de corps*, the civic sense, local or national patriotism. All human associations are directed to some common good, and from the point of view of the group sentiment it matters little how this good is conceived—whether as material or spiritual. A trade union is an association for a purely economic purpose; but it demands self-sacrifice on the part of its members, and it certainly develops a strong sense of *esprit de corps*. To say, then, that the strongest and most permanent bond of a nation is the sense of common interests is not to belittle the value of loyalty to a national cause.

The modern world has become so accustomed to hearing of nationality as the basis, or the only sound basis, of the state that it is apt to forget how very recent is this conception, which for many people is rooted in the very nature and justice of things. The sentiment of nationality is of course very ancient; it is indeed (as the Latin word *natio*, from *nasci*, "to be born," implies) a natural development of the sentiment of the family and the tribe. But this sentiment was, until comparatively recently, not consciously associated with any conception of the state as we understand the term. The ancient Greeks were strongly conscious of their common Hellenism, but their political unit was the city state; there was a Greek people, but no Greek nation. The Roman Empire, which, as it were, flattened out national differences throughout the civilized world, was in essence the expansion of the city state; it was in no sense "national," even from the point of view of the Romans. The Middle Ages, which inherited the Roman tradition, recognized nationality, but not as the constituent principle of bodies politic. The voting in general councils of the Church was by "nations," but these had so little to do with the conception of states that it was not until the Council of Constance, in 1414, that a fourth nation was added to the Italians, the French and the Germans—the English, who had hitherto been included among the Germans. Yet so early as the 11th century the poet of the *Chanson de Roland* celebrates "French" valour and puts into the mouths of his warriors praises of "sweet France," and in the next century the German minnesingers are denouncing "welsh" arrogance and exalting German nationality. Yet there was so such thing as a national state, the root reason being that the material basis of society was feudal, that is to say, determined by the ownership of land—the only stable form of wealth then existing—and by an elaborate system of reciprocal services and obligations which took no account whatever of the frontiers of nationality. With the growth of the fenced cities, and of the commerce of which they were the centres, the feudal system gradually decayed. But the monarchies which rose upon its ruins had still for the most part a purely territorial basis, and so continued as long as landownership gave the strongest title to wealth and power, that is to say, until the beginning of the 19th century. The industrial revolution, with the vast impetus it gave to international commerce and the new self-conscious

classes it created, sapped their foundations. Artificial boundaries became a nuisance, and the German *Zollverein* was the beginning on a large scale of a process of economic concentration, segregation and exclusion which has continued ever since, and is likely still to continue. To say that it is economic pressure which has largely determined the formation of nations is not to pretend that the economic vision of peoples is always clear. The group instinct sometimes defeats its own ends. The disappearance in 1918, for instance, of the last of the great purely territorial monarchies, Austria-Hungary, destroyed an economic unit of the greatest importance to all its constituent countries. It used to be said that if Austria did not exist, Austria would have to be created. This was from the political point of view. From the economic it was true still.

*National Expansion.*—"If men had any strong sense of the community of nations," says Bertrand Russell, "nationalism would serve to define the boundaries of the various nations. But because men only feel community within their own nation, nothing but force is able to make them respect the rights of other nations, even when they are asserting similar rights on their own behalf" (*Principles of Social Reconstruction*, p. 33). The truth of this is revealed in the whole history of the last hundred years. The Magyars, after securing their own liberty by a gallant struggle, proceeded to force their own national ideals on the races subject to them. The Germans, welded into a great nation by "blood and iron," embarked on a policy of conquest beyond their own borders. The Italians, when they had liberated themselves from the Germans, aimed at recapturing the "national frontiers" of Italy, though this involved the attempt to absorb alien populations, and even began to dream of reestablishing the Mediterranean empire of Rome. The Poles, reunited after a century and a half of agony, scarcely waited for the ink on the Treaty of Versailles to dry before starting on the great adventure of reconquering their frontiers of 1772. Even Bolshevik Russia, wicked fairy godmother of the bantling "self-determination," showed little disposition to allow her outlying provinces to determine themselves. The Sinn Feiners in Ireland passionately claimed self-determination for themselves, but equally passionately resented its application to the solid minority in Ireland concentrated in north-east Ulster when they too demanded it.

All this, though lamentable from the point of view of self-determination considered as an instrument of peace, is merely the natural outcome of this principle considered as the expression of group selfishness. If the national group is bound together by a vivid sense of common and exclusive interests, sooner or later it will seek to expand, if it is a healthy organism and thus subject to the ordinary laws of growth. German political theory before the World War conceived of the national group as such an organism, and as subject to the universal law of the struggle for existence and the survival of the fittest. "A cessation of growth," said Paul Rohrbach in his *Der Deutsche Gedanke*, "would be for us a catastrophe both internal and external, for under our present conditions it could not possibly be natural or voluntary, but would only happen when another people or combination of peoples should hurl us to the ground in such a way as to make us infirm for a long while to come." "In every great nation," he says again, "the instinct of self-preservation reveals itself in the form of a natural pressure to expand, which only finds its frontiers where it meets other national-political counteracting forces strong enough to resist it." From the ideal point of view this "doctrine of conquest" is, of course, wholly evil and misguided. From the strictly scientific point of view, judged that is to say by the experience of the past and even of the last few years, it must at least be treated with respect. To this world-old doctrine of conquest, reinforced by the new spirit of national exclusiveness, the new doctrine of democratic self-determination, combined with a new organized spirit of international good-will, is prescribed as an antidote. How far is it likely to prove effective?

*Self-determination and Peace.*—The advantage of the old unnational conception of the state was that it offered no rigid

barriers to the economic expansion of the nationalities, in so far as these existed outside the political sphere, the overflow of a nationality in one state percolating, or occasionally flooding, into another without any sense of inconvenience to the state invaded, which merely received a very often welcome addition to the number of its subjects. In the days before the industrial revolution these transferences of population were, indeed, more often determined by other than economic causes. Thus in the 17th century some 30,000 Slav and Albanian families migrated into the Habsburg dominions, Slavonia and southern Hungary, in order to escape the fury of the Turks; Flemish and French Protestants fled in thousands to the British Islands; and the Electors of Brandenburg peopled their waste spaces with Huguenot refugees from France and Protestant refugees from southern Germany. In the industrial age the migrations took another form. German industrial expansion demanded a vast supply of cheap labour, and this was provided by a mass immigration of Slavs, which created misgiving even when the German Empire was supremely powerful.<sup>1</sup> Little misgiving was created, on the other hand, by the still vaster immigration of all the less developed nationalities of Europe into the United States and, later, into the British Dominions. The process, indeed, was in itself unobjectionable so long as the migrating masses carried with them no conscious sentiment of nationality in a political sense, and no claim to assert themselves as separate entities, *i.e.* so long as allegiance was conceived as due not to the nationality but to the state. It is quite another thing when, under the principle of self-determination, the balance of nationalities in any given state becomes a matter of vital importance to the state itself. The Emperor Leopold I. would hardly have given special privileges to the Slavs who sought refuge in his dominions had he foreseen that this migration would lead, some 200 years later, to the downfall of the Habsburg Empire and dynasty. The danger of similar consequences is increased when the constitution of the state itself is made dependent upon a popular vote, and all the signs point to the fact that self-contained nations will no longer permit promiscuous immigration—the United States has set the example by “tightening up” its immigration laws—and will be increasingly intolerant of national divergencies within their own borders. The effect of the principle of self-determination, logically applied, would therefore be to establish the nationalities as jealously segregated nations, probably surrounded by tariff walls, certainly defended against dangerous infiltration of alien elements from without by rigid rules as to naturalization, and earnestly bent on reducing all within their borders to the same national model. The danger to peace of attempting to confine the expansive forces of nationalism within such artificial limits is obvious, and the danger will not be avoided by the creation of an international force, such as the League of Nations, charged with the duty of preserving the *status quo* or of readjusting it according to the ebb and flow of the national life of the several communities; for the pressure of the forces of expansion of vigorous nationalities, artificially restrained, would blow the League to pieces.

It may be that the economic development of the world, by increasingly demonstrating the interdependence of nations, will reduce the sentiment of nationality to the position it occupied during the long ages when it was not the basis of the state, still less an intolerant crusading power. But the World War at least proved that the international movement associated with labour, disfigured as it was by its insistence on the necessity of a new form of war—that of class against class—was powerless against the passion of nationality. The true hope of peace for the future lies in the recovery by the world of the idea of the state, whatever form it may take, as a thing apart from and above the idea of nationality and infinitely tolerant of national divergencies. It is the ideal towards which the British Empire has been consistently tending. The ideal League of Nations will be some such loose confederation, embracing all the world, of which each constituent state, while guarding its own interests, will realize that these interests are bound up with those of the totality of

states. For such a universal union, however, the world is not ripe; for there are peoples who are not yet capable of self-government, and will only become so, if ever, by a long process of education. To talk of self-determination for such peoples is a mockery. It is also a wrong; for, as Senator Elihu Root wisely said with reference to the Philippines, “the right to government is prior to the right to self-government.”

See W. Alison Phillips, “Europe and the Problem of Nationality,” *Edinburgh Rev.* for Jan. 1915, of which parts are incorporated in the above article; I. W. Headlam-Morley, “Plebiscites,” *Quarterly Rev.* for July 1921 (No. 468); Sarah Wambaugh, *A Monograph on Plebiscites, with a collection of Official Documents* (1921); *Plebiscites*, vol. xxv. of the Peace Handbooks issued by the Historical Section of the Foreign Office (1920); *A History of the Peace Conference of Paris*, edited by H. W. V. Temperley (3 vols., 1920). Among more modern foreign works on the subject are Schallmeyer, *Vererbung und Auslese im Lebenslaufe der Völker* (1903); Kirchhoff, *Zur Verständigung über die Begriffe “Nation” und “Nationalität”* (1905); Otto Bauer, *Nationalitätenfrage und die Sozialdemokratie* (1907). (W. A. P.)

**SELOUS, FREDERICK COURTNEY** (1851–1917), English explorer (see 24.614), in 1909 organized Mr. Roosevelt's hunting expedition in East Africa, and in 1910 represented Britain at the Congress of Field Sports held at Vienna. In Aug. 1914 he offered his services to the War Office, but they were declined on account of his age (he was over 62). Persistence, however, gained him a subaltern's commission (Feb. 1915) in the Legion of Frontiersmen (25th Fusiliers) and he reached Mombasa in May following. Selous took part in many engagements in the East African campaign, was promoted captain and (Sept. 1916) given the D.S.O. He was killed in action at Beho Beho on Jan. 4 1917 (a year after his eldest son had been killed on the western front). His private collection of trophies was given by his widow (Mary Maddy, whom he married in 1894) to the Natural History Museum, London, where in June 1920 a national memorial to him was unveiled—a bronze half-figure by W. R. Colton—a Selous scholarship being also founded at his old school, Rugby.

See J. G. Millar's *Life of Frederick Courtney Selous* (London 1918), and *Geog. Jnl.*, vol. xlix. (1917).

**SENUSSI AND SENUSSITES** (see 24.649).—The military activity of the Senussi from 1900 to 1910 had been directed against the advance of the French in the regions bordering the Sahara between Lake Chad and the Nile basin. There was evidence of an

THE SENUSI COUNTRY

increase of adherents to the sect in Egypt and in Arabia; in N.W. Africa and in the Anglo-Egyptian Sudan Senussism made practically no headway.

<sup>1</sup> See a remarkable series in the *Frankfurter Zeitung* in 1911.

*Activity in Cyrenaica.*—While continuing hostilities against the French, the Senussi sheikh Sayed (Sidi) Ahmad esh Sherif in 1911 aided the Turks in Cyrenaica, then commanded by Enver Bey (later Pasha) in the campaign against Italy. The traditional policy of the Senussites was one of suspicion in regard to the Turks but they had been won over by Pan-Islamic propaganda. By the Treaty of Lausanne, Oct. 1912, the Turks agreed to evacuate Tripoli and Cyrenaica. At that time the Italians held only the chief seaports of Cyrenaica, the rest of the country being in the military occupation of the Senussites and their allies. Sidi Ahmad continued the war with Italy, aided by a body of Turkish troops, which, contrary to treaty engagements, remained in Cyrenaica. The Italians devoted their attention to the occupation of the hinterland of Tripoli (including Fezzan), a process completed in Aug. 1914. In Cyrenaica they remained mainly on the defensive. General Ameglio, appointed governor of Cyrenaica towards the end of 1913, had however begun a vigorous campaign against the Senussites, when in Feb. 1914, in consequence of the threatening situation in the Balkans, orders were issued from Rome to suspend operations.

When the World War began, and while Italy still remained neutral, Turkish agents, with German support, sought to make Cyrenaica and Tripoli bases of action against the French and British. To the tribes which rose in revolt in Tripoli and its hinterland the Senussites gave some support, but Sidi Ahmad, through the intermediary of chiefs friendly to Italy, was conducting unofficial negotiations, and had the Italians been willing to acknowledge his independence an accommodation with them might have been reached. He refused however to accept the position of "a protected Bey." By the spring of 1915 he was again attacking Italian posts. Strong efforts had been made for some time by the Turks and their German advisers to induce the Senussites to invade western Egypt; a special Turkish mission now visited Sidi Ahmad and endeavoured to get him to proclaim a *jihad*. The Senussi sheikh was disinclined to take the advice offered him. The Senussites had always maintained good relations with Egypt—for much of their trade they were dependent upon the good-will of the Egyptian authorities. It was the demonstration that the Turco-Germans could give him substantial military and financial aid which finally changed Sidi Ahmad's views. A large number of Turkish officers and some Arabic-speaking German officers from the German garrison at Constantinople were smuggled into Cyrenaica, a matter of little difficulty. Among the arrivals was Nuri Bey, a half brother of Enver Pasha who exercised much influence. Nuri was joined in April 1915 by Ga'far Pasha, an Europeanized Arab of considerable ability, and with and after Ga'far came arms, ammunition and other stores, including wireless and telephonic apparatus.<sup>1</sup> By Aug. 1915 the Germans were using the landing places between Sollum and Tobruk as submarine bases. The time for putting the Turco-German plans into operation was approaching. These plans were, mainly through Senussite instrumentality, to threaten at once French north and central Africa, Nigeria, Egypt and the Anglo-Egyptian Sudan. It was also designed to penetrate to Cameroon and establish land communication between the Mediterranean and the Gulf of Guinea. The German Emperor, as "Islam's Protector," exhorted Sidi Ahmad to "expel infidels from territory which belonged to true believers." But besides the Senussi sheikh the only important chief won over to the cause was 'Ali Dinar, Sultan of Darfur, a tributary state of the Anglo-Egyptian Sudan, and the plan failed.

French determination to secure their position in the central Sudan contributed largely to the localization of the conflict. In 1909-10 the French had conquered Wadai (see 28.225), which adjoins Darfur, thereby withdrawing from the Senussite sphere a country in which they had been all powerful. In 1913, pushing N. from Kanem into the Saharan borderland, Colonel Lergaux conquered Borku, capturing 'Ain Galakka, the Senussite south-

ern base, in November, of that year. In the middle of 1914 Bardai, the chief settlement in the Tibesti highlands, was occupied.<sup>2</sup> These newly conquered regions on the southern fringe of the Libyan Desert were placed under the control of Lt.-Col. J. Tilho. Though risings against their authority by chiefs acting on Senussite instructions, and raids by nomads continued up to the early months of 1917, the French posts formed an effective barrier against any Senussite advance into central Africa.

*Campaign in Western Egypt.*—Since May 1915 the danger of a Senussite invasion of western Egypt had existed. It was due to the great tact with which Lt.-Col. C. L. Snow,<sup>3</sup> who commanded the small force stationed in western Egypt, handled a very delicate situation that the rupture with the Senussites was delayed till Nov. 1915. At the last moment, early in November, a final effort was made to avoid a break, Sidi Mohammed el Idris, Senussite envoy in Egypt, being sent to Cyrenaica to arrange for the Senussi sheikh "to get rid of his Turkish advisers in return for a sum of money." It was too late; Sidi Ahmad was already well supplied with German gold as well as arms.

The enemy plan of campaign was to advance in parallel lines with two forces, one across the Libyan plateau,—a great limestone tableland—the other farther S. along the string of oases leading from Siwa to the Nile. Simultaneously the Sultan of Darfur was to rise in revolt, invade Kordofan and advance on Khartoum. The plan was boldly conceived, but the danger to Egypt and the Sudan was not chiefly in the military force at the command of the Senussi sheikh and his allies. That danger lay in the spiritual authority exercised by Sidi Ahmad and the high prestige he enjoyed in Egypt. Many if not most of the 200,000 Bedouins of western Egypt were adherents of the Senussi sect and should the Senussi forces gain any striking success it "might lead to serious religious and internal disorders." So wrote Gen. Sir John Maxwell, then commanding the forces in Egypt, who added that the Senussi peril was his principal source of anxiety—not the Turkish attack on the Suez Canal.

The opening of the campaign was accompanied by great activity by German submarines off the Cyrenaican coast and in the Gulf of Sollum; among the boats sunk were the British auxiliary cruiser "Tara" and the horse transport "Moorina." Survivors of the crews were handed over to the Senussi and suffered great privations (Cyrenaica is a very desolate country and the Senussites themselves were often short of food). Land hostilities began on Nov. 15 but in view of the isolation and smallness of the Egyptian garrisons at Sollum and other advanced posts they were withdrawn, and a stretch of country 200 m. or more in length was at once overrun by the Senussites. They advanced as far as Dabya (90 m. W. of Alexandria and the terminus of the railway along the coast), sweeping past, but not attacking Mersa Matruh, the chief port of western Egypt and reached by boat from Alexandria in 12 hours. This port was made the base for the British operations.

General Maxwell's endeavour, in view of the internal situation, was to avoid anything in the nature of a reverse, to keep the enemy as far as possible from the Nile valley, and, as soon as possible, to strike a decisive blow at the Senussi and by his defeat to diminish his influence as a spiritual potentate. These aims were achieved, but at the outset the difficulty was to get together a force strong enough to undertake operation. In Aug. 1915, when the situation on the western Egyptian frontier became critical, the Gallipoli campaign was being vigorously prosecuted, while the Turks had again advanced towards the Suez Canal. When the Senussi invasion occurred the decision to evacuate Gallipoli had not yet been taken, while the British Government had just committed itself to the Salonika campaign. In these circumstances Sir John Maxwell had to content himself with collecting a "scratch" force to oppose the Senussi. The strength

<sup>2</sup> Turkish troops had occupied Tibesti in 1910 and Borku in 1911. They were recalled at the outbreak of the war with Italy.

<sup>1</sup> The German political agent was a certain Mannismann, who after the defeat of Sidi Ahmad endeavoured to persuade the Senussites to continue the war. He was attacked and killed in the desert by tribesmen hostile to Ahmad.

<sup>3</sup> Col. Snow was killed in the first action (Dec. 11 1915) by an Arab whom he was endeavouring to persuade to surrender. He had served over 20 years in the Egyptian coastguard and was intimately acquainted with the desert tribes.

of the Senussi is conjectural. The Turkish troops with them may have numbered 1,000; the *Muhafiza* or Senussite regulars were perhaps 5,000 strong. In addition there was an irregular body of tribesmen, Arabs and Arabized Berbers, probably numbering 20,000, all well armed and accustomed to desert warfare, but undisciplined and untrustworthy. The Senussites were well supplied with rifles and small-arms munitions; they had field guns and machine-guns; they had an ample camel transport and many of their troops were well mounted. With them were about 100 Europeans; Ga'far Pasha was commander-in-chief, and was accompanied by Sidi Ahmad and Nuri Bey.

Through bad leadership, or from other causes not explained, the Senussi offensive was not carried out as planned. When the advance across the Libyan plateau was made, Siwa oasis was also occupied; but no further progress towards the Nile by that route was then attempted. Moreover, 'Ali Dinar of Darfur, who had formally renounced his allegiance to the Sudan Government in April 1915, while preaching a *jihad* and indulging in abusive letter writing,<sup>1</sup> did not carry out his threat of invasion. Thrift at the outset the British had to deal only with the enemy advance along the Mediterranean coast.

Orders for the formation of a Western Frontier Force were issued on Nov. 20. Maj.-Gen. A. Wallace, who was given the command, took up his headquarters at Matruh on Dec. 7. His troops consisted of Yeomanry, Territorials, Australians, New Zealanders, Indians and Egyptians, with a squadron of armoured cars and a squadron of aeroplanes. The striking force was a composite mounted brigade under Brig.-Gen. J. D. T. Tyndale Biscoe and a composite infantry brigade under Brig.-Gen. the Earl of Lucan. "Regiments and staff had been collected," wrote Sir John Maxwell, "somewhat hastily. . . . The composite yeomanry brigade contained men from 20 or more different regiments. . . . It was not until the middle of Feb. (1916) that the condition of the Western Frontier Force could be considered really satisfactory."

The Senussites were engaged on Dec. 11 and 13 in the neighbourhood of Matruh with indecisive result. Having received reinforcements, General Wallace again engaged the enemy, on Christmas Day, at Gebel Medwa, a few miles from the coast. The Senussites, severely handled, retreated to Halazin (officially misspelt Hazalin), 25 m. S.W. of Matruh. Torrential rains now interrupted operations; in any case General Wallace was too weak to resume the offensive until further reinforced. The first of these new reinforcements consisted of the 2nd Regt. of the 1st South African Infantry Brigade, which disembarked at Matruh on Jan. 20 and 21 1916. They were the first S. Africans from the Union to take part in the war outside the limits of S. Africa.<sup>2</sup> On Jan. 23 the Senussites were attacked at Halazin and after an eight-hours' stubborn engagement were defeated and fled. The country had been turned by the rains into a quagmire and mud played an important and unfortunate part throughout. General Wallace's successes now induced many of the Egyptian Bedouin (mostly the Walad 'Ali tribesmen) to desert the Senussi cause. Wallace had been tied to his base at Matruh by lack of sufficient camel transport, but by February this difficulty was overcome and the force had been further strengthened, partly by more South African infantry. The time for a real offensive had come. At this period General Wallace resigned and was succeeded by Maj.-Gen. W. E. Peyton (Feb. 9 1916).

On Feb. 20 General Peyton sent forward a force under Brig.-Gen. H. T. Lukin (commander of the 1st S. African Inf. Brig.) with orders to take Barrini, 50 m. E. of Sollum. On the 26th an engagement was fought at Agagia, in which Ga'far Pasha attempted to carry out his favourite manoeuvre—an enveloping movement. This movement was checked, the infantry pressed forward and after a two-hours' struggle the Senussites were compelled to evacuate their position. The yeomanry were then sent in pursuit, and the Dorset Regiment (under Col. H. M.

Souter) in a fine charge broke into the enemy lines and captured Ga'far Pasha.<sup>3</sup> Nuri Bey took over the command of the Senussi forces, which offered little further resistance. Two British columns advanced on Sollum, which was reoccupied on March 14. Sollum is close to the Cyrenaican frontier and into Cyrenaica, that is into Italian territory, Nuri Bey and his forces retreated after blowing up their main ammunition dump. General Peyton did not further pursue Nuri, but on March 17 a squadron of armoured cars, under Major the Duke of Westminster, raced 120 m. across the desert and rescued the survivors—some 90 in number—of the "Tara" and "Moorina." Shortly afterwards General Peyton's force was reduced, the S. Africans leaving in April for France.

Sidi Ahmad had been with Ga'far Pasha until the end of Jan. 1916. He then went to Siwa and began the advance along the oases that lead to the Nile. The advance came too late to be effective, but on Feb. 11 Senussites occupied Baharia oasis, some 100 m. from the fertile and densely peopled districts of Fayum and Minia. Before the end of February the Senussites had also occupied the more southerly oases of Farafra and Dakhla. Thereupon the Egyptian officials were withdrawn from Kharga (the Great Oasis), which is connected by railway with the Nile valley, and the Senussites proceeded to occupy it. The strategical importance of the oases is great, but having no troops available for an offensive in S.W. Egypt, General Maxwell took defensive measures only. A command under Maj.-Gen. J. Adye patrolled the region from the Fayum to Assiut and Esna. The oases were kept under constant observation by aeroplanes, and the Senussites did not emerge from them. After the complete defeat of their northern force they abandoned Kharga, which was reoccupied by the British on April 15 1916. Gen. Sir Archibald Murray had meanwhile (March 19) succeeded General Maxwell in the Egyptian command.

*Darfur Campaign.*—At this period, in the Sudan, the Sirdar, Gen. Sir Reginald Wingate, was dealing with 'Ali Dinar of Darfur. For over a year the Sultan had been openly defiant and since Dec. 1915 had been making arrangements to invade Kordofan. As the Sudan Government had not in 1915 any force available for action in Darfur, negotiations were entered into with him, but without result, and the belief grew in the Sudan that the Government was too weak to deal with so powerful a sultan ('Ali Dinar had a regular "slave" army some 10,000 in number, for the most part well armed). Early in 1916 it had become imperative to clear up the situation if the general peace of the Sudan was to be preserved. Though it was the worst season of the year for military operations the Sirdar determined to anticipate 'Ali Dinar's offensive. An expeditionary force, 3,000 strong, was organized under command of Maj. (temporary Lt.-Col.) P. V. Kelly. Except for a detachment of the R.F.C. the troops consisted entirely of units of the Egyptian army—this being the first time since the *Mahdia* that Egyptian troops had fought Sudanese Arabs. The expedition was highly successful. It was remarkable for the manner in which transport difficulties were overcome. Khartum, the base, is 500 m. by rail from the nearest seaport: El Obeid, railhead, is 428 m. from Khartum; and from El Obeid the force had to advance nearly 400 m. across a desolate roadless country. It then had to engage a numerically superior enemy of indomitable valour. Battle was given by the Darfurians on May 22 (1916) at Beringa, near El Fasher, 'Ali Dinar's capital. A body of 2,000 riflemen, supported by a large mounted force, attacked the Egyptians with all the accustomed bravery of the Dervish warrior. They were beaten back, counter-charged and completely defeated, losing

<sup>1</sup> Like many other Arab officers and men in the Turkish army who fell into the hands of the British, Ga'far Pasha joined the Arab forces under the Emir Faisal and took part in the Syrian campaign against the Turks. After his capture at Agagia he had been confined in the citadel at Cairo. He tried to escape by means of a rope. Ga'far being a very heavy man, the rope broke; he fell, injured himself, and was removed to hospital. While there, he learned of the Sherif of Mecca's revolt and resolved to join his forces. In 1920 he became Minister of Defence in the Provisional Arab Government of Mesopotamia. He was a delegate at the Near East Conference held in Cairo in March 1921.

<sup>1</sup> He addressed one letter to "The Governor of Hell in Kordofan and the Inspector of Flames in Nahud."

<sup>2</sup> A volunteer force raised in Rhodesia (the 2nd Rhodesian Regt.) had gone to E. Africa in 1915.

over 50% of their number in killed alone. 'Ali Dinar and a considerable following of horsemen fled from the field. The party was chased and bombed by airmen, but the Sultan made good his escape. He retired to the confines of French central Africa. In Oct. 1916 a column was sent against him; he again fled, was pursued and killed in action on Nov. 6.

*The Siwa Defeat.*—In the oases west of the Nile (where Maj.-Gen. W. A. Watson had taken over the command) there was little change between April and Oct. 1916. The patrolling of the desert front, over 800 m. in length, was done by light motor-cars, the Imperial Camel Corps and aeroplanes. In October, the British, with slight opposition, reoccupied Dakhla oasis, where Sidi Ahmad had a farm and where he had been living for some months. From Dakhla a daring attempt was made by a party of British, in motor-cars, to reconnoitre Kufra, but it was found impossible to cross the belt of sand dunes west of the oasis.

Sidi Ahmad now retired by way of Farfara and Baharia oases to Siwa. As long as he remained there he was not utterly discredited in the eyes of the Egyptians. It was therefore decided to attack Siwa with a force sent in motor-cars from Matruh. The distance to be covered was 150 m., but the ground was for the most part hard. Leaving Matruh on Feb. 1 1917, the armoured-car force, under Brig.-Gen. H. W. Hodgson, reached the escarpment, below which lies Siwa oasis, the next afternoon, and was in action the whole of Feb. 3. The Senussites were about 1,000 strong, including 800 riflemen, and had mountain and machine-guns. An attempt to rush the cars was frustrated, but the action appeared to be indecisive. However, at daybreak the next morning the Senussites, having blown up their ammunition, retreated west. The head of their column was ambushed, but the main body got away. Sidi Ahmad, with Mohammed Salih (ex-commander of the Egyptian coastguard, who had deserted at the beginning of the campaign), had already fled to Jarabub (the oasis in which is the mosque-tomb of the founder of the Senussite fraternity). Thither he was not pursued, and in the Kufra oases he had a practically inaccessible place of refuge.

Nevertheless, with the defeat of Siwa the danger to Egypt from the Senussi movement disappeared and though raids were made on the Darfur border they did not seriously affect the Sudan. In Cyrenaica, too, the situation was altered. An Anglo-Italian agreement had been concluded in July 1916 for common action against the Senussi and it was in contemplation to transfer from the Egyptian to the Italian sphere Jarabub and that part of the Libyan Desert containing Kufra.

*An Understanding with Italy.*—During 1917 and 1918 Turkish and German influence among the Senussites steadily declined while strong efforts were made by the Italians to come to an understanding with the sect. They secured the release of 700 Italian soldiers, prisoners of war. Sidi Mohammed el Idris, the former envoy to Egypt, and the eldest son of Senussi el Mahdi, had disapproved his cousin's action and had taken no part in the invasion of Egypt. He had an influential following and was desirous of peace with both Italy and Great Britain. After the fight at Siwa he entered into an agreement with both Powers. Sidi Ahmad himself was deeply committed to his Turkish and German counsellors. Many of these, including Nuri Bey, had left Cyrenaica. In the summer of 1918 the Idrisi party gained the mastery in the Senussite ranks. Sidi Ahmad's position was undermined and he found it convenient to quit Cyrenaica. In August of that year he was conveyed by a German submarine from Misurata to Polo, whence he went to Turkey, still claiming to be the head of the brotherhood. In 1919 he "girded the Sultan with the sword of 'Othman" but in 1920 had turned Nationalist and aided Mustafa Kemal.

The Senussi chiefs in Libya had chosen Sidi Mohammed el Idris as Grand Senussi, and the new head of the order in Jan. 1919 sent a mission to Rome, when Italian sovereignty was implicitly recognized. Neither Italy, France or Great Britain had challenged the right of the Senussi sheikh to exercise spiritual authority over the members of the brotherhood; Italy in 1917 had gone further and had acknowledged Sidi Mohammed's temporal authority in what may be called his hereditary domin-

ions. By the accord of Regima concluded Nov. 1920 the 1917 agreement was ratified and Sidi Mohammed, to whom the Italians gave the title of emir (prince), himself visited Rome to pay homage to the King of Italy. An indication of Sidi Mohammed's attitude was the permission he granted at this time to an English woman to visit Kufra, though in the guise of a Moslem. The lady in question, Mrs. Rosita Forbes, testified to the desire of the Senussi chiefs to resume trade with Egypt.

**SERBIA** (see 24.686) had in 1910 an area of 48,303 sq. km., which after the Balkan wars was increased to 87,358 sq. kilometres. The pop., according to the census taken on Dec. 31 1910, was 2,911,701, showing an increase of 417,931 over that of 1900. The country was divided into 18 districts, as follows: (the pop. is shown in brackets):—Belgrade<sup>1</sup> (155,815), Belgrade City (89,876), Valjevo (157,648), Vranja (252,937), Kragujevac (189,025), Kraljina (112,142), Kruševac (167,371), Morava (203,638), Niš (108,768), Pirot (112,314), Podrina (238,275), Požarevac (259,906), Rudnik (85,340), Smederevo (143,216), Timok (149,538), Toplica (110,216), Užice (146,763), Čačak (138,911). Of this total pop. 2,528,819 lived in the country, and only 382,882 in towns. Of these the most populous were Belgrade (89,876), Niš (24,949), Kragujevac (18,452), Leskovac (14,236), Požarevac (13,411), Šabac (12,100), Vranja (11,439), Pirot (10,737). In 1900 the density of population was 51.6 per sq. kilometre.

The territory acquired by Serbia in the wars of 1912-3 contained (according to not very reliable statistics) a pop. of 1,481,614, divided among the following 12 districts:—Prijepele (49,315), Raša (81,214), Zvečan (81,643), Kosovo (193,337), Prizren (124,101), Tetovo (146,803), Skopje (Ušub, 157,078), Kumanovo (144,983), Bregalnica (101,442), Tikveš (84,657), Bitolj (Monastir, 252,646), Ohrida (84,395).

Thus Serbia on the eve of the World War had a pop. of roughly 4,500,000. The births, deaths, and marriages in Serbia amounted in 1911 and 1912 to 107,219 and 114,257, to 64,369 and 63,358, and to 30,420 and 13,289 respectively.

*Agriculture.*—Serbia is a land of small holdings, the former Turkish proprietors having been expropriated in 1833 and 1880: in 1900, out of a total of 401,093 families, no less than 91.5% were owners of land. Of these only 86 persons owned over 100 hectares of land, and only three persons over 300, while there were 98,253 properties (33.4%) of under three hectares. There has been a very rapid development of coöperative societies since 1895 (900 in 1909, with 35,000 members; 1,200 in 1913, with 40,000 members).

Of a total area of 2,045,176 hectares there was in 1905 (a) cultivated land 1,223,671 (arable land 1,027,815, gardens 25,815, vineyards 33,101, orchards 136,939); (b) grazing land 418,391; (c) commons and uncultivated land 110,101. In 1908 the chief products of the harvest were (in tons) maize 533,691, cereals 457,734, hay and clover 226,858, straw 777,728, plums 530,061, potatoes 54,946. In 1905 (latest statistics available) the live stock was distributed as follows: horses 174,363, cattle 969,953, pigs 908,580, sheep 3,160,166, goats 510,063.

*Forests.*—Over one-third of Serbia's total area (3,750,000 ac.) is forest land, all but 750,000 ac. of this belonging to the State or the various communes. The chief varieties of tree are beech (750,000 ac.), oak and conifers.

*Mines.*—The mining industry of Serbia has a great future, but has hitherto been but little developed, owing to lack of capital and means of transport. Table I gives the export of ores (in metric tons) according to the last statistics available. That these are merely the first primitive beginnings is best shown by the fact that in the year

<sup>1</sup> The phonetic spellings of the names of the districts and towns, following the system adopted by the Committee of the Royal Geographical Society, are: Belgrade, Valjevo, Vranja, Kragujevac, Kraljina, Kruševac, Morava, Niš, Pirot, Podrina, Požarevac, Rudnik, Smederevo, Timok, Toplica, Užitice, Čačak, Leskovac, Šabac, Prijepele, Raša, Zvečan, Kosovo, Prizren, Tetovo, Skopje, Kumanovo, Bregalnica, Tikveš, Ohrida. The spellings given above follow the Croatian form or its equivalent.

TABLE 1.—Exports of Ores.

	1904	1906	1908
Coal and Lignite . . .	2,631,810	2,375,067	296,125
Gold (in kilogrammes) . .	89	139	191
Silver " " " " . . .	48	3	823
Black copper . . .	1,641	7,613	2,198
Lead . . .	245	213	1,552

Russia . . .	77,294	72,925	815	541

of over 21,400,000 francs was exported. The famous plum industry (known to the west only through German intermediaries) accounted in 1908 for the export of 49,042 tons of prunes (value 10,350,721 francs) and of 14,398 tons of plum jam (value 3,251,093 francs). The pig trade, upon which Serbia's prosperity very largely depended, having been injured by Austria-Hungary's tariff policy, a new system of slaughter-houses was established in Belgrade, and in 1911 the chief of these exported 9,751 tons of pork (68,047 head). By 1913 the amount exported had risen to 12,913 tons (100,776 head).

*Finance.*—On Jan. 1 1913 the public debt amounted to £26,362,240. Table 4 shows how the budget balanced in the years before the war. In 1915 the budget was fixed at the same figure. From 1915 to 1918, owing to the conquest of the country, no proper budget was possible, the Government and army subsisting upon the subsidies of the Allied Powers.

TABLE 4.—Finance.

	Revenue	Expenditure	Surplus
1909 . . .	£4,145,764	£4,132,945	£12,818

1911 . . .	4,805,458	4,803,272	2,186
1912 . . .		4,972,758	
1913 . . .		5,230,588	
1914 . . .		8,572,826	

*Education.*—In 1909 there were only 1,296 elementary schools in Serbia with 2,584 teachers and 138,434 pupils, and 20 secondary schools with 393 teachers and 7,317 pupils. In 1910-11 the university of Belgrade had 1,025 students. Only 27% of the pop. could read and write.

*Army.*—After 1908 great efforts were made to increase the efficiency of the army. Organized under a system of obligatory service, the war strength in 1914 was estimated at 350,000 men, which, with the addition of the Landsturm, could be raised to about 400,000. (See ARMY: *Balkan Armies*.)

#### POLITICAL HISTORY, 1909-18

The annexation of Bosnia by Austria-Hungary in 1908 marked a turning point in the history of Serbia. Henceforth public opinion, supported by prominent statesmen in every party, was practically unanimous in regarding a conflict with Austria-Hungary as sooner or later inevitable. This belief had at once a national and an economic basis: for Count Aehrenthal not merely supported the Hungarian policy of repressing Yugoslav national aspirations inside the Dual Monarchy, but obstructed Serbia's commercial development by tariff and frontier restrictions, by a veto upon either direct access to the sea or a common frontier with Montenegro, and by opposition to all idea of Balkan coöperation. Those Serbs who feared so unequal a conflict

and would have preferred a more conciliatory attitude towards Austria-Hungary, were reduced to silence by Aehrenthal's refusal to admit the international aspect of the problem or to consider the Serbian proposals for arbitration before the Hague Tribunal. Isolated in Europe and jealously shut off from her natural outlets on the Adriatic, Serbia was driven to seek new political and economic ties in the east and south. The policy of Aehrenthal inevitably strengthened the tendencies towards the creation of a Balkan League, and these were accelerated by the political unrest evoked throughout the Balkan Peninsula by the Young Turk Revolution.

*The Balkan League.*—The idea of a Balkan League was by no means new. It had been advocated as early as 1844 by the Serbian statesman Garašanin, and formed the subject of serious negotiations between Prince Michael Obrenović and the Bulgarian exiles of his day, and also between Kossuth, Prince Michael, and Prince Cuza of Rumania. The last serious overtures had been made in 1891 by the Greek premier Tricoupis, and after their betrayal to the Porte by Stambulou the idea remained dormant for nearly 20 years. The speech of the Russian Foreign Minister Isvolski on Christmas Day 1908, advocating a league between Turkey and the three Balkan Slav States, inaugurated a new era of Russian activity in the Balkans, under the active direction of Tcharikov, the ambassador at Constantinople, and Hartwig, who rapidly acquired great influence as minister at Belgrade. In the spring of 1910 the kings of Bulgaria and Serbia paid successive visits to St. Petersburg and Constantinople, and Dr. Milovanović, the Serbian Foreign Minister, was especially active in his endeavours to secure the adhesion of Turkey to a general Balkan League. His views were also shared by Venizelos, who came into power in Greece in October of the same year, and even to a lesser degree by Gešov, a Russophile, who became Bulgarian premier in March 1911. In view, however, of the increasingly chauvinistic attitude of the Young Turk regime in Macedonia and Albania, Venizelos considered it advisable to make overtures to Bulgaria, with a view to common defensive action against a possible Turkish attack. His initiative led to important secret negotiations, in which Mr. J. D. Bourchier, *The Times* correspondent, acted as intermediary. These preceded by at least five months the first conversations between Serbia and Bulgaria, which appear to have originated from an overture made by Rizov in Belgrade at the instance of King Ferdinand.<sup>1</sup> On Oct. 11 1911 Gešov, on his return from the west, had a long discussion with Milovanović in the train between Belgrade and Nish, and secret negotiations continued throughout the winter. The coming of age of Prince Boris of Bulgaria in Feb. 1912 was attended by the crown princes of Serbia, Montenegro, Greece and Rumania, and this demonstration was widely regarded as a symbol of increasing coöperation between the Christian States of the peninsula. On March 13 1912 a secret treaty of alliance was concluded between Serbia and Bulgaria, and was supplemented on May 12 by a military convention. On May 29 a similar treaty was concluded between Bulgaria and Greece. There was no actual treaty binding Serbia and Greece, while the Serbo-Montenegrin treaty, concluded as late as Sept. 1912, was less political than military and provided for separate though parallel action.

*The Treaties.*—By the terms of the Serbo-Bulgarian agreement each State was bound to assist the other with all its forces, in the event of an attack by one or more States unspecified, and in particular in the event of any Great Power trying to annex any portion of Turkey's Balkan possessions. If internal troubles should arise in Turkey, either ally might initiate proposals for military action, and any point upon which agreement was not reached, should then be referred to Russia for decision. Special provision was made for possible conquests, Serbia recognizing Bulgaria's rights over the territory lying east of the Rhodope Mountains and the Struma river, and Bulgaria similarly recognizing Serbia's rights north and west of the Šar (Shar) Mountains. The districts lying between these limits,

<sup>1</sup> See *Samouprava*, Oct. 28 1913.

the Aegean and the Lake of Okhrida, were to form "a distinct autonomous province"; but should their partition prove inevitable, then Serbia undertook to make no claim beyond a line drawn from the Lake of Okhrida to near Kriva Palanka on the old Turco-Bulgarian frontier and including Skoplje, but not Monastir, Prilep or Veles. In the event of a dispute, the Tsar was to act as arbitrator, and Bulgaria undertook to accept the more southerly line as its new frontier with Serbia, if the Tsar should decide in favour of the latter. In the event of war, Bulgaria undertook to place at least 200,000 men at least 150,000 men in the field against Turkey. If either Turkey or Rumania attacked Bulgaria, Serbia was to send 100,000 men to her aid; while Bulgaria on her part must provide 200,000 men in support of Serbia, in the event of an attack by Austria-Hungary.<sup>1</sup> The treaty between Bulgaria and Greece was much more indefinite, though it provided for mutual aid against Turkey, not merely in case of direct military aggression, but also of the infringement of treaty rights and of the principles of international law—a phrase which was of course intended to cover the championship of co-nationals in Macedonia or Thrace against Ottoman misrule.

No attempt was made to define the territorial claims of the two countries in the event of a successful war, and the division of the spoils was thus left to the chance of a future agreement. The military convention was not concluded till Sept. 22, when events were already moving rapidly. By it Greece undertook to provide at least 120,000 men against Turkey, while Bulgaria increased the contingent already promised in her agreement with Serbia to 300,000 men. Special clauses provided for a blockade of the Aegean by the Greek fleet, and forbade the conclusion of peace or even of an armistice without the consent of all the allies.

*The League, Turkey and the Powers.*—Internal disorder had spread rapidly throughout Turkey in Europe in the year following Italy's invasion of Tripoli: and the ferocious policy of suppression adopted by the Committee of Union and Progress towards all the non-Turkish nationalities culminated in a reign of terror at the parliamentary elections of 1912, in a recrudescence of Komitaji activities, and in an Albanian rising even more widespread and more determined than in the two previous summers. The premature death of Milovanović on July 1 not merely deprived Serbia of her ablest modern statesman, but removed one of the few restraining influences in any Balkan capital. He was succeeded as premier by Tričević, and in the conduct of foreign affairs by the Old Radical leader Pašić, who placed almost unreserved reliance on Russian support and worked in the closest accord with Hartwig. On Sept. 12 Pašić became premier at the head of a purely Old Radical Cabinet.

By this time not even the most pacific statesmanship could have arrested the growing anarchy in Turkey. Public opinion in Belgrade and Sofia was roused by a massacre of Bulgarians at Kočana (Kochana) on Aug. 1, and by the report of similar outrages in the Sanjak. By the middle of the month, Uskub, and the entire district recognized by the secret treaty as Serbian, were in the hands of the insurgent Albanians; and the concessions granted by the Porte, while failing to arrest the movement, only served as an incentive to swift action on the part of the neighbouring States.

The somewhat vague proposals for decentralization and administrative reform put forward by Count Berchtold on Aug. 20 prompted the Balkan allies to hasten their preparations. While the slow-moving concert of Europe was discussing alternative proposals for Turkish reform, the Porte suddenly held up Serbian war material at Salonika and began to mass troops round Adrianople. Before any collective step had been taken by the Powers, the situation was gravely compromised by the almost simultaneous mobilization of the Bulgarian, Serbian, Greek

and Turkish armies (Oct. 1). At the last moment the Porte announced its intention to enforce the Vilayet Law of 1880, which had been allowed to remain on paper for a whole generation. But this was very naturally regarded by the Balkan allies merely as a fresh attempt at evasion, and the Powers still further alarmed them by a note which, in its endeavours to soothe Turkish susceptibilities, laid far more stress upon Turkish territorial integrity and sovereign rights than upon the cause of reform. Simultaneously the Powers warned the four Balkan States against warlike action and assured them that even in the event of victory no change in the territorial *status quo* would be tolerated. The further announcement of their intention—after a lapse of 34 years—to enforce the Treaty of Berlin, decided the four allies to precipitate events, and before the impending note could be formally communicated, the King of Montenegro, by an act of undoubted collusion, declared war upon Turkey. On Oct. 13 the other three Balkan Governments presented to the Porte a series of far-reaching demands, culminating in racial autonomy for all the nationalities of the Ottoman Empire, and four days later the Turks, without deigning to answer, declared war on Serbia and Bulgaria. (For the military events, see BALKAN WARS.) All the Great Powers, though for quite divergent reasons, genuinely attempted to prevent war. This is equally true of Russia, who, though privy to most of the designs of the Balkan allies, disapproved because she could not wholly control the time and method of action, and of Austria-Hungary, to whom the existence of an anti-Austrian clause in the treaty had been betrayed, but who already reckoned confidently upon setting the allies at variance before it could come into operation. That the Powers, having failed to prevent war, adopted a passive attitude during its early stages, was due to the almost universal assumption in official circles that the Turks would be victorious, and that the refractory Balkan States would soon be only too glad to accept a settlement dictated from without.

*The First Balkan War.*—The rapid and overwhelming success of the allies radically transformed the situation. By the end of November Turkish rule in Europe was restricted to the Chatalja lines, the Gallipoli Peninsula, and the three fortresses of Adrianople, Janina (Yannina) and Scutari. The Serbs in particular, after the victories of Kumanovo and Monastir, were in actual occupation of all Macedonia west of the Vardar, and had reached the Adriatic at Durazzo and Medua. They were thus able to go far beyond their obligations under the military convention, by help to the Bulgarians investing Adrianople.

Kumanovo was much more than an ordinary victory. It restored to Serbia that self-confidence which had been so gravely shaken by the rebuffs and scandals of the previous 30 years: and throughout the Yugoslav provinces of Austria-Hungary it was hailed as an atonement for Serbia's downfall on the field of Kosovo, and as a pledge of her new mission as the Southern Slav Piedmont. In Croatia especially, where the Hungarian Government had suspended the constitution and established Cuvaj as dictator, there were continual demonstrations in favour of the Balkan allies, even on the part of sections of the population hitherto regarded as Serbophobe. Austria-Hungary at first adopted a waiting attitude, but as the Serbs approached the Adriatic, she suddenly ordered a general mobilization, and suppressed all public expressions of feeling, while the official press of Vienna and Budapest adopted a menacing tone towards Serbia. Great prominence was given to the alleged insults offered to Herr Prochaska, Austro-Hungarian consul at Prizren, and for some days public opinion was allowed to believe that he had been shamefully mutilated by Serbian officers. It only transpired at a much later date that Prochaska, known to be in touch with the open enemies of Serbia in the Sanjak, had been entirely unmolested by the invaders, but that on the other hand he had received definite instructions from Vienna to create an "incident" such as might provide a pretext for action. The Austro-Hungarian chief-of-staff and War Minister, Gens. Conrad and Auffenberg, are known to have favoured a radical solution of the Southern Slav question by

<sup>1</sup> Gešov in his *Memoirs* asserts that King Ferdinand in signing this was decided by his knowledge of the text of a secret Austro-Rumanian military convention, permitting Rumania in the event of war with Russia, to annex not only Bessarabia, but also Silistria, and even Ruščuk (Ruschuk), Šumla (Shumla) and Varna.

immediate war with Serbia (*see under AUSTRIAN EMPIRE: Foreign Policy*): and Count Forgács, who as minister in Belgrade, had supervised the anti-Serbian forgeries exposed at the Friedjung trial, was now permanent under-secretary at the Ballplatz and using all his influence with Count Berchtold in favour of war. There is practical certainty, however, that the Archduke Francis Ferdinand on this occasion supported Francis Joseph's aversion to war, and that the decisive factor was Italy's opposition to any "forward" policy from Vienna. As negotiations were already proceeding between Berlin, Vienna and Rome for a fifth renewal of the Triple Alliance (actually signed on Dec. 5 1912 for six years), Italy was able to use as a lever the special Austro-Italian agreement of 1909, by which Austria-Hungary had pledged herself to make no change in the Balkan *status quo*, "without a previous agreement with Italy, based on the principle of compensation." Moreover, Berlin, concerned for the Alliance, insisted strongly in Vienna upon the need for reassuring Rome by a more moderate attitude towards Serbia. The march of events had taken Vienna altogether by surprise, and in complying with its ally's wishes, it was influenced by the altered outlook of the Great Powers. On Oct. 8, in a last effort to avert war, they had warned the Balkan States that no territorial changes would be tolerated. But the success of the campaign and the general relief with which public opinion hailed the downfall of Turkish rule in Europe, soon led to a change in their attitude. On Oct. 30 M. Poincaré proposed a general declaration of *désintéressement* in territorial questions; and though this was rejected by Vienna, its moral effect was only increased when Mr. Asquith spoke in favour of recognizing the accomplished fact and remaking the map of eastern Europe. On Nov. 2 this view was strongly endorsed by M. Sazonov. For the moment all that Count Berchtold could do was to encourage Bulgarian designs on Constantinople and attempt to sow dissensions among the allies. The Turks, seeing themselves isolated in Europe, made overtures of peace as early as the 11th to King Ferdinand, who was not willing to consider them until his troops had been checked before Chatalja. On the 25th, however, negotiations were opened and resulted, not in peace, but in an armistice (Dec. 3) pending a general peace conference in London. When this opened at St. James's Palace on Dec. 16, Serbia was represented by the ex-premier and historian Novaković, the president of the Skupština Nikolić, and the minister in Paris, Vesnić. The wisdom of the allies in excluding Greece from the armistice soon became apparent: for her command of the sea limited the Turks to the Anatolian railway as the sole channel of reinforcement. In London Turkey pursued a policy of dilatory diplomatic intrigue and only receded inch by inch before the very drastic demands of the allies. After a month had been wasted, the Powers, with unexpected unanimity, presented a joint note to the Porte, advising the cession of Adrianople to Bulgaria and hinting at the loss of Constantinople as a possible consequence of renewed hostilities (Jan. 18 1913). Kiamil Pasha laid the proposals of the Powers before a specially convoked council of notables, and was on the point of yielding when the extremists of the Committee of Union and Progress overthrew his Cabinet and murdered the commander-in-chief, Nazim Pasha (Jan. 23). In view of the united front presented by the Powers, there can be little doubt that the new Cabinet would soon have been driven to the necessary concessions. But the Balkan delegates, rightly or wrongly, took the protestations of the Young Turks at their face value, and broke off the negotiations on Jan. 28. The council of ambassadors initiated by Sir Edward Grey continued to sit in London, and devoted especial attention to the Albanian problem and to the friction produced between Albanians and Serbs by the latter's presence on the Adriatic. Since the commandant of Scutari, Hasan Riza, declined to recognize the armistice, hostilities before the town had continued throughout Dec. and Jan., and Serbia sent repeated reinforcements to the aid of the Montenegrins.

*Resumed Hostilities.*—When war was resumed on Feb. 3 the brunt fell upon Bulgaria, and the Serbs, being complete masters

of Macedonia, were free to contribute 47,000 men and a siege train of 38 guns to the operations against Adrianople, which held out until March 26. The dispute which arose as to whether Shukri Pasha had surrendered to the Bulgarians or to the Serbs, was in itself quite unprofitable, but was a symptom of the friction which was daily increasing between the two allies. Gen. Stepanović, who commanded the Serbian contingent, was allowed to pass through Sofia with his staff, without a single greeting, and on April 16 Bulgaria renewed the armistice with Turkey, without waiting for her allies. The final phase of the war concentrated round Scutari, which Montenegro and Serbia made desperate efforts to reduce. Even the announcement that the council of ambassadors, in fixing the frontiers of the new Albanian State, had definitely included Scutari (while leaving Dibra, Prizren, Peć [Ipek] and Djakovo to the two Serb kingdoms) only served as an incentive to create if possible a *fresh fait accompli*. But Austria-Hungary upheld her veto, and on March 20 addressed a severe note to Montenegro, reproaching her for the murder of a Bosnian Franciscan and other incidents, and at the same time dispatched a strong naval squadron to the southern Adriatic. Her next step was to urge upon the Powers a collective demand for the cessation of hostilities and the withdrawal of the Montenegrin and Serbian forces from the territory assigned to Albania, and to threaten the use of force unless at least the civil population of Scutari were allowed to leave the town (March 23). This demand was supported by Britain, partly in order to avert a conflict, and was conceded: but the close support of Cetinje by Belgrade rendered the danger of Austro-Hungarian intervention increasingly acute. On March 31 the Powers ordered Montenegro to cease hostilities, and on her refusal established a naval blockade of her strip of coast. This seemingly illusory measure at least had the effect of restraining Austria-Hungary, who could not act separately so long as the Powers held together. It was, however, simply defied by King Nicholas, who gained time by consenting to the withdrawal of the Serbian troops and meanwhile closed the frontier and conducted secret negotiations with Essad Pasha, commandant of the town since the assassination of Hasan Riza on March 30. On April 23 Scutari surrendered to the Montenegrins, and the Powers had difficulty in restraining Austria-Hungary from immediate action. What finally decided her appears to have been the knowledge that her seizure of Mount Lovćen (Lovchen), the key to Cetinje, would be followed by Italy's occupation of Valona, with its control of the entrance to the Adriatic.

Amid the countless rival intrigues the Powers presented in public a unanimous front, and on May 14 the Montenegrins found themselves obliged to surrender Scutari to Adml. Burney, as commander of the international fleet. Negotiations could now be resumed in London for a general peace (May 20), and the Powers found it easier to take a strong line. Before the delegates could be brought to business, it was necessary for Sir E. Grey to inform them, with quite undiplomatic bluntness that unless they were prepared to conclude peace without further delay they had better leave London altogether. By the Treaty of London, which was signed on May 30 1913, and only contained seven brief articles, Turkey ceded to the four allies conjointly the island of Crete and all territory lying to the west of the Enos-Midia line, and all the contracting parties agreed to refer the settlement of Albania and the Aegean Islands to the five European Great Powers, and all financial questions to the International Commission convoked in Paris.

*The Dispute between the Allies.*—The Balkan allies were now faced by the thorny problem of dividing the spoils. Macedonian autonomy, which the treaty had laid down as the ideal solution, was from the first abandoned by all parties. Their success, as it had far exceeded their expectations, also increased their appetites and encouraged them to extend their claims. Thus while Serbia found herself in effective possession of most of Macedonia, and remembered the imperial traditions of Stephen Dušan, Bulgaria saw the possibility of acquiring Adrianople and Thrace, and not content with the "Big Bulgaria" of the

Treaty of San Stefano, dreamed of "the four seas" (the Adriatic as well as the Black, Aegean and Marmora). The four Governments seemed each bent upon annexing a maximum of territory, and thus too often became the tools of Powers whose ambitious plans of political and military equilibrium they had unconsciously upset. Above all, the long delays in restoring peace stabilized the various regimes of occupation and proved fatal to mutual understanding. Between Bulgaria and Greece there was no territorial bargain, and no obvious means of reaching one, while Serbia as early as Jan. 23 formally raised the question of a revision of the Serbo-Bulgarian treaty. This rested on the argument that Serbia was entitled to compensation for four reasons—(1) that she had furnished her ally with military support far in excess of her bargain, (2) that she had absolved Bulgaria from her military obligations in Macedonia, (3) that she had loyally continued the war three months after her own work was done, and (4) that the acquisition of Adrianople by Bulgaria radically modified the basis upon which the bargain rested. But if Serbia's attitude is to be justified, it must be on the broader ground that events had transformed the situation still further to her disadvantage in another direction. Her two parallel aims in the war had been the political liberation of her kinsmen under Turkish rule, and her own economic emancipation by means of free access to the sea; and from the practical rather than the sentimental standpoint the second was much the more vital. Her whole calculation centred upon securing the Sanjak, Kosovo and a link with Montenegro, and a port in northern Albania (as the best substitute for access through Herzegovina); and when Austria-Hungary imposed her veto upon the latter, the Vardar valley became Serbia's only possible alternative outlet, and this involved her retention of Veles, Prilep, Monastir and Ohrida as well as the "disputed zone." That Vienna deliberately aimed at thus embroiling Serbia and Bulgaria is shown by the fact that during the earlier Albanian negotiations Count Berchtold had offered to Serbia the whole of the Vardar valley with Salonika itself, if she would renounce her Adriatic claims. Bulgaria, on her side, insisted on the literal interpretation of the treaty and showed herself indifferent to Serbia's difficulties on the west.

Meanwhile Russia had made every effort to avert a conflict, Sazonov going so far as to express regret at the Serbo-Greek negotiations (April 17), while warning Bulgaria of possible danger from Rumania, in the event of aggression against Serbia (April 28). On April 30 the Russian ministers in Sofia and Belgrade simultaneously reminded the two allies of their obligation to submit disputes to Russian arbitration. But Sazonov's success in settling a Bulgaro-Rumanian frontier dispute had only served to render Sofia more unyielding, and on May 19 the Bulgarian commander-in-chief wrote to the premier, assuming war with Serbia and Greece to be inevitable, and urging concentration against the former. The pressure very rightly brought to bear by Sir E. Grey upon the peace delegates in favour of the Treaty of London was misinterpreted by the Bulgarians (who alone had any motive for haste) as a guarantee of that Treaty against Turkey, and as dispensing them from the need of guarding their eastern frontier. They were still further encouraged by the openly Serbophobic tone of the official press in Vienna and Budapest: and King Ferdinand had already ordered Gen. Savov to hasten the transference of the army from the Thracian to the Macedonian front, when on May 27 Pašić, under pressure from the Serbian opposition, publicly committed his Government to the demand for treaty revision. This hastened the resignation of the pacific Gešov, behind whose back King Ferdinand was already concerting aggressive action. Before he went, Gešov, under strong Russian pressure, met Pašić at Tsaribrod (June 1) and agreed to Russia's proposal for a meeting of Balkan premiers at St. Petersburg; but a further proposal for the immediate reduction of the allied armies to a third, though accepted by Serbia and Greece, failed owing to the impossible conditions put forward by Gen. Savov. Gešov's successor, Dr. Danev, opposed the meeting of the premiers, contended that Russia had already prejudged the case by even

considering revision, and relied increasingly upon Austria-Hungary. That his confidence was not ungrounded is shown by Count Berchtold's assurance to Rumania in May that the Dual Monarchy was ready to defend Bulgaria "even by force of arms."<sup>1</sup> Serbia and Greece on their part were fully alive to the danger; there had been informal talks between Venizelos and Novaković in London, and between Prince Alexander of Serbia and Prince Nicholas of Greece in January and March at Salonika. After the accession of King Constantine, a less conciliatory mood prevailed in Athens and Belgrade, each of whom in turn made secret overtures to Rumania for a defensive alliance, but without success (April 19, June 8). Their own agreement was hastened by the common danger, and the Serbo-Greek military convention of May 14 was revised on June 1 and supplemented by a definite treaty of alliance for 10 years. While the first of these provided for mutual military support in case of a Bulgarian attack upon either ally, the second extended the *casus foederis* to an attack by a third Power, "in circumstances envisaged by the Treaty of Alliance between Greece and Serbia." Both the wording and the events of the moment make it clear that the intention was to guard against an Austro-Hungarian attack upon Serbia; in 1913 King Constantine took this risk, but in 1915 he was to deny its application.

On June 8 the Russian Government made its supreme effort for peace, by inducing the Tsar to address a personal appeal to the kings of Serbia and Bulgaria, which closed with the warning that "the first to make war would be responsible before the Slav cause." King Peter's courteous though somewhat ambiguous answer was never published; but that of King Ferdinand, which threw the entire blame upon Serbia and argued that the Bulgarian claim had long been admitted by Russia, was a fresh blow to the cause of peace. On June 13 the Powers made a joint *démarche* at Sofia and Belgrade in favour of demobilization, but Bulgaria imposed the impossible condition of a preliminary joint occupation of the disputed territory. Her attitude stiffened still further after the speech of the new Hungarian premier, Count Tisza, who emphasized the right of the Balkan States to settle differences in their own way—even by war—and declared that Austria-Hungary could not allow any other Power to acquire special prerogatives in the peninsula (June 19). As a natural result, Russia's fresh proposals for a conference of Balkan premiers in St. Petersburg, while promptly accepted by Belgrade and Athens, were met by Dr. Danev with a reiterated demand for joint occupation, and a virtual ultimatum giving Russia a week in which to pronounce as arbiter and 48 hours to announce compliance with the request. With Sazonov's sharp reply bidding Bulgaria to expect nothing more from Russia, St. Petersburg's influence over Sofia may be said to have ended. Count Tarnowski, the Austro-Hungarian minister in Sofia, was supreme in the counsels of King Ferdinand during the critical fortnight that followed. The deadlock was complete, when on June 22 the Serbian Cabinet was driven to resign, owing to the resentment of the military party at its alleged moderation. The most it could do was to place itself unreservedly in Russia's hands, and when this was endorsed by the Skupština after a stormy secret session Pašić resumed office (June 26). But Russia was by this time powerless to avert the catastrophe.

*The Second Balkan War.*—On the night of June 29, without previous declaration of war, the Bulgarian armies made an almost simultaneous attack upon the Serbs and Greeks. Their extended order and lack of proper reserves showed how greatly they had underestimated their enemy, and Gen. Savov is credibly reported to have declared that he could cut through the Serbs like "a knife through rotten cheese." But the Serbian generalissimo, Gen. Putnik, was fully alive to the Bulgarian preparations, and in confidential orders to his commanding officers had warned them that the Bulgars would "use their amicable relations with us" for a surprise attack. In point of fact, on certain sectors those who carried out this "stab in the back" had been dining only a few hours earlier

<sup>1</sup> Prince Fürstenberg to Take Jonescu, who published the facts in *La Roumanie*, Dec. 15 1914.

with their Serbian comrades across the lines. It is probable that Savov did not aim at regular war, but hoped by a sudden shock to drive a wedge between Serbs and Greeks, seize the coveted districts of Macedonia and then hold them until the foreign intervention which he believed to be imminent should settle the dispute on a basis of "*beati possidentes*." This is borne out, not merely by captured despatches, but by the amazing fact that when Putnik's forces everywhere held their own, Savov on July 1 telegraphed the order to stop hostilities. But the war so lightly begun could no longer be stopped. That afternoon the Serbian counter-offensive opened, and a proclamation of King Peter, prepared some weeks previously in Belgrade, with a blank space for insertion of the date, was issued to the troops. The desperate struggle which continued almost uninterruptedly from July 1 to 9 is known as the battle of the Bregalnica (Bregalnitsa), though it actually extended over a much wider front. At its close the Bulgarians found themselves cut into two by the inaccessible Plaskovica Mts., and were obliged not merely to relax their hold upon the Vardar valley at Krivolak, but to abandon the whole Ovčepolje (Ovche Polye) district, the strategic key to central Macedonia.

It appears certain that the original attack took place without the knowledge of the Danev Cabinet and contrary to its unanimous decision.<sup>1</sup> But that the premier was contemplating war at an early date is shown by his request that Vienna should ascertain whether the Turcutia-Balčik (Balchik) line would buy Rumania's neutrality (June 28) and by his warning to the Rumanian minister that Serbian resistance would be over before Rumania could complete her mobilization (July 1). That there were two parallel policies in Sofia is further shown by the fact that on the very day of the request to Vienna the Rumanian Government officially informed Bulgaria that it would not remain neutral in the event of war. During the mutual recriminations that followed defeat, Dr. Danev publicly asserted (1) that Count Tarnowsky had already given assurances to King Ferdinand that Austro-Hungarian troops would re-occupy the Sanjak in the event of a Serbo-Bulgarian war, and (2) that on June 26 a treaty was signed between Austria-Hungary and Bulgaria, by which the latter bound herself, in the event of an Austro-Serbian or an Austro-Russian war, to mobilize enough troops to paralyse Serbia's action, while Austria-Hungary in her turn undertook to prevent, either by diplomatic or military action, any attack of Rumania upon Bulgaria in the event of the latter becoming involved in war with the allies, and even to intervene herself, should the war take a turn unfavourable to Bulgaria. These assertions have never been contradicted: the first coincides with the known facts, but for the second documentary evidence is as yet lacking. The memorandum addressed by Radoslavov and Genadiev to King Ferdinand on July 6—advocating a close accord with Austria-Hungary as the sole hope of averting disaster—neither proves nor disproves the existence of an alliance, for they may well have written in ignorance of a secret compact; but it should have served as an index to the attitude of those statesmen in 1915.

*The Treaty of Bucharest.*—By July 17 the Serbs had forced back the Bulgarians at all points to the frontier of 1912, and could henceforth adopt a mainly defensive attitude; but on July 16 Rumania declared war and began to throw troops across the Danube, while on July 15 the Porte repudiated the provisions of the Treaty of London and ordered Enver Pasha to advance upon Adrianople.

The frantic appeals of Sofia to the Powers to enforce upon Turkey respect for a treaty concluded under their auspices were disregarded, and Western public opinion was not inclined to save Bulgaria from the consequences of her own act. At the same time the entry of two new combatants greatly complicated Austria-Hungary's designs of intervention. She was held back by both her allies—Italy, who viewed with alarm the Balkan activities of any outside power and was determined to insist upon compensation, and Germany, who feared the loss of Rumania for the Triple Alliance, and the consequent derange-

ment of the military balance in Europe. William II. was further influenced by a triple personal motive—the appeal of his brother-in-law King Constantine, old friendship for King Charles, and active dislike for King Ferdinand. This momentary divergence of view between Vienna and Berlin sealed Bulgaria's fate: though Vienna and St. Petersburg united to hold back Rumania from occupying Soňa or claiming the Ruščuk (Ruschuk)—Varna line. Bulgaria had no course left but to sign an armistice on July 31 and to open peace negotiations at Bucharest with her four Christian neighbours. This apparent emancipation of the smaller Powers from the European concert's control decided Austria-Hungary in favour of belated action against Serbia. But on Aug. 9 the Italian Government made it clear to Vienna that it would not recognize the *casus foederis* of the Triple Alliance as applicable to such a case;<sup>2</sup> and the combined pressure of Rome and Berlin, coupled with the certainty of Russian aid to Serbia, again averted war at the last moment.

The Treaty of Bucharest, signed on Aug. 10, gave to Rumania the Turcutia-Balčik line, deprived Bulgaria of almost all her conquests in Macedonia and left her to settle the fate of Thrace as best she could with Turkey. Serbia acquired all Macedonia to the W. of the Vardar, and to the E. the districts of Štip (Istib or Shtip) and Kočana; but at the last moment Bulgaria was left in possession of a dangerous salient at Strumnica (Strumitsa), which enabled her to threaten Serbia's only railway connexion with the Aegean. The new Serbo-Greek frontier had already been fixed by mutual agreement, and ran from Gjevgeji (Gyevgyeli or Gevgeli) (30 m. N. of Salonika) to the S.E. corner of the Lake of Ohrida, leaving Florina and most of the Monastir-Salonika railway to the Greeks. The Treaty of Constantinople, which was concluded between Bulgaria and Turkey on Sept. 29 and deprived the former of the greater part of Thrace, did not directly concern Serbia; but the indifference shown by her and her new allies, and still more by Britain and Russia, to Turkey's violation of a treaty which was their joint work and indeed was morally binding upon them, was to be dearly paid for by Bulgaria's attitude in the World War.

The treaties marked a new orientation in the Near East. Slav coöperation was replaced by mutual hatred, which promptly threw defeated Bulgaria into the arms of Turkey and predisposed both for an alliance with Berlin; Rumania's ties with the Triple Alliance were sensibly loosened, while Greece was drawn in two directions by dynastic attractions and party rancours. The military balance had undoubtedly been altered to the disadvantage of the Triple Alliance, yet it was to William II. that King Charles addressed a cordial telegram on the conclusion of peace, "which thanks to you remains definitive," and it was to the joint efforts of France and Germany that Greece owed Kavalla.

*The Albanian Conflict.*—Austria-Hungary now concentrated her attention upon Albania, and thereby rendered still more acute the relations between Serbs and Albanians. In the past three decades the latter had been rapidly ousting the former from the historic territories of Kosovo, Prizren and Decani (Dečani), and now tried to justify present possession by a claim as autochthonous owners of the soil. The mountainous and inaccessible character of these borderlands and the extreme backwardness of their population made a guerrilla warfare almost inevitable; and the summons addressed to Belgrade by the Great Powers for the withdrawal of the Serbian troops (Aug. 19) was a signal for further trouble. Late in Sept. there was a formidable Albanian rising, and the insurgents, aided by numerous bands from beyond the frontier and armed with foreign rifles, seized Dibra and even Ohrida, and forced Serbia to remobilize the Morava division and many of her reserves. In order to prevent fresh raids, the Serbs occupied certain strategic points in Albania, and this gave Austria-Hungary excuse for a sharp warning. Thus for the first fortnight of October there was once more acute friction between Vienna and Belgrade. At last Serbia accepted the inevitable and with-

<sup>2</sup> The essential facts were first revealed by Signor Giolitti in the Italian Parliament in Dec. 1914.

drew her troops, but covered her retreat by a note to the Great Powers, begging them to enjoin upon their Albanian protégés a respect for the frontiers created for their benefit (1804). Even after this crisis was over, Count Berchtold made further trouble for Serbia by steadily opposing her Government's very natural desire to take over, so far as Serbian territory was concerned, the shares of the Orient railway hitherto owned by Austrian subjects. Vienna's permanent ill-will was further revealed by attempts to block the conclusion of a concordat between Serbia and the Vatican.<sup>1</sup>

By Christmas 1913 the situation in Old Serbia<sup>2</sup> was rapidly becoming normal, but the administration in the new territory left much to be desired, and the closing of Bulgarian schools, the expulsion of Exarchist clergy and occasional excesses against the Moslem population caused serious unrest and discontent. The Pašić administration became absorbed in defending itself against the increasingly violent onslaughts of the Opposition. In Dec. 1913 and again on June 2 1914 it resigned, but eventually remained in office. On March 4 the Opposition had withdrawn from the Chamber as a protest against alleged unconstitutional action of the Government in budget matters. But though the tension was increased by the activities of a powerful military clique known as "The Black Hand" and by the sudden and arbitrary seizure of its club premises by the masterful Minister of the Interior, Protic, the Government was still in office in the summer. The visit of Crown Prince Alexander and Pašić to St. Petersburg early in February had given rise to rumours of a new Balkan League under Russian auspices; but the advent of Radoslavov to power in Sofia had really made any such plan impracticable, and King Charles of Rumania, though bent upon coöperation with Serbia and receiving the Tsar with special honours at Constanta (Constanza), had no idea of breaking his connexion with the Triple Alliance.

*The Assassination of the Archduke.*—On June 24 King Peter, incapacitated by ill-health, appointed Prince Alexander as Regent, and simultaneously dissolved Parliament, Pašić having in April pledged himself to the election as for a "Great Skupština" for constitutional changes. Only four days later the assassination of the Archduke Francis Ferdinand and his wife at Sarajevo revived the latent Austro-Serbian conflict in a more acute form than ever. The authors of the crime, Princip and Čabrinović, belonged to a group of Bosnian Serb students, mostly under the age of 20, who gave terrorist expression to the universal discontent aroused by Austro-Hungarian repression throughout her Yugoslav provinces. The victories of Serbia during the Balkan Wars and the openly hostile policy pursued towards her by Vienna and Budapest had assured to her in the eyes of public opinion the position of the Yugoslav Piedmont. Thus no external incentive to the crime was needed; and the young hotheads were further swayed by sentimental considerations. The motive of the Archduke's visit was to conduct manoeuvres which had no meaning save as a rehearsal for a future campaign against Serbia: while the selection of "Vidovdan" (St. Vitus's Day—the anniversary of Kosovo) for his public reception in Sarajevo was regarded as a deliberate challenge to the Serb idea. It was, however, proved that the assassins had been in Belgrade and had been secretly smuggled across the Drina into Bosnia, after receiving hand grenades and revolvers from the Serbian Komitajis Major Tankosić and Čiganović. On these facts the Ballplatz sought to establish the complicity of the Serbian Government, but for this no evidence has ever been produced. Indeed presumption overwhelmingly favours the opposite theory. The country was exhausted by two wars; the Albanian campaign in the previous autumn had shown the reluctance of the peasant soldiers to return to the colours, and it was now the eve of harvest. Military stocks were alarmingly

low, as the next winter was to show. The young Prince had only just assumed the reins of Government; the position of the Cabinet was shaky, and a fierce electoral campaign was opening. The Concordat with the Vatican had only just been signed, and delicate negotiations with Montenegro for a customs and military union and perhaps even a dynastic arrangement, were still pending. Serbia had every conceivable motive for avoiding aggressive action. After the tragedy, it is difficult to see what other course her Government could have pursued; its one omission was to offer a thorough inquiry, without waiting for any suggestion from Vienna. The situation was from the first envenomed by the press of Belgrade, Vienna and Budapest; but it is to be noted that while the former had always had an irresponsible and highly scurrilous section, which the Government was unable to restrain owing to the lack of any proper press or libel laws, the two latter had always been extremely sensitive to the directive of the Ballplatz, and the worst offences were committed by journals with the strongest official ties.

*Austria-Hungary and Serbia.*—The ominous silence preserved by Austria-Hungary for nearly three weeks after the murder has been very largely explained by the documents published since the war by the Austrian and German republican Governments. From memoranda on Balkan policy prepared for Count Berchtold during May 1914, and re-drafted by him personally both before and after the murder, it is evident that Austria-Hungary was pressing upon Germany the need for clearing up the situation with Rumania, and for attaching Bulgaria to the Triple Alliance, and that Germany wished to use Bucharest as a bridge between Vienna and Belgrade, but dropped this idea after the tragedy. On July 2 Francis Joseph wrote to William II. that the main basis of Austro-Hungarian policy must be the isolation of Serbia, and "her elimination as a political factor in the Balkans," again advocated alliance with Bulgaria and proposed that Rumania should be warned that the friends of Serbia cannot be the friends of Austria-Hungary and Germany.<sup>3</sup> On reading the letter the Emperor William said that he must be prepared for European complications and must therefore talk with his Chancellor; but he at once authorized Count Szögyény to inform Francis Joseph that he might reckon upon Germany's full support "even in this case," and he urged that if there was to be an advance into Serbia, it should be at once, especially as Russia was certain to be hostile, though unprepared for war (July 5).<sup>4</sup> Next day Herr von Bethmann Hollweg instructed the German minister in Sofia to coöperate with his Austro-Hungarian colleague in favour of the Bulgarian alliance, and the German minister in Bucharest to announce Germany's abandonment of all idea of agreement with Serbia. That Germany gave *carte blanche* to Austria-Hungary has been vehemently denied by Bethmann Hollweg in his *Memoirs*, but is admitted in so many words in the preface to the official German White Book,<sup>5</sup> and is proved by Herr von Tschirschky's assurances to Francis Joseph on July 2, by the instructions which he received from William II. and Bethmann Hollweg, and by William's letter of July 14 to Francis Joseph.<sup>6</sup> As early as July 8, Tschirschky reported to Berlin Berchtold's intention of drafting an ultimatum in such a form that "its acceptance seems out of the question,"<sup>7</sup> and not merely is there no trace of Berlin rebuking this tendency, but there are repeated signs of impatience in Berlin at Vienna's delays. Not merely was the full initiative left to Vienna,<sup>8</sup> but on July 12 there was a joint decision between Vienna and Berlin not to inform Italy of their intentions, but to place her before "an irretrievable situation."<sup>9</sup> In Vienna the only counsels of moderation came from the Hungarian premier, Count Tisza, who at the Crown

<sup>1</sup> This statesmanlike measure was negotiated by Vesnic, the Serbian minister in Paris, and Gavrilovic (afterwards Yugoslav minister in London), aided by Bakutic, a Croat expert in canon law, from Sebenico.

<sup>2</sup> Since 1912 this name was transferred to the original kingdom and the "Old Serbia" of Turkish times became "New Serbia."

Council of July 7 opposed Count Berchtold and declined to admit war to be inevitable. He deprecated a surprise attack, without previous diplomatic action, as likely to place Austria-Hungary in a bad light before Europe and rally the Balkan States against her; he favoured harsh, but not impossible (*unerfüllbar*) demands upon Serbia, and even if their refusal should lead to war, he would not favour Serbia's complete annihilation, partly because Russia would then be forced to intervene, and partly because as Hungarian premier he could not sanction annexations at Serbia's expense. (Here he was following the traditional Hungarian view that the inclusion of further Slavs in the Dual Monarchy was a menace to Magyar supremacy in Hungary.) All the other ministers present—viz. the three joint ministers, Berchtold, Bilinski, and Krobatin, the Austrian premier Count Stürgkh and the chief-of-staff Baron Conrad—were agreed that a mere diplomatic success, even if it led to the public humiliation of Serbia, would be worthless, and that demands must be addressed to her such as would render rejection, and consequent military action, probable. By threatening to resign, Count Tisza carried his point that there should be no mobilization until the ultimatum had been rejected.<sup>1</sup> His attitude is clearly revealed by two memoranda which he addressed to Francis Joseph on July 1 and 8. In the first he condemns Berchtold's idea of using Sarajevo as an excuse for the final reckoning with Serbia as "a fatal blunder," but begs Francis Joseph to make every effort to overcome William's "prejudice in favour of Serbia." From the second it transpires that it was "the satisfactory assurances" of Berlin which had decided all Tisza's colleagues in favour of war with Serbia. He himself dissents, and insists that Serbia must be given a chance of escape, though only through severe diplomatic defeat. This is necessary in order to avoid complications with Italy, to ensure Britain's sympathy and to enable Russia to remain inactive.<sup>2</sup> On July 14, however, after full discussion with Berchtold, Tisza called upon Tschirschky and announced that "he had abandoned his original doubts and is quite in accord with energetic action,"<sup>3</sup> and that "the note will be so drafted that its acceptance may be virtually ruled out."<sup>4</sup> Berchtold on his side informed Tschirschky that Tisza had not merely come round to his view, but had "in certain points introduced a stiffening." On July 15, in answering an interpellation, Tisza denied that war was inevitable, but significantly added that a State which does not regard war as *ultima ratio* cannot maintain itself as a State. Thus while Tisza must be credited with statesmanship such as was signally lacking in his colleagues, his final decision and his subsequent zeal in the conduct of war make it impossible to claim him or his Government as unwilling actors in the great struggle, just as it is beyond dispute that the Magyar policy towards Croatia and the nationalities was a foremost factor in provoking the Austro-Serbian conflict which actually fired that train.

*The Ultimatum to Serbia.*—A further proof of Germany's failure to exercise a restraining influence on her ally is afforded by the detailed note presented on July 20 by the Serbian chargé d'affaires in Berlin to Herr von Jagow, expressing the strongest detestation of the murder, the desire for friendly relations with Austria-Hungary and a readiness to meet all such demands as might be compatible with State independence.<sup>5</sup> Jagow, however, deliberately refrained from taking up the note's concluding appeal for friendly intervention in Vienna, and there is no evidence to show that he even reported to Count Berchtold the Serbian appeal, while on the contrary he ignored King Charles's offer of mediation on July 10. The secret of the ultimatum was jealously guarded, and the long delay, created, as was intended, a false sense of security in some quarters. Its delivery at Belgrade, which took place at 6 p.m. on July 23, was carefully timed for the moment after President Poincaré's departure from St. Petersburg after his State visit, the object

being to eliminate the chances of French mediation. The ultimatum, after reminding the Serbian Government of its formal undertakings of March 31 1909, charged it with "culpable tolerance" of terrorist propaganda directed against Austria-Hungary and blamed Serbian officers and functionaries with planning the Sarajevo murders. It therefore demanded that the "Narodna Odbrana" (League of National Defence) and any similar society guilty of anti-Austrian propaganda should be dissolved, that objectionable passages should be expunged from Serbian educational works, that all officers or officials whom Austria-Hungary might name as guilty of propaganda should be dismissed, and that the Belgrade Government should not merely arrest certain specified persons charged with complicity, but should order the trial of others, allow Austro-Hungarian delegates to take part in the inquiry and accept the collaboration of Austro-Hungarian officials "in the suppression of the subversive movement."

The general impression produced by this document upon European opinion is best summarized in the words of Sir E. Grey, who telegraphed the next day to Sir M. de Bunsen, that he "had never before seen one State address to another independent State a document of so formidable a character." The fifth demand in particular (that of collaboration), he pointed out, "would be hardly consistent with the maintenance of Serbia's independent sovereignty."<sup>6</sup> None the less, Serbia in her reply actually consented to "such collaboration as agrees with the principle of international law, with criminal procedure and with good neighbourly relations." Only on one point did she reply in the negative; the share of Austro-Hungarian officials in the actual inquiry would, it was argued, be a violation of the constitution and the criminal code, but even this could be met by "communications in concrete cases." On all other points there was unqualified submission, and in certain respects, such as the offer to introduce legislation for fuller control of the press and to stiffen frontier regulations regarding weapons, the answer went much further than had been demanded. As a final proof of sincerity, Serbia offered to submit any outstanding points to the decision of the Hague Tribunal or even to the Great Powers which had imposed upon her the declaration of March 31 1909.<sup>7</sup> Thus Serbia is found for the third time in six years offering to submit herself to the verdict of the Hague—the two previous occasions being the Bosnian crisis and the Friedjung trial—and each time it is Austria-Hungary who rejects the proposal. Three days later, as a last resort, the Serbian Government informed the Italian Foreign Minister that it was even prepared to swallow the whole note, "if only some explanation were given regarding the mode in which Austrian agents would require to intervene," and went so far as to offer to accept these explanations from a third party, if Austria-Hungary was not disposed to give them to Serbia direct.<sup>8</sup>

Austria-Hungary had demanded an answer to her note by 6 p.m. on July 25, thus leaving a period of 48 hours for either reply or mediation. The official documents published in Berlin and Vienna since the war make it abundantly clear that the Ballplatz deliberately couched the note in such terms as to be unacceptable; but even in 1914 this was obvious from its tenor and from the significant fact that Baron Giesl, who received the Serbian answer from Pašić a quarter of an hour before the expiry of the time limit, instantly handed him a fresh note announcing the rupture of diplomatic relations and the immediate departure of himself and his staff. Moreover the text of the answer was kept secret in Vienna for several days, until a sarcastic commentary could be added; and Belgrade, presumably owing to the confusion which prevailed there, appears to have taken no steps to bring it promptly to the notice of the other Powers.<sup>9</sup> This is the more regrettable, since even William II. (to judge from his marginal notes on

diplomatic documents, as published since the Revolution) was impressed by the moderation of the Serbs, regarded Vienna's essential wishes as fulfilled and expressed the view that Giesl ought to have remained in Belgrade. His ministers, however, had failed to support Sir E. Grey's proposal for a prolongation of the time limit, and were thus responsible for bringing Russia into action. On July 27 the Tsar replied to a despairing appeal of the Prince Regent for assistance to Serbia, by a telegram strongly urging him to "neglect no step which might lead to a settlement," but conveying the assurance that "Russia will in no case disinterest herself in the fate of Serbia."<sup>1</sup> On July 28 Austria-Hungary formally declared war upon Serbia, and on the same day rejected the Russian proposal for a friendly exchange of views between Vienna and St. Petersburg.<sup>2</sup>

Henceforward the Austro-Serbian quarrel is merged in the larger diplomatic conflict between Alliance and Entente. Due stress ought, however, to be laid upon one of Sir Edward Grey's many efforts to avert war even at the last moment. On July 29 he received Count Mensdorff's assurance that Austria-Hungary "had no idea of territorial aggrandisement," and when he hinted that there were other means of turning Serbia "into a sort of vassal state," received the rejoinder "that before the Balkan War Serbia had always been regarded as being in the Austrian sphere of influence."<sup>3</sup> Undeterred by this ominous attitude, Sir Edward on July 30 put forward the proposal that Austria-Hungary, after occupying Belgrade, should cease her advance and consent to discussions with Russia, who otherwise could not be expected to "suspend military preparations."<sup>4</sup> In other words, Belgrade would become a kind of pledge in Vienna's hands for the attainment of a satisfactory settlement. The elaborate dispute regarding the Russian and German mobilizations has hitherto obscured the essential fact that on July 31 Francis Joseph definitely, almost petulantly, refused the British proposal as transmitted through Berlin,<sup>5</sup> thereby rendering the military action of St. Petersburg inevitable.

*The Outbreak of War.*—When Baron Giesl presented the ultimatum, Pašić had been absent electioneering in the provinces; but he at once returned to Belgrade, and on July 25 mobilization was ordered, and the seat of Government and the archives were hastily transferred to Nish. In view of so grave a crisis elections became impossible, and as parliamentary sanction was more than ever necessary, the Government had no other course than to ignore the fact of dissolution and to call the previous Skupština once more into existence. At its first meeting in Nish on Aug. 1, the entire Opposition endorsed the Government's action, and for the moment party life was in abeyance. Parliament also ratified the Concordat with the Vatican and a law ensuring to Catholicism full freedom of worship in Serbia. There was an unexpected delay in the invasion of Serbia, and it was not till Aug. 12 that the first Austro-Hungarian troops crossed the Drina and the Save. After 12 days of desperate fighting (known as the battle of the Jader) the invaders were thrown back across the frontier, this being the first definite Allied victory. Unduly elated by this success and by the news of Russia's rapid advance in Galicia, the Serbs were now led to underestimate Austria-Hungary's resources, and encouraged by the Allies, passed to the offensive early in September. Their rash invasion of Symria—a necessary preliminary to any successful penetration of Bosnia from the east—soon proved beyond their strength and had to be abandoned by Sept. 13; and the joyous welcome everywhere accorded to them by the population merely brought down a cruel vengeance on its head when the Austro-Hungarian army returned. A further mistake was made in attempting to hold the rich but strategically indefensible Mačva (Machva) district, doubtless owing to the horrid excesses committed there by the enemy during their first inroad. None the less the Serbs were able to check a second Austrian advance across

the Drina in mid-September. But on Nov. 6 General Potiorek began a third invasion in great force, and during the next month steadily pressed back the Serbian forces into the heart of their country. The danger was aggravated by shortage of ammunition, and when at last the necessary supplies began to arrive, a large force of Bulgarians armed with machine-guns and acting with the connivance of Sofia, raided the Vardar railway from the Strumnica salient and destroyed an important bridge on the only line by which the new guns could be moved up to the front. The enforced evacuation of Belgrade on Nov. 29 revealed the extremity of the danger, and brought the latent political crisis to a head. On Dec. 5 the purely Radical Cabinet resigned and was succeeded on Dec. 13 by a Coalition Government, in which Pašić remained premier, but the leaders of all parties save the Liberals received portfolios. It was however in this blackest week that the Skupština unanimously endorsed the Government's declaration that its foremost war aim was "the liberation and union of all our Serb, Croat and Slovene brethren not yet set free." This was the first public step of Serbia in favour of Yugoslav unity.

*Serbia after the Austrian Rout.*—With the arrival of munitions from the West the army's flagging spirits revived, and the brilliant offensive initiated on Dec. 2 by Gen. Mišić and the 1st Army resulted, after a twelve days' battle along the whole front, in the complete rout of Potiorek. By Dec. 14 Serbian soil was for the third time entirely free from invaders, and an enormous booty was captured. But the enemy left deadly infection behind him, and by the early spring of 1915 exhausted Serbia was immobilized by a typhus epidemic which is estimated to have caused about 300,000 deaths among the civil population. A notable part in checking its ravages was played by Lady Paget as head of the Serbian Relief Fund units in Skopje, and by Col. Hunter and a R.A.M.C. detachment, who organized a scheme of disinfection on the whole Serbian railway system. The latter step appears to have been taken in view of the possibility of Allied troops being employed upon the Danube, an idea which receded from the general design, in proportion as the Austro-German recovery in Galicia became more marked. Serbia's negative role during 1915 was due not only to exhaustion but to considerations of high policy. The attitude of Bulgaria was from the first extremely equivocal, and Serbia, had she listened to certain ill-considered pleas for a fresh offensive into Hungary, would have been at any moment liable to an attack from the rear, unless she could rely upon Greece or the Allies to hold Bulgaria in check. Meanwhile the Entente was eagerly working for the intervention of Italy and of Bulgaria, neither of whom could receive adequate satisfaction save at the expense of Serbian aspirations. During the winter pressure was repeatedly brought to bear upon Nish to make territorial concessions to Bulgaria in Macedonia; but the one and only condition upon which Serbia could safely have considered this—namely, that the Allies should guarantee Yugoslav unity in the event of victory—was precluded by their parallel negotiations with Italy, whose official policy it was to prevent, not to further, Yugoslav unity, and to whom by the Treaty of London, concluded on April 26 1915, no less than 700,000 Yugoslavs were assigned. The fact that this treaty's concealment from Serbia was made an absolute condition by Rome, did not tend to diminish the reserve of the Nish Government, who almost immediately learned the essential facts through Mr. Supilo's discoveries in official circles at Petrograd. The Serbs, who were not formally recognized as Allies by the Western Powers, were more conscious than ever of the value to them of the Vardar valley, which would form part of any serious concessions to Bulgaria; and they were from the first sceptical as to the possibility of winning over Bulgaria, whom they believed to be tied to Vienna and Berlin by a secret compact. They were further handicapped by the attitude of Greece, who in the autumn of 1914 exercised her right of veto, under the Serbo-Greek Treaty, upon any cession of territory to Bulgaria and was prepared to demand Monastir as compensation. This attitude could not be ignored at a period when Greece was still ready to intervene on the side

of the Allies, and when even King Constantine had firmly rejected William II.'s suggestion that he should fall upon Serbia and tear up the Treaty of Bucharest. What changed the views of both Athens and Sofia was simply the unfavourable turn in the military fortunes of the Allies. As long as the Bulgarians thought that the Dardanelles would be forced, their help could probably have been secured in return for the promise of Macedonia and the guarantee of an Allied occupation: what was lacking was the corresponding pledge to Serbia. The conclusion of a Bulgarian loan in Berlin in Feb. was the first sign of a change, and after March neutrality was the best that the Allies could hope for from Bulgaria, though she showed great skill in furthering Bulgarophil illusions in the West. Thus the concrete proposals addressed to Sofia by the Entente on May 20, over Serbia's head, came two months too late. The Radoslavov Cabinet now played for time, and while asking on May 15 for further details, concluded parallel negotiations with Turkey regarding the Thracian railway. On July 18 the official *Narodni Prava* spoke of the impossibility of Bulgaria keeping out of the war, and public opinion freely discussed the rival alternatives. The final reply of the Entente (Aug. 3) offered Bulgaria the "whole uncontested zone" of the treaty of 1913, with immediate occupation as far as the Vardar; discussion even of Skopje and of the "contested zone" after peace; Seres at once and Kavalla in the future; and the Enos-Midia line in Thrace. The price was to be war upon Turkey, Greece at once protested, and the Emperor William urged his brother-in-law on no account to cede Kavalla. But the decisive factor was the fall of Warsaw on Aug. 8; not only public opinion, but the general staff now regarded Germany's triumph as inevitable. The Turco-Bulgarian agreement was initiated on the very day after the Allied note, and completed at the end of the month, and on Aug. 20 its negotiator, the Germanophil Žekov, replaced Fičeo as War Minister. Meanwhile the position of the Pašić Cabinet was extremely delicate. It loyally declined to discuss the indirect overtures made to it from Vienna, and stood officially for the programme of unity: but during the summer, yielding to pressure from the reactionaries in Petrograd, it showed a readiness to limit its claims to the territory generally regarded as purely Orthodox—viz. Banat, Syrmia, Bosnia-Herzegovina and South Dalmatia—and to leave the Catholic Croats and Slovenes to their fate. This scheme would have fitted in with Italian designs and with the Treaty of London, which envisaged three separate Slav States, an enlarged Serbia, an enlarged Montenegro and a reduced Croatia. Its weakness lay in the ignorance of its promoters; for even such a division would have left well over a million Catholics in "Orthodox" Serbia. Its failure, however, was above all due to the vigilance of Mr. Supilo and his colleagues of the Yugoslav committee.

*The Conquest of Serbia.*—In the late summer the Serbian Government was unduly optimistic as to Greek and Rumanian intervention, and its disbelief in a German invasion was encouraged by Allied military opinion. Only three weeks before Mackensen crossed the Danube, Lord Kitchener, in conversation with a Serbian representative, gave his opinion that any action from the north was mere bluff. Hence though the Skupština on Sept. 5 authorized the Government to make territorial concessions, Pašić adopted a waiting attitude. Bulgaria's mobilization, two days after the opening of the Austro-German bombardment along the river front, proved his calculations to have been correct. Yet even at this moment Allied opinion hoped that Bulgaria might enter on the Entente side, and therefore a veto was imposed upon the Serbian general staff's plan for an immediate attack upon Sofia before the Bulgarian army was ready (Sept. 27). Next day Sir Edward Grey in the House of Commons announced that in the event of Bulgaria's aggression "we are prepared to give to our friends in the Balkans all the support in our power, in the manner that would be most welcome to them, in concert with our Allies, without reserve and without qualification." Relying on the fulfilment of this pledge, the Serbs devoted their main effort to checking the Austro-German advance and remained on the defensive towards Bul-

garia. The danger was increased by King Constantine's repudiation of Greece's treaty obligations towards Serbia and the overthrow of Venizelos. That statesman, however, had enquired of the Allies as early as Sept. 23, whether, if Bulgaria declared war on Serbia, and if Greece asked Serbia to supply the 150,000 men stipulated by the Serbo-Greek Treaty for such a contingency, France and Britain would assume Serbia's obligation for her; and an affirmative answer was received within 48 hours. On Oct. 6, the rupture with Bulgaria was complete. The fatal delays in sending the promised troops, coupled with Allied insistence that the Serbs should hold back Mackensen to the last moment, belong to military history; but their results were eminently political. At the critical moment of the Bulgarian menace to the Nish-Salonika railway there were at Salonika not 150,000 Allied troops ready for action, but 35,000 French, and 13,000 British, the latter under strict injunctions from London not to cross the frontier into Serbia.<sup>1</sup> Nish was decorated to welcome Allies who never came. The whole Serbian plan of campaign collapsed, and the armies, losing control of the railway southwards, retired precipitately through the passes leading to the plain of Kosovo. General Sarraill, informed that he must not expect reinforcements, was forced to arrest his belated offensive northwards (Nov. 12) and soon to withdraw to the west of the Vardar. The Serbs were thus cut off from Allied help, lost Skopje and only just escaped envelopment by the converging Austro-German and Bulgarian armies. The final retreat of the Serbian army and Government took place in the dead of winter across the inhospitable snow mountains of Albania and Montenegro to Scutari, Medua and Durazzo, a smaller section escaping southwards from Prizren and augmenting the Serbian forces south of Monastir. Fortunately, the general exodus of the civilian population was checked before it had gone too far; but the retreat stands out as one of the great tragedies of the war, and the loss of life which it involved must have far exceeded 100,000 and is estimated at twice that number by very sober authorities.<sup>2</sup> After dreadful sufferings the fugitives were conveyed by Allied transports to Corfu, which for the remainder of the war became the seat of the Serbian Government and a base for the convalescence and reorganization of the army. Notable assistance was rendered by British voluntary units, and some idea of the generous response of the British public to Serbia's need may be gathered from the fact that the Serbian Relief Fund from first to last collected over £1,000,000 in money and material, and employed over 700 workers in Serbia, Albania, Corfu, Salonika, Corsica, Biserta and France, while the Scottish Women's Hospitals under Dr. Elsie Inglis performed notable services for the Serbs both on the Balkan and the Russian fronts. The deaths of Mrs. Deamer, Mrs. Harley (Lord French's sister), Mrs. Haverfield, Dr. Inglis herself and many others set a seal on the new-found friendship of the two nations.

Conquered Serbia was divided for administrative purposes between Austria-Hungary and Bulgaria, the latter holding the Timok, Nish, Skopje and Macedonia: all that remained to the Serbs was a fragment of territory south of Monastir. Bulgaria now threw off the mask and officially declared the Serbian State to have ceased to exist. It therefore enrolled all men of military age throughout the occupied territory and in Feb. 1917 extended this to include the whole male population. It refused to recognize the Serbian Red Cross and took possession of the Serbian Legation in Sofia. All "ownerless" land was confiscated, all Serbian schools, law courts, and inscriptions were Bulgarianized, libraries and collections were either destroyed or removed to Bulgaria, the Serbian clergy were evicted, and there were wholesale deportations. A formidable rising in the mountains behind Kušumlje (Kursumliye) was brutally repressed, with over 2,000 executions (March 1917). The war aims now repeatedly avowed by Sofia were the annexation not only of Macedonia, but of Kosovo and Prizren, and the whole upper Morava and Timok valleys: a common frontier with Hungary: the prevention

<sup>1</sup> See Gen. Sarraill, *Mon commandement en Orient*, p. 27.

<sup>2</sup> G. Djurić, in *Royal Statistical Journal*, May 1919.

of Yugoslav unity and of Russia's acquisition of Constantinople and (after Rumania's entry) the retention of the whole Dobruja. Dr. Radoslavov more than once proclaimed Bulgaria's resolve to keep all her conquests,<sup>1</sup> and his official organs declared that Serbia's reconstitution, "no matter under what form, would be a perpetual menace to Balkan peace" and will never be permitted.<sup>2</sup> Austria-Hungary showed much greater reserve, airing from time to time various alternative schemes for a vassal Southern Slav State under the Habsburgs, keeping Prince Mirkó of Montenegro as a possible candidate for its throne and employing agents in Switzerland to sow dissension among the exiles.

*The Serbs in Exile.*—Soon after the establishment of the Serbian Government at Corfu party rivalries began to revive. The deputies were scattered, living mostly on the Riviera, an independent press was impossible, and regular Allied subsidies made the Government virtually immune from serious democratic control. The supersession of the Voivode Putnik and almost all his staff caused great indignation, and though the whole Serbian Coalition must bear the responsibility, it was known to be the work of Pašić, and his masterful colleague in the Radical party, Protić, then still out of office. In Aug. 1916 an attempt is alleged to have been made upon the life of the Prince Regent at the front, and the Government, after vainly urging the Skupština to institute a new form of courts-martial, proceeded in the winter—while the joint advance under Sarraïl was crowned by the capture of Monastir from the Bulgarians—to order numerous arrests on a charge of conspiracy and murder. Among those implicated were the late governor of Macedonia, Gen. Popović, the ex-War Minister Gen. Bojanović, and several distinguished staff officers: many line officers known for their gallantry were placed on the retired list or confined to the island at Corfu.

The Conspiracy Trial which opened in Salonika in Jan. 1917 and was conducted behind the shelter of a strict military censorship, resulted in a death sentence upon nine Serbian officers, and notably of Col. Dimitrijević, the head of a secret society known as "Union or Death," or more colloquially the Black Hand, whose chief aim had been to fan nationalist sentiments in the army. There is no doubt that "Apis," as Dimitrijević was called throughout the Slavonic South, interfered unwarrantably in politics, and it is probable that he had his hand in the Sarajevo murder; but the lack of convincing evidence for the alleged conspiracy makes it probable that he was the victim of rival military and political cliques. Strong pressure of the Old Radical leaders forced the Prince Regent to sign three death warrants and to disregard appeals for mercy from the Western capitals. This trial revived all the old party dissensions: the reactionaries had triumphed on the very eve of the collapse of their chief support, the Tsarist Government. Pašić found himself between two fires—the need for a more democratic restatement of foreign policy, and the demand of the young Radical and Progressive parties for a revision of the Salonika trial. Refusal led to their withdrawal from the Cabinet, and its reconstruction on a purely Old Radical basis under Pašić and Protić. The last occasion when all parties coöperated was on July 20 1917, when the Declaration of Corfu, drawn up between Dr. Trumbić for the Yugoslav committee and Pašić for the Serbian Government, met with unanimous approval. Pašić, having strengthened his position abroad by a visit to Paris and London, declined to convoke Parliament for four months after the legal period had expired. At last, as the result of a direct appeal of its President to the Crown, it met in Corfu on Feb. 12 1918; and the Government resigned, but after weeks of fruitless negotiation for a coalition ministry, was allowed to resume office.<sup>3</sup> The Opposition, which numbered 60 as against 64 Old Radicals, still insisted on the revision of the trial and the transference of foreign affairs from Pašić to their own candidate Drašković; and in April, when the budget was introduced, they withdrew in a body from the Chamber, thus leaving the Government without the quorum of 84 required by the

Serbian Constitution. Serbian public opinion was too scattered and disorganized to be effective, and the Corfu Government tried to discredit its opponents' action before the uninformed West, as defeatist or even Austrophil. Thus throughout the spring and summer of 1918 there was acute and growing tension among the rival Serbian groups, and the real initiative in the Yugoslav question and in the political campaign against Austria-Hungary, had passed to Trumbić, Beneš, Lansing and the Allies and to the leaders of the movement inside the Dual Monarchy. Pašić had reverted to his Pan-Serb attitude, opposed inclusion of Dr. Trumbić in a Yugoslav and no longer purely Serb Cabinet, and steadily obstructed the Yugoslav committee's work. There was, moreover, a certain section in the army which aimed at Serbia's military occupation and annexation of Habsburg territory, rather than a free union on equal terms. Fortunately all such ideas were absent from the mind of Voivode Mišić, whose comprehension of the issues at stake was illustrated by his special encouragement of the Yugoslav volunteers and by his signal tact in dealing with the newly constituted Government in Zagreb. Events, moreover, favoured union on terms of full equality; for Austria-Hungary had ceased to exist and her authority had been shaken off by all her Yugoslav subjects long before the Serbian army in its northward advance had even reached Belgrade. Any slight possibilities of initial friction were averted by Italy's action in advancing beyond the Armistice line; the whole Croat and Slovene population thus clamoured for the arrival of the Serbian army and received it everywhere as their liberator from Habsburg rule and their champion in the complications which then seemed imminent. (For the completion of national unity, see YUGOSLAVIA.)

**SERBIAN CAMPAIGNS.**—Although the Balkan area developed into one of the side-shows of the World War, it was there that it started in 1914 with the ultimatum of Austria-Hungary to Serbia. The 1914 operations and the conquest of Serbia in 1915 are narrated in separate sections below. Under SALONIKA CAMPAIGNS an account is given separately of the Allied operations on the southern Serbian front, 1915-8.

#### I. OPERATIONS IN 1914

The Austro-Hungarian military problem in starting a campaign against Serbia was complicated by the prospect of a Russian intervention in Galicia. The alternatives were: to defeat Serbia completely before the Russian threat became deadly, or to stand on the defensive against Serbia till after a great battle had decided the issue in Galicia.

The strategic geography of Serbia was, in its broad lines, simple. On the N. side there is the formidable obstacle of the

<sup>1</sup> e.g. in *Vossische Zeitung*, Oct. 10 1916.

<sup>2</sup> e.g. *Narodni Prava*, May 19, *Kambana*, Oct. 9 1916.

Danube and Sava, on the W. the line of the Drina, a river not very broad, but rapid and difficult to bridge, these rivers forming the actual frontier.<sup>1</sup> Initially then the assailant must begin by forcing a river barrier, whatever the direction of his advance, and his power to do so depended: (a) on the communications on his own side of the river, which would enable him to collect the troops and material for forcing the passage; (b) on the barrier itself; and (c) on the defensive positions available for the Serbs inside the barrier. Taking all these factors together, an attack on the northern barrier offered the best chances of success. It was the course chosen by Prince Eugene in 1717 and by Mackensen in 1916, and it was that which the Serbs themselves regarded as most likely to be taken in August 1914. The reasons which led the Austrian commander to choose differently will be considered presently. More important than the choice of a point at which the barriers could most easily be forced was the choice of a direction for the subsequent advance. The objectives were plain enough, the defeat of the Serbian field army and the occupation of the most important part of the country. Without the attainment of these objectives, Austria could not pretend to have conquered, or even to have defeated, Serbia. Both, however, were attainable by an invasion of the Belgrade-Pozharevats-Kragujevats-Krushevsats region, conventionally called the Morava valley. This was the richest part of the country, and the centre of all its communications. Here and here only could the Serbian army be definitely brought to action under conditions in which the Austrian superiority of numbers would be effective.

This region could be approached from the N. (Belgrade or Danube-Pozharevats front), from the N.W. (Sava and Lower Drina front), from the W. (Middle Drina front) or from the S.W. (Upper Drina front).<sup>2</sup> The first named was the most direct route. For the forcing of the Danube<sup>3</sup> five railheads on the Hungarian side were available, for the prosecution of the advance the Orient railway (Belgrade-Constantinople) and various branches of it. The country was rich in local supplies, populous, and relatively well provided with roads, and the general trend of the natural features, governing that of the lines of communication, was from N. to S. On the other hand, the defender would of course be best prepared for attack on this front, and the Danube obstacle was here most difficult to overcome, in spite of the command of the water ensured by the Austrian monitors.<sup>4</sup> Next in importance were the lines of advance from the Sava and Lower Drina, and especially those from the Sava, since the Drina valley was totally destitute of railway approaches on the Hungarian side. In the angle of the Sava and Drina lies the fertile plain of the Machva; many favourable points exist on the Sava for the forcing of a crossing, and the town of Shabats in particular offers a choice of tolerable roads leading S. to the slopes of the Tser (Cer) range S.W. to Valjevo, and W. to Arangyelovats, the last-named route conducting an invader to either Palanka or Kragujevats in the Morava region. In conjunction with such an advance, an operation on the left, over the Lower Kolubara, supplied from the Sava, would lead to the rear of Belgrade, while on the other flank a successful operation by troops organized for mountain warfare by Valjevo over the Kolubara and Rudnik ranges to Gorni Milanovats and Chachak would threaten the rear of the whole Morava region. As a way of turning the great obstacle of the Danube front, the lines of advance grouped on the axis Shabats-Arangyelovats possessed tempting advantages. But, considered from the point of view of supply, the disadvantages were very serious. Not only was this the longest route

between the railheads of deployment and the final objective, but it was destitute of railways<sup>5</sup> E. of the Kolubara. West of that river, indeed, the line Valjevo-Arangyelovats-Palanka lay in the very axis of the march, and a branch-line connected this with Obrenovats on the Sava, where water-borne supplies could be unloaded. But the barrier of the Kolubara and the ridge behind it had to be mastered before this branch could be used, and it was certain that the Serbs could assemble in time to fight on the Kolubara line if not W. of it. That is, from deployment to the first great battle the campaign would have to be carried out with road transport, and in the case of the rightmost routes (axis Valjevo-Chachak) pack transport only.

From the Middle Drina (Lyesnitsa-Lyuboviya front) all routes converge on Valjevo, at the head of the Kolubara. Thence operations towards Arangyelovats, Gorni Milanovats and Chachak would take the course already discussed. But up to Valjevo operations would lie wholly in mountainous country<sup>6</sup> and would depend for supply almost entirely on pack transport from distant railheads—for in Bosnia the railways come to an end 25-27 m. W. of the Drina, and from that river to Valjevo is a further 32 miles. All arguments against the choice of the Shabats route therefore applied with far greater force to the Valjevo route. Farther S., in the region of Vishegrad, operations into Old Serbia by way of Uzhitse might gain a footing, or help a Valjevo force to gain a footing, at Chachak. But such operations would be mountain warfare pure and simple. Although in this part the railway runs right up to the frontier, no body of troops large enough to deal with the Serbian army could be collected and fed in the upper valley of the western Morava, either by way of Uzhitse or by way of Valjevo. As a threat to the flank and rear of a beaten Serbian army retreating up the Morava valley, such manœuvres might be effective; but to the beating of that army they could contribute practically nothing. Operations from Vishegrad into New Serbia would be too eccentric to have the slightest influence upon the conflict of armies in the Morava valley, and the same would apply to operations from Focha or from the Herzegovina against Montenegro, supposing that state to join Serbia in resisting the Austrian advance. Operations in this quarter would be scarcely more than guerrilla.

On a review of the conditions, then, the most logical plan of campaign from the Austrian point of view would be a frontal operation S. from the Danube front, coupled with an enveloping movement from the Sava (or Sava-Lower Drina) front directed on Arangyelovats, the latter either preceding the other by some days and seeking to surprise possession of the Kolubara ridge, or following it and directed to the flank and rear of an ascertained position of the enemy. Loosely connected with these main operations an advance from the Middle Drina or Vishegrad or both on Chachak and the western Morava had advantages for the exploitation of victory, but not for the winning of it. Such a plan was proposed before the war in the Austrian staff, and practically the same plan was assumed by the Serbians as the basis of their defensive deployment. Whether any or all of these operations could be carried through before the Russians intervened, or before their intervention became dangerous, would depend on available time. If no time at all were available, a pure defensive was the only course. If time for a thorough conquest, all the operations above mentioned with proper proportioning of strength would contribute something to a decisive success. In any intermediate conditions, one or more of the subsidiary operations would be omitted from the plan, and, especially, if a minimum time were available only the direct S. attack from the Danube front would be admissible, with or without a collateral attempt by light forces from Shabats or Obrenovats to seize the Kolubara ridge.

The calculation of this available time depended principally upon the arrangements made between the Austrian and the German staffs for initial operations in Poland, Galicia and E. Prussia. For this a plan had been drawn up by Conrad von Hötendorf and Moltke in consultation; and, on the basis of this plan,

<sup>6</sup> Even the Yadar valley road was in many places unsuitable for wheeled transport.

<sup>1</sup>In its upper course the Drina passes inside the Austrian frontier, and direct advance into Serbia is therefore possible from the region of Vishegrad. But this roadless, mountainous region is quite unfitted for the movements of large forces.

<sup>2</sup>Attack from the stretch of the Danube front lying in the mountains between Weisskirchen and the Iron Gates was regarded by both sides as outside the limits of probability.

<sup>3</sup>The lowest reaches of the Sava are usually considered as belonging to this front.

<sup>4</sup>Six in number, armed with 4.7-in. guns, and armoured.

<sup>5</sup>The small line connecting Shabats with Loznitsa was of no importance except in the case of stabilized trench warfare in the Machva.

the scheme of operations adopted against Serbia was apparently the full scheme outlined above; concentric advance from all the fronts in varying strengths and at various dates. Nearly half the army was placed in position for this advance, and the Austrian supreme headquarters intended to conduct the campaign itself. But at the last moment, it is asserted, the Germans, rightly or wrongly, changed their minds, the allies' scheme for Poland and Galicia fell to pieces, and, in trying to adapt their plans to the new conditions, the Austrians threw their S.E. forces into confusion before they had even deployed. The responsibility for a grave initial blunder, then, lies ultimately with Molke, if he failed to keep his promise, or with Conrad, if he interpreted a mere interchange of views as a binding engagement. In any case the effect was to withdraw the forces on the San-Danube front to another theatre amid the battle for the river crossings.

*The Yadar Campaign.*—The deployment, carried out according to the original scheme,<sup>1</sup> in spite of the fact that, at some date not yet known, it had been decided to make a radical alteration, was as follows:—

*II. Army.*—General of Cavalry Böhm-Ermolli on the Danube-Sava front from Weisskirchen to Mitrowitz (Mitrovica). Left to right—VII. Corps (34th and 17th Divs.); 7th Div.; IV. Corps (32nd and 31st Divs.); IX. Corps (29th Div. only); 10th Cavalry Division. In reserve 23rd Honved Division. Total: 131 battalions, 42 squadrons, 56 batteries.

*V. Army.*—General of Infantry Liborius von Frank. On the Lower Drina from mouth to Lyuboviya, and left to right—VIII. Corps (9th Div., 21st Landwehr Div. and combined brigade); XIII. Corps (36th Div., 42nd Honved Div., one brigade, one mountain brigade). Total: 70 battalions, 15 squadrons, 39 batteries.

*VI. Army.*—Feldzeugmeister Potiorek. Vishegrad-Focha region, left to right—XV. Corps (1st and 48th Div. staffs with 4 mountain brigades); XIV. Corps (18th Div. staff and 6 mountain brigades); in reserve 40th Honved Division. Detached, facing Montenegro, 47th Div. and 3rd Mountain Brigade. Total: 74 battalions, 5 squadrons, 40 batteries.

Each army had in addition one Landsturm brigade and the V. and II. one to three "march" (i.e., reinforcement) brigades.

Of these forces the II. Army was withdrawn on Aug. 14,<sup>2</sup> leaving the others in full battle on the Drina. That this battle was in being, however, was due not to Conrad, who—naturally, under the changed conditions—ordered the "Balkan Forces" to stand on the defensive, but to "Feldzeugmeister" Potiorek, commander-in-chief as well as commander of the VI. Army. This officer, high in favour at Court, had been for some years viceroy in Bosnia-Herzegovina, and regarded the problem from the standpoint of the Sarajevo residency rather than from that of a military headquarters faced with a military problem. He saw above everything else the possibility of the Serbians advancing over the Drina to excite insurrection among their brothers and cousins, although there was nothing in the layout of the Serbian deployment to suggest this, and he not only kept the centre of gravity of the forces on the Drina, but, on his own responsibility, launched a "preventive" offensive on this unfavourable front.

On the Serbian side, general mobilization had been ordered on July 25, months since the demobilization that marked the end of the Balkan Wars. Of a population of about 3,100,000 in Old Serbia and about 1,800,000 in New Serbia (where there had been no time to set up the administrative machinery of conscription), 489,500 men were mobilized at the outset and some 43,000 more between August and September.

On Aug. 5 1914 Montenegro declared war on Austria-Hungary. Her forces amounted to about 50,000 militia with very little artillery, and were of no direct assistance to Serbia. But they occupied the attention of three mountain brigades of the enemy's army and, what was perhaps more important, they added considerably to Potiorek's politico-military anxieties.

Strategically, there were three possible courses open to the Serbs: the defensive in their own country, the offensive W. into Bosnia, Herzegovina and Croatia, and the offensive N. into Hungary; but the first course was the only one practicable. An offen-

<sup>1</sup> The III. Corps (6th and 28th Divs., 22nd Landwehr Div.), however, which mobilized with the other seven corps, did not proceed to the Serbian front, but was dispatched to the Dniester at once.

<sup>2</sup> It arrived in Galicia too late for the crisis there.

sive into Bosnia, even with Montenegrin aid, could only have succeeded if the populations there had been ready to rise at the first signal, which they were not. Politically, it would have played into the hands of the enemy by showing the world that Austria's fear of Serbian ambitions had been justifiable. Militarily, an offensive over the Drina presented the same supply difficulties in either direction. An offensive into Hungary, whether to the right or left of the Danube, must begin with the forcing of the Danube or the Sava, and in view of the disproportion between the opposed forces had no chance of success unless the bulk of the Austro-Hungarian army were at the same time closely engaged in Galicia and Poland. In the initial stages of the operations at any rate, therefore, such a movement was out of the question.

The strategy adopted was, therefore, purely defensive, in spite of the offensive victories of 1912-3 and the mania for the offensive at all costs and in all conditions which then pervaded almost every army in Europe.

The order of battle was as follows, the Crown Prince Alexander being commander-in-chief, and Voivode R. Putnik chief-of-staff, with headquarters at Kragujevats:—

*I. Army.*—General Boyovich. Divisions Timok I., Timok II., Morava II., Danube II., 52 battalions, 7 squadrons, 26 batteries: approximate strength 55,000, grouped about Palanka and Racha and Topola.

*II. Army.*—General Stepanovich. Divisions Shumaja I., Morava I., Danube I., and "Combined Division." 64 battalions, 10 squadrons, 33 batteries, about 71,000 men. Grouped about Arangelyevats, Lazarevats, Belgrade.

*III. Army.*—General Yurichich-Stürm. Divisions Drina I., Drina II., 28 battalions, 5 squadrons, 16 batteries, about 32,000. Grouped around Valjevo.

*Uzhitse Army.*—General Boyanovich. Division Shumaja II., Uzhitse Brigade, 24 battalions, 2 squadrons, 11 batteries, about 26,000. Grouped at Uzhitse and Bainashata.

*Independent Cavalry Division.*—Sixteen squadrons, one battery, about 3,000 concentrated at Ub.

*Belgrade Group.*—About 9 battalions, 2 squadrons, 10 batteries.

*Obrenovats Group.*—About 11 battalions, 5½ batteries.

*Other frontier troops,* in all about 25 battalions, 13 batteries.

In infantry, therefore, the Serbians had about 213 battalions to pit against the 272 of the enemy's II., V. and VI. Armies. On the other hand, nine out of ten of the men in these 213 battalions had fought in the wars of 1912-3. In artillery the opposed forces were nearly equal, about 110 Serbian to about 130 Austro-Hungarian; three-quarters of the Serbian guns were of a better model than the Austrian, and some heavy artillery was available. On the other hand, the equipment of the Austrians and their resources in ammunition and stores were much superior, for Serbia was nearly isolated, the one available arsenal was small, and stocks depleted in the Balkan Wars had not been made good.

In sum, then, it would appear that the Austrian expeditionary force—even counting the II. Army which appeared only to be withdrawn, and the III. Corps which did not appear at all—was none too strong for the defeat of the Serbian field army, let alone its destruction. And as soon as it had been decided to withdraw the II. Army, replacing it by a mere screen along the Danube, it was or should have been obvious that the 141 battalions, 17 squadrons and 70 batteries of the V. and VI. Armies were far too weak a force to attempt an offensive into difficult country held by superior numbers of well-trained and war-experienced troops. Potiorek, however, decided otherwise.

From July 26 to August 11 only minor incidents took place—bombardments of Belgrade and other places by the monitors, raids over the river for reconnaissance purposes. Then, on the night of August 11-12, the Austrian main bodies began to cross on a wide front at Drenovats (near Shabats) on the Sava, several points between Lyeshnitsa and Loznitsa on the Lower Drina, and Zvornik and Lyuboviya on the Middle Drina. On the 12th the frontier troops of the Drina defence were pushed back concentrically in the general direction of Valjevo, those of the Sava defence driven out of Shabats. E. of that point the II. Army, under orders for Galicia, remained inactive except for the seizure of Gipsy Island (Ostrovo Tsganlyia) close above Belgrade, while in and S. of the Vishegrad region the XV. and XVI. Austrian

corps were preoccupied by the activity of the Uzhitse army,<sup>1</sup> and the Montenegrins.<sup>2</sup>

During the 12th and following days the Serbian headquarters became convinced that nothing was likely to come from the Danube front, and shifted the centre of gravity of their forces towards the Upper Kolubara. The cavalry division at Ub was ordered to reconnoitre towards Shabats and to separate the Shabats column of the enemy from the Drina columns. The II. Army was to push the right wing (Shumaja I.) against Shabats, and its centre and left along the Tser and Iverak ridges and the Yadar valley in conjunction with the III. Army, which concentrated forward from Valyevo to Zavlaka and Krupany to support its retiring outposts. The I. Army was to take over the whole northern front as far as Obrenovats. The Danube 1st Div. was transferred to it, the II. Army receiving Timok I. in exchange.<sup>3</sup> These movements, in spite of forced marching, took time, and but for the difficulties which at once arose in the Austrian army—the V. Army had only wheeled transport—so forward a concentration would have been impossible. As it was, the dispositions were practically realized by the night of Aug. 15–16, when the battle proper opened with the Austrians on the front Shabats–Slepcevisch (elements of IV. Corps, and 29th Div., X. Corps, both of II. Army); Bela Reka–Tser plateau and Lyeshnitsa valley (VIII. Corps); Iverak ridge and Yadar valley W. of Yarebitse (36th Div., XIII. Corps); W. of Krupany and N.E. of Lyuboviya (remainder of XIII. Corps).

During the night and the day following there was heavy fighting on this line. The Serbian cavalry division, supported by Shumaja I. of the II. Army, pushed up to and towards the left of the positions of the Austrians about Shabats. The II. Army arrived in sufficient strength to hold a line on Tser, in the Lyeshnitsa valley, and on Iverak, in touch with the right of the III. Army W. of Yarebitse. But the centre and especially the left of that army retired under severe pressure from the Austrians (right of XIII. Corps) who, in this case equipped for mountain warfare, were able to capture Krupany and enforce the swinging-back of the whole Serbian left wing. Yarebitse was given up and, pivoting on the right of the II. Army, the remainder of that army and the III. took up new positions in an arc about Zavlaka (night of 16–17th).

On the 17th the Serbian cavalry spread over the Machva, intercepting communications between the Austrian Shabats force and the columns working along Tser plateau.<sup>4</sup> But Shu-

<sup>1</sup> On Aug. 2–4, Serbian forces captured Uvats, Rudo and Ustivar, and raided the Drina immediately below Vishegrad. Other raids were pushed, with Montenegrin co-operation, over the Metalka Saddle on Chaynicha (Cajnice), and towards Focha. On the 7th an Austrian advance from Vishegrad on Gradishte was checked by the Serbians. On the 16th a Serbian attempt to capture Vishegrad by forces from Uvats, Gradishte and the hills to the N.E. was repulsed. The Austrian XV. and XVI. Corps at the same time took the offensive on the front Vishegrad–Chaynichia. While the left flank was being cleared by sharp mountain fighting (19th) about Chelebish (S.E. of Focha), the Chaynichia force crossed the Metalka Saddle and moved on Plevlye, Priyepolye, while the Rudo troops on the left forced the Serbian positions on the Lim at Uvats and Priboj (20th–22nd) and the Vishegrad troops repulsed a second attack on their stronghold (20th–21st). But at this moment the collapse of the main offensive on the Drina compelled the Austrians to retreat to Vishegrad and Focha, whither they were followed by the Uzhitse army and the Montenegrin Plevlye group.

<sup>2</sup> On Aug. 7–11 Montenegrin forces raided Artovatz on the Gatsko road and Klobuchi on the Trbinye road. Cattaro was intermittently bombarded, and Budua raided, from Mount Lovchen. These raids were repelled by the Austrian 3rd Mountain Brigade and 47th Division. But on Aug. 15 the main body of the Montenegrins appeared before Bilek (Bileva) which they blockaded for some time. On the 25th–26th, however, a northward sortie of the garrison, coupled with a southward advance of the 3rd Mountain Brigade from Gatsko, caused the Montenegrins to give up the blockade, and on Aug. 30–Sept. 2, forces from Trbinye co-operating, the 3rd Mountain Brigade and the Bilek force drove back the invaders into their own territory. A threat to the Montenegrin rear by part of the 3rd Mountain Brigade which advanced from Gatsko S.E. to Visznitsa Do largely contributed to the result.

<sup>3</sup> This distant division seems to have reached the front on the 18th.

<sup>4</sup> The Austro-Hungarian force at Shabats was limited to pure defence by orders of the army command which was preparing

major I., advancing from the S. on Shabats, was arrested by entrenched infantry some 3 m. short of its objective. The II. Army on Tser and Iverak and the right of the III. Army in the Yadar valley maintained an unbroken front, and on Tser in particular carried out counter-attacks, but the continued pressure from the S.W. on the centre and left of the III. Army compelled a further retreat. Here the situation was becoming critical, the Austrian 42nd Div. threatening to seize the Valyevo road to Osechina behind the Serbian positions, while farther to the S.E. only third-ban troops stood between the Austrian mountain brigades and the Petska–Valyevo road.<sup>5</sup>

On the 18th the fighting continued in front of Shabats, and Shumaja I. drew back to Slatina, while the cavalry division, meeting the Austrian 21st Landwehr Div. about Lipolist, fell back to concentrate in line between Shumaja I. and the Tser ridge. On Tser and Iverak the day was a repetition of the 17th, with more pronounced counter-attacks on the front of the defence. On the right of the II. Army the strong position of Kozaninrad on Tser was stormed and held, in spite of the fact that reserves had been given up to strengthen the III. Army. On the critical wing of that army also the day was rather more favourable,—thanks to the arrival of the II. Army reserves alluded to above, which by counter-attacks prevented an imminent breach in the centre of the III. Army, now E. of Zavlaka, in the Yadar valley. Farther to the S.W., little ground was gained by the Austrian mountain troops, the Serbians still holding Rozan and Proslap on night.

The 19th was destined to be the critical day. On the Serbian right, the Austrian Shabats force, now superior in numbers to Shumaja I., took the offensive and drove back the Serbs to the river Dobrava, while the 21st Landwehr Div. from Lipolist pressed back the cavalry division a short distance. On the left of the general front, the III. Army and the left of the II. lost ground, both in the Yadar valley and on the extreme left where Rozan and Proslap and even Petska fell into the enemy's hands.

But in the centre, on Tser and Iverak, a definite change in the situation set in. Freed by the capture of Kozaninrad on the previous day, the Serbian "Combined" division on Tser pushed ahead rapidly along the ridge, although with every advance it was more and more ahead of the troops on either flank. This success not only imposed caution on the assailants of the cavalry division on the Machva plain, but, what was of decisive importance, brought them into positions overlooking the Lyeshnitsa valley. Threatened in rear, and with their wheeled transport exposed to capture, the Austrians began to fall back not only in that valley but also on Iverak before Morava I., and General Stepanovich decided to ignore the grave position of affairs on his left and force victory in the Yadar valley. The "Combined" division and Morava I., therefore, always echeloned from right to left, drove along Tser and Iverak, Timok I. in the Yadar valley conforming. The battle of the Yadar was decided.

On the 20th the drive along the ridges was accentuated more and more, and the Austrians fought no longer for victory, but for escape. So vigorous was the pursuit on Tser that a part of the "Combined" division outran all support and barely escaped destruction in the rear of the enemy's lines. Both along Tser and along Iverak, artillery was, with great efforts, pushed up behind the advancing infantry to shell the valleys below. In the Yadar valley Yarebitse was captured by 10 A.M. and the general pursuit ended near the Drina the same evening. The right wing of the Austrians, less hard pressed and better organized for movement in rough country, retired in good order. Morava II., from Valyevo, only reached Krupany on the 21st. No attempt was made, however, by the Austrians either on the Lower or the

for the move to Galicia. After crossing on the 12th, it was actually withdrawn again on the 14th, leaving only outposts on the hostile bank. At Potiorek's request, however, the 29th Div. was again sent over the river on or about the 17th.

<sup>5</sup> So serious was the situation that already on the 16th G.H.Q. had ordered Morava II. of the I. Army, hitherto posted about Lazarevats to meet a possible attack by Obrenovats, to move by forced marches to a position astride the Petska–Valyevo road. The division reached this position on the 18th.

Middle Drina to keep a foothold on the right hand, and on the 22nd the whole river front was again occupied by the Serbians.

Meanwhile the troops of the Austrian II. Army had ceased to press Shumaja I. on the line of the Dobrava, and begun to fall back on Shabats, and the 21st Landwehr Div. in the plain likewise retreated on the Drina, followed by the Serbian cavalry division which gleaned prisoners, guns and vehicles. On Aug. 21-22, Shumaja I., reinforced by troops from Tser on its left, and also by Timok II. from the I. Army, advanced from the S.E., S., and S.W. on Shabats, held by elements of the IV. Corps and by the 29th Div., under the command of General Tertszyanski. On the 23rd sharp counter-strokes were made by the Austrians to hold off pressure on their river flank. Only rear-guards remained in Shabats when the Serbs attacked on the 24th.

So ended the first invasion of Serbia. The principal reason for its failure was the Austrian commander-in-chief's undervaluation of the military, and overvaluation of the political, factors with which he had to deal. Neither on the part of the Higher Command nor on the part of the Court was pressure brought to bear on him. Nor, after the event, did he attempt to find scapegoats among his subordinates. What he did, he did in the exercise of unfettered judgment. But history will not regard this judgment as of a high order. To hurry<sup>1</sup> on an offensive in mountainous country, from a starting-point at a maximum distance from the strategically decisive point, with three armies equipped in the main for warfare in the plains, of which one was under orders for another theatre, is so astonishing a proceeding that it can only be assumed that the campaign was never intended to be more than a demonstration of activity, analogous to a punitive march up some valley of the Indian frontier region. And indeed, Potiorek's position as civil and military commander of a rough frontier region has been very aptly compared to that of an Indian viceroy. Regarded from this standpoint, the advance over the Drina is an operation differing in degree only from the advance of the XV. and XVI. Corps on the Lim or that of the 3rd Mountain Brigade into the fastnesses S.E. of Gatsko. And in such an operation the assistance of the II. Army might no doubt be dispensed with. But if the ground of justification be thus shifted, the basis of criticism is shifted also, and in that case what is to be said of a modern European commander-in-chief who thought that an organized army of 11 strong divisions, recently victorious in two campaigns over other organized armies, could be treated as though it were on the military-technical level of a frontier tribe? Actually, it appears that the astonishment and dismay of the commanders, from army down to and below division commanders, at the incomprehensible sequence of events was no small factor in the issue.

Of the conduct of operations on the Serbian side it need only be said that Putnik's management of his forces in space and time, and the choice of the moment and place of counter-attack, were masterly. To gain great results, the risks of a forward concentration were accepted, but always under such conditions that the chances and profits of success were greater than the chances and losses of defeat. The object was limited, but its attainment complete without remainder.

At the same time, in this as in many other instances, the idea of a limitation of objective has been criticised *per se*. Only a detailed reconstruction of the conditions at the moment of the counter-offensive would make a final judgment to be formed on the question in the present case; and for that the materials not only have not been published but are probably not even in existence, since the bulk of the Serbian archives were destroyed in the autumn of 1915. But this much may be said, that the Serbians were, in point of ammunition and transport, ill-equipped for a great strategic pursuit either into Bosnia or into Hungary, that the great battle in Galicia was only just opening, and its consequences could scarcely be foreseen, and that the strain of the forced marches imposed by the forward concentration, followed by that of hill fighting, had told heavily on the victors.

*The Strymian Operation and the Massed Austro-Hungarian*

<sup>1</sup> The Commander of the V. Army, von Frank, protested against this hurry, and only submitted to a formal order.

*Attack.*—The Yadar and Shabats operations closed, then, on the river line, but meanwhile no events had taken place on the front E. of Obrenovats, and the Austro-Hungarians were palpably withdrawing forces by all railheads between Weisskirchen and Mitrovitsa, and after a short rest the Serbian command decided to push an offensive over the Sava into Symria (Srem), the sub-district of Hungary lying in the angle between the Sava and Danube. In this region were three of the six railheads at the enemy's disposal and an important lateral line. Its occupation would therefore thrust back the line of deployment of any future attack from the N., and the new front to be held defensively at the further limit of the occupied area would lie in and across the Fruska mountain range (the Mitrovitsa-Peterwardein), and thence along a part of the Danube which was exceptionally strong as an obstacle—owing to the marshes and channels at the confluence of the Theiss—to Semlin and the old Danube front. This gained, it would be possible to embark upon an invasion of Bosnia without fear of a sudden attack in flank and rear.

As early as the 26th, two days after the reconquest of Shabats, Putnik issued general instructions regrouping the army for the new project. The II. Army (now to consist of Morava I., Timok I., Timok II., and "Combined" divisions) was to occupy and defend the Lower Drina to Lyeshnitsa exclusive. The III. Army (Drina I., Drina II., Morava II.) was to hold from Lyeshnitsa inclusive to Zvornik. A special detachment, reporting directly to G.H.Q., was to hold the crossings below and at Lyuboviya. The I. Army (Shumaja I., Danube I., cavalry division) was to assemble towards Shabats and prepare to force a passage into Symria. The Belgrade and Pozharevats groups were to continue in their defensive missions, the former to be prepared to coöperate with the I. Army in the capture of Semlin, the latter to dispatch its principal formation, Danube II., to Obrenovats for Sept. 9. The Uzhitsa Army was to continue its mountain offensive towards Vishegrad, in concert with the Montenegrin Plevlye group. The date of the Sava crossing was to be ordered by G.H.Q., and meanwhile the II. and IV. Armies were instructed to reconnoitre crossing places on the Drina line, and to obtain all possible intelligence as to the condition of the enemy in their front.

A pause followed, while the preliminary work was being carried out and the I. Army being marched over from the Morava valley. The enemy was occupied with reorganization, and with the reliefs and takings-over consequent on the withdrawal of the II. Army. On the whole northern front there remained one post-line division only, the 29th; along the rivers themselves were Landsturm formations. Yet Potiorek was in fact contemplating a new thrust on the Drina; and the 29th Div. was ordered to be ready to coöperate by forcing a passage of the Sava at Yarak. Thus it befell that the division was grouped between Huma, Yarak and Nikinci when the Serbian offensive was launched. Apart from it, there were no formations in Symria other than the regiments holding the thin surveillance line.

On Sept. 3 General Krauss, commanding the 29th A.H. Div., received word that the Serbs intended to force the passage of the Sava below Mitrovitsa. This report he more than half-disbelieved, and in any case, regarding Mitrovitsa-Yarak as the centre of gravity of the Serbian offensive into Symria, he was content to leave his forces grouped as they were for Potiorek's intended advance. This was to take place on the 7th, and for it the 7th Inf. Div. was added to Krauss's command, henceforward known as the "Combined Corps Krauss."

On the night of Sept. 5-6, the Serbian preparations being complete, the passage was forced in two places, between Mitrovitsa and Yarak by Timok I. of the II. Army, and at the Kupinovo loop by the I. Army. The former, intended more as a demonstration than an operative crossing, was successfully achieved, but the eager troops pressed on without making a bridgehead, fell into the midst of Krauss's troops and, driven back on the river, were overwhelmed in the attempt to recross, five battalions being completely destroyed.

The Kupinovo division, on the other hand, secured their position with a bridgehead line before pushing on. Fortune favoured them, too, for the defence here consisted of Landsturm forces

directed by a headquarters at Peterwardein, and Krauss, bound to Yarak by his orders to coöperate in Potiorek's Drina offensive which had not been cancelled, only sent his newly arriving 7th Div., piecemeal, to assist the Landsturm in holding the Syrian plain. This was, of course, unknown to the Serbian I. Army, which developed its advance cautiously across the plain and by the night of the 8th occupied a front from Platichean near Klenak by Brestac round to Progar. In the next days, the left stood almost fast while the right pushed out, cleared a passage for the troops at Obrenovats, and by a threat to the rear of Semlin forced the enemy to give up that place to the Belgrade forces. Lastly, the right of the line swung up with its flank on the Danube and its centre on Gorubints; the intention was to bring this right wing by a wheel into the W. part of the Fruska range and so to make good the line across that range from river to river which was the objective, without losing men in a frontal battle against the enemy's strong forces about Huma and Mitrovitsa. For three more days it was persisted in, then on the evening of Sept. 11, owing to the situation of affairs on the Drina front, it was given up. On the 12th, 13th and 14th a methodical retreat, with which Krauss's 29th Div., though released at last from Mitrovitsa-Yarak, was unable to interfere seriously, brought the Serbian I. Army and Belgrade and Obrenovats forces back to their original positions whence the field divisions were hurried with all speed to take part in the new battle of the Drina.

Potiorek's second offensive had opened on the night of Sept. 7-8. The VIII. Corps (with which originally the 29th Div. was to have coöperated) bordered the Lower Drina as far up as Bielyina, the XIII. from that point to Kozluk, the XV. thence to Zvornik, and finally the major part of the XVI. corps opposite Lyuboviya, the remainder, as in the previous phase, facing the Uzhitse Army and the Montenegrins. The Serbs were, as the result of the Yadar operations and the proposed offensive into Bosnia, deployed in strength, and this, on the one hand, increased the probability of repulsing any given attempt, but on the other made it more difficult to deal with any break-through that might actually occur, as the defence system lacked depth.

The attack began with the VIII. Corps. Here it only succeeded in establishing a bridgehead in the N.W. corner of the Machva, covering temporary bridges at Parashnitsa; and the expected coöperative attempt of the 29th Div. at Yarak was not made, as, by the date fixed for this coöperation (the 9th), Krauss had concluded that the failure of the VIII. Corps was too clear, and the situation in Syria too critical to allow it.

But farther S., on the front of the XV. Austrian Corps and the right of the XIII., the Serbians' III. Army had more difficult conditions for defence, and on the night of Sept. 8-9 the passage was forced first at Brasinski Han and then at Zvornik. Crossings followed at other points farther up as far as Lyuboviya. The Serbs were forced back to the Gučevo-Boranya-Yagodnya ridge.

By the 11th the situation on this wing was serious enough for the Serbian command to order the cessation of the Syrian offensive and the transfer of the I. Army with all possible speed to the region of Valyevo-Petska.

Meanwhile, local reserves gathered from behind the centre had been dispatched to establish a front Yagodnya-Brankovac-Rozani-Proslav. Behind this line, the reassembly of the I. Army about Valyevo was to take place. Its headquarters were ordered to Valyevo, its forces to the same point as a preliminary to concentrating about Petska, whence the enemy was to be attacked in flank and rear towards Krupany, Zavlika or Osechitsa, according to the amplitude of his presumed sweep. The definite line of resistance on which battle was to be accepted if the Austrian pressure was maintained, was from the Dobrava S. of Shabats to Brestovats and Tser ridge (II. Army), thence in the hills about Zavlika or about Osechitsa (III. Army), according to circumstances, to whatever point on the Petska-Valyevo road the concentrating I. Army<sup>1</sup> was able to reach in time.

<sup>1</sup> To aid in this concentration, only the Danube I. Div. was to be disengaged at once in Syria, and the army was to be reconstituted by this division's picking up *en route* Danube II. from Obrenovats and a division of the II. Army from Tekerish. This latter did not join, becoming absorbed in the lower Yadar fighting.

Two days later the situation was suddenly modified again. On the night of 12-13th parts of the Austro-Hungarian XIII. Corps began to cross the Drina at Kuriachista, midway between Lye-shnitsa and Loznitsa, opposite the left of the II. Serbian Army, which was by now weakened through giving up local reserves and taking over an extended front for the benefit of the III. Army. This new move threatened not only to cut the Serbian line in two, but to roll up the whole Gučevo-Yagodnya position by a drive along the Yadar valley behind it.

With this, the battle becomes too tangled for brief description. Though the particular threat from Kuriachista was soon ended, the left of the Austro-Hungarian XV. Corps developed strong attacks on Loznitsa. The struggle for the W. end of Gučevo ridge and the lower part of the Yadar valley was fed from day to day by successive reinforcements arriving on each side. Here, minor contests for the possession of minor ground features, attempts to hold a hill long enough for it to be crossed with guns, or to storm it before it could be crowned, went on for days collaterally with the pressure exercised by the Austrian mountain troops of the XVI. Corps on the left of the Serbian III. Army, until the forces of the Serbian I. Army began to appear on Sept. 15. Next day, with a considerable force in hand, the I. Army staff mounted a counter-attack which bore back the Austrians from the line W. of Kostaynik-Sanats (pt. 835)-Sokoloka Planina-Petska, to one which on the evening of the 18th ran from W. of Kostaynik-Sanats-Veles-Karashitsa-Lyuboviya. Then, with further Serbian gains to the right of Sanats, fighting died away all along the line and trench warfare set in on the front from Karashitsa to Lyuboviya, the Austrians and Serbs facing one another on the line Gučevo-Boranya-Yagodnya-spur S. of Yagodnya.

On the Machva front, meanwhile, the offensive of the VIII. Corps, which had at first obtained only a bridgehead at Parashnitsa, was resumed in combination with a crossing at Yarak by Krauss's corps, when Syria had been evacuated by the Serbs. Here also, after violent but narrow-fronted attacks, trench warfare set in on the line of the two bridgeheads (N. of Shabats-Glushitsi, and Ravnje-Serbian Racha) which on Oct. 31 were united in one by a successful advance of the VIII. Corps from Ravnje to Glushitsi.

The second phase had been very different from the first. The Austrian staff had taken their opponent seriously, and laid their plans carefully, and it was only after the greatest exertions and very heavy losses that the Serbs had succeeded in pushing back the invaders. Even so, the latter had mastered the greatest part of the river obstacles, and in the absence of aircraft on the side of the defence, could carry on all preparations for a fresh offensive, unseen behind their firmly held trench-line.

Meanwhile, the Uzhitse Army and the Montenegrins, who at the close of the first phase were following up the retreating Austrians towards Vishegrad, had developed a series of operations which, like the expedition into Syria, were designed to prepare the way for a serious offensive of the II. and III. Armies over the Drina. This being forestalled by the Austrian offensive, the operations of the Uzhitse Army and its allies were without practical effect. They were, however, vigorously conducted.<sup>2</sup>

<sup>2</sup> On Sept. 4 Gole's Height, S.E. of Vishegrad, was stormed by Shumaja II., while farther up the Drina, other Serbian and Montenegrin forces attacked at Ustipratsa, Gorazda and Focha. At the latter place the Montenegrins broke through on Sept. 11, and a raid was pushed deep into the enemy's country, while a number of simultaneous attacks at Gorazda, Ustipratsa, Vishegrad and Bainabasha caused the Austrian 8th Mountain Brigade to draw back to Han Pesak and Srebenitsa, when it crossed the rear of its Corps (XVI.) fighting N. of Lyuboviya. This and the other Austrian mountain brigades, however, maintained an active war of raids and expeditions in the mountains. The Montenegrin main body, from Focha, moved E. to Kelinovik, which it captured and then evacuated. Other Montenegrins from Focha and Serbs from the Vishegrad and Rogatisa region threatened Sarajevo for some time, though periodically cleared away by expeditions of the mountain brigade from Sarajevo and the 8th Mountain Brigade from Srebenitsa and Han Pesak. Meanwhile, the bulk of the Serbian Uzhitse forces (Shumaja II.) advanced by Han Pesak on Vlasenitsa, and also to Srebenitsa. Indecisive fighting took place at the former during the last of September and the first of October, but at Srebenitsa the threat to the rear of the Austrian XVI. Corps was dissi-

*The Kolubara Campaign.*—The course of the war during September and October had not been favourable to Austria-Hungary. Galicia had been lost, and the line of battle had receded W. until it lay in the region of Lodz-Cracow—the Dunajec and the Carpathians. In November, the campaign in the western theatres had ended in deadlock. Falkenhayn had succeeded to the control of German operations, and his doctrine of wearing-down strategy was taking shape. Winter was at hand.

Nevertheless, Potiorek meant to resume active operations. No binding order prevented him from doing so. Conrad's instructions were that he was to prevent an irruption of the Serbs into Austro-Hungarian territory, but it was left to him to decide whether that defence should be passive or conducted offensively by partial attacks. The Emperor expressed the wish that Potiorek would succeed in defending the monarchy, to which the *Feldzeugmeister* replied that he "hoped to do a good deal better than that." Falkenhayn, with his wider outlook, suggested a sudden seizure of the N.E. corner of Serbia with the view of opening up a line of munitions transport to Turkey, but this project aroused no interest at the headquarters of the "viceroy" of Bosnia, who was resolved to drive another offensive into Serbia with all his might, at the first favourable opportunity.

The Serbians meanwhile had suffered severely from the unfamiliar conditions of trench warfare, notably in the Machva, and at the end of October Putnik had decided to evacuate the line in that quarter. The Austrian attack of Oct. 31, therefore, met with only outpost resistance, and Shabats was occupied two days later, while monitor activity continued on the rivers.<sup>1</sup>

The advance of Krauss and the VIII. Corps in the Machva was the first stage of the new general offensive. On the night of the 4-5th it was developed by a frontal attack from Shabats combined with a fresh crossing at Mishar, the Serbians continuing their retreat to the line N. Dobrava-Dobrits-Tser ridge. On the next night (Nov. 5-6) a heavy bombardment opened along the whole Austrian front, especially on that of the Guchevo range. On the 6th, infantry pressure began along the mountains from the W. end of Guchevo as far as Yagodnya. Once more, evidently, Potiorek intended the centre of gravity of his attack to be on the right and right centre, the front of his own army composed of mountain troops long familiar to him, and well equipped for the work. On the 6th, from the slopes of Guchevo itself he issued a proclamation, stirring his troops to the highest efforts by promising them this time the "annihilation" of the "exhausted" enemy. Nor were these empty words, for the condition of the Serbian *moral* at this time and their shortage of ammunition were evident.

At this opening moment, the dispositions and order of battle on both sides were as follows:—

*Serbian II. Army* (Vidoyevitsa-Dobrava): Morava I., Timok II., Shumaja I., Timok II., Cav. div. and details; 63 battalions, 27 squadrons, 34 batteries.

*III. Army* (Yadar-Kostaynik): Drina I., Drina II., Combined Division; 40 battalions, 6 squadrons, 18 batteries.

*I. Army*, under Boyovish (Kostaynik-Uzovitsa stream and Drina): Morava III., Danube I., Danube II. (temporarily de-

pated by a counter-attack of the 8th Mountain Brigade when that formation returned from an expedition in relief of Sarajevo. The Serbian column retreated whence it had come, to Bainabasha. Finally, when on the main front much warfare set in, the Serbians and Montenegrins began slowly to retire to their respective frontiers, while on the other side a systematic drive was carried out by large forces of the XV. and XVI. Corps. One Austrian group advanced from Sarajevo E. on Rogatitsa, and won a severe engagement on Romanja Planina on Oct. 21-22. While another following up the retirement of the Serbs from Vlasenitsa advanced on Rogatitsa from the N. The Montenegrins between Focha and Katinovik did not give way without inflicting severe losses on the group opposed to them. But by the end of October all the allied forces had withdrawn behind the Drina. Farther S., the region of Artovats was again the scene of some irregular fighting in October.

<sup>1</sup> During October, there had been many local engagements on the Danube-Sava front. Belgrade was frequently bombarded. The defence was very active, and minefields were placed at several points, to one of which, near Shabats, the monitor "Temes" fell victim on Oct. 23. In the main, however, the Austrians kept the upper hand.

tached to II. Army); Lyuboviya detachment; 44 battalions, 9 squadrons, 24½ batteries.

*Uzhitse Army*, under Aratic (along Upper Drina from Tiryeshtitsa stream to the Lim, front continued thence by Montenegri); Shumaja II., Lim detachments, Uzhitse Brigade; 34 battalions, 2 squadrons, 12 batteries.

*Belgrade Detachment*, under Zhivkovich (Brestovik-Pechani): 17 battalions, one squadron, 9 field and some medium batteries.

*Obrenovats Detachment* (Pechani-Vukodrazh R.): 6 battalions, 3 batteries.

*Braničev Group and Kraina Group* (Brestovik-Kladovo): 12 battalions, 4 batteries.

(The three last-mentioned forces were on the river front.)

Serbian total: 226 battalions of all categories, 41 squadrons, 113 batteries, modern and B.L.

The Austro-Hungarian forces and dispositions, as established by the Serbians, were as follows:—

*River front from Shabats E.*: 55 battalions, almost entirely Land-sturm.

*Shabats-Machva-Loznitsa front* (V. Army, in order from left to right Krauss, VIII., XIII.): 87 battalions.

*Loznitsa-Lyuboviya* (VI. Army, XV., XVI. Corps, 40 Honved Divs., and other troops): 110 battalions.

South-west of Lyuboviya: mountain troops (1-2 brigades).

On the 7th, the VI. Army attacked and pushed the Serbian III. Army off the entire Guchevo ridge, and bore back the I. Army<sup>2</sup> and the right of the Uzhitse Army till the latter, marking the extreme left of the battlefronts, stood on Trsvana Stena.

On the 8th the retrograde movement of the III. and I. Armies continued to the line Kozaninograd (pt. 706) on Tser-Strasha (1424)—Zavlaka-Petrina Stena-Proslup. Meanwhile, the Serbs on the Machva retiring to the line Kozaninograd-the Dobrava were under strong pressure. Next day, in the midst of general activity on the water, an Austrian regiment forced the passage of the Danube at Semendria, threatening an inroad in the Morava valley itself, and part of the Belgrade force was hurried E. to deal with this threat, which it did successfully.

The reports from the front had already decided Putnik to withdraw to a line covering Valeyvo, viz. Obrenovats group, Kolubara mouth to Skela; II. Army, Ub-Blizonzhski heights; III. Army, Yantina-Kamenits; I. Army, Yolina Breza-Sovachki Kik; Uzhitse Army, right Trsvana Stena-centre and left Vishegrad to river Lim. But it soon became apparent that a stand could not be made on this line. *Moral* was low, with mixture of units considerable. In the two Drina divisions of the II. Army in particular men feared for their families and considerable numbers left the ranks and made their way home, while accompanying the retreat were hundreds of refugee families with their carts and beasts, fugitive or requisitioned. From the interior, new drafts came up in thousands and congested Valeyvo.

Though the army was by no means in dissolution, it was undisguisedly in full retreat. By order of G.H.Q. communications were destroyed in the retirement.

The line now to be taken up was the so-called "Kolubara line," which from the rear followed that river to the confluence of the tributary Lig, then, by the Lig to Gukosi and thence by height 700 to the Maleny ridge at Maleny (point 997). The Kolubara part of the line (with a defensive flank along the Sava) was to be held by the Obrenovats group; from just below Lazarevats to Maleny inclusive was allotted to the II., III. and I. Armies west. The Uzhitse Army was to leave one brigade at Kadinyacha on the ridge between Rogatitsa and Uzhitse, the remainder astride the Vishegrad-Uzhitse road at Shargan.

By the evening of Nov. 14, the Obrenovats detachment had taken up its positions behind the Kolubara, the II. Army had fallen back from Kotsilevo towards Lazarevats and the Middle Kolubara, the III. Army, always manœuvring so as to extricate its right before its left could be turned, was astride the Yadar-Valeyvo road at the water parting about Kamenitsa, and the I. Army continued the line S. to Velovitsa, with its Rogatitsa detachment (somewhat out of touch) pushing the left in the

<sup>2</sup> The I. Army was short of Danube II., which had been taken to strengthen the II. Army N. of Tser. Habitual disregard of the order of battle, i.e. an unnecessary regrouping, has been criticised as a peculiar failing in the Serbian method of conducting operations. Often, of course, there was no alternative. But there seems some justification for the criticism, nevertheless.

higher mountains. By the evening of the 16th, the positions were:—Obrenovats group, Obrenovats-Konatitsa; Cavalry division, Konatitsa-S.W. of Stepyevats; II. Army, Voluyak-Lazarevats-Chavka; III. Army, Chibutkovitsa-Ivanovatsa; I. Army, Gukoshi-Mednik-Bachinovats-Ruda-Malyen; Uzhitse Army, right S.E. of Yasenovats-Yelova Gai, and left Shargan and Leshka Gora.

The weather was terrible, but Potiorek, sure of success, drove on his troops to new efforts, although communications became worse and longer day by day. On the 17th the cavalry at Konatitsa was threatened, and had to be reinforced, while the mountain troops of the XVI. Corps, pushing along the ridge of Malyen, reached Strazara (pt. 1000). On the 18th the position of Choka on the front of the II. Army was attacked. But the main bodies of the invaders' columns were not yet up to the front. The Serbs thus enjoyed a relative respite, and their left, at Malyen, was able to reestablish patrol communication with the Uzhitse Army.

On the 19th the Austro-Hungarian main bodies began to exercise general pressure, their efforts being specially directed on the angle of the Kolubara and the Lig, and on the point where the line crossed the Yadar river (Gukoshi and Mednik heights). On the 20th the battle followed the same course, and Putnik ordered an offensive to be resumed on both flanks. But the time was not ripe, and the army and divisional generals reported themselves unable to carry it out.

On the 21st the Austrian XVI. Corps broke the Gukoshi-Malyen line in its centre and the defence was brought back to Gukoshi-552-Rayats-Suvobor-Malyen, and on the 23rd the Malyen position was evacuated and touch with the Uzhitse Army again lost. Nothing now intervened between the XVI. Corps and the head of the western Morava valley, but the weather and the distance of its supply sources, and the liability of the convoys to be cut off by descents of the Uzhitse Army, imposed caution, and for some days only minor fighting occurred here.

In reality, it was not here that Potiorek intended to win his victory, but farther north. The initial phase of the operations was complete when Valyevo was in his hands, and secured against attack from the S. by a sufficient foreground. The next was to be the driving back of the Serbs from the Lower Kolubara, the cutting off of Belgrade, the opening of the Obrenovats-Valyevo railway for supply, and finally the advance in the dry and not too hilly country N. of Lazarevats into the Morava valley, accompanied in its last stages by a descent upon Chachak and Gorni Milanovats in the enemy's rear.

The weather had, however, converted the poor roads of the Ub country into deep mud, and the regulation military transport foundered in this mud, so that the intended rapid advance by Krauss and the VIII. Corps to the Kolubara had been impossible. The mountain troops had outpaced the scheme, and it was not till the 22nd that the Austrian V. Army was able to open a real attack on the Kolubara. By the 25th it had made good the passage, but progress was slow, and at that date only Chopka and Konatitsa had fallen. Obrenovats still held.

Putnik had now resolved to give up Belgrade. Ammunition was expected, but had not arrived. *Moral* was becoming lower and lower, and only ruthless concentration on essentials would enable the army to last till the day when, with pouches and wagons refilled, counter-offensives could be launched. Meanwhile, his policy was to fight for time, so as to evacuate Belgrade as thoroughly as possible.<sup>1</sup> Then the Belgrade and Obrenovats forces were combined and posted on the line Varovitsa-Kosmai-Sibnitsa (night of 29-30th), in touch on the right with the Pozharevats (or Branicovo) force, which held the Danube front astride the Morava. The Austrians entered Belgrade on Dec. 1.

On Dec. 2 the Serbian positions were as follows:—  
*Belgrade-Obrenovats force*, Varovitsa-520-313-Rogacko Brdo-281.  
*II. Army* (4 divisions and cavalry division), Sibnitsa-Olbrezak-Ravani (318)-Medvyednik (365)-Vayán (490).

<sup>1</sup> Some French naval guns had to be blown up, as they could not be removed. Before destruction they fired all their ammunition into Bezania.

*III. Army* (3 divisions), Mramor (398)-Kalanyevitsa-489-520-Motika (603).

*I. Army* (4 divisions), (now commanded by Mishich), Nakuchani-Vrnchani-Sinoshevti-Galich (703)-Vuskova Glavitsa.

*Uzhitse Army* (equivalent of 2 divisions), Kita-Kablar-Ovchar-Markovitsa.

On the Austro-Hungarian side they were:—

*V. Army: Combined Corps and VIII. Corps*, area E. of Lower Kolubara and S. of Belgrade; *XIII. Corps*, Arapovats-Irbushnitsa-Parlog-Liplye.

*VI. Army: XV. Corps*, Vrlaya-Golubats; *XVI. Corps*, Vranovitsa-Leusitsi-Ruyevitsa (583), detachments Godun, Pozhega, Arilye.

Both opponents were by now almost worn out. Suffering from their exertions, their losses, and the absence of food, shelter and ammunition, they were held together only by the inertia of the system. In this condition victory would fall to that side which first found a stimulus. This came to the defenders in two forms, the example of the old King, who took a rifle and fought in the ranks, and the arrival of the long-expected ammunition.

On the night of the 2nd, while Potiorek was slowly regrouping his forces to develop the attack on his left, Putnik issued orders for a general offensive S. of Sibnitsa "in order to profit by the enemy's present weakness and raise the *moral* of our troops."

The II. Army was to drive the enemy over the Kolubara; the III. (Drina II. and "Combined" division) to push towards the old line on the Lig; the I. to make good the line Krivareka-Lozany-Teochin (in order from right to left, Timok II., Morava II., Danube I., Danube II.); of the Uzhitse Army the available portion of Shumaja II. to attack N. and N.W. along Pranyani and Goina Gora; the Lim detachment to attack between the Lushnitsa and Venchaska streams by Breziak N.; the remainder of this undispersed army standing fast or forming a defensive flank for the advancing centre.

The counter-offensive was delivered or launched on the morning of Dec. 3, and was quite unexpected by the Austrians. The Uzhitse Army's offensive wing reached a line astride its assigned ridges marked by Ruyevitsa and Godun. The I. Army drove the XVI. Corps back to the line Byezna-Ozrem-Kriva Reka. The III. Army reached the line Vrlaya-Lipet, the I. Okressak-Barosevats-295-347, while on its right the cavalry maintained contact, at Slatina, with the defensive right flank, the Belgrade-Obrenovats force.

Next day the Uzhitse Army's advance was sharply arrested, and it only maintained its ground on the line 370-Ruyevitsa-Godun-Oruyevitsa-Krstats. But the I. Army drove a deep wedge, and by nightfall occupied Golubats-Prostruga-Rayets-Suvobor-Babina Glava. The III. and II. Armies met with stiff resistance. The III. made no progress, and the southern wing of the II. was hung up by the unshaken resistance of Kremenitsa; the N. wing reached Arapovats and Sakulya. No serious fighting occurred on the part of the cavalry or on that of the Belgrade-Obrenovats force, and the commander of the latter, fearing that an envelopment was in progress, extended his right to the heights E. of Grotska. Next day Putnik, conscious also of the danger of allowing the regrouped Austrians to break through into the Morava region and envelop his right, caused the II. Army to extend its right (Timok II.) past Vitnitsa to Kosmay heights, behind the cavalry. The attack of the centre was in fact at a standstill, and it was evident that it was impossible to defeat the enemy's leftward regrouping of flank attack.

On this day (Dec. 5) the Uzhitse Army's attack, numerically weak and divided amongst several directions, came to a standstill. But the success of the I. Army on the ridge of Prostruga was made definitive, the Austrian XVI. Corps brigades retiring N. towards the Kolubara with heavy losses.

On the 6th the I. Army pursued its opponents N. and downhill towards Valyevo, while on the left of its flank the Uzhitse Army made advances N., N.W. and W. against weakening opposition, and on the right the III. Army reached the line of the Lig. But simultaneously, the storm broke on the extreme right, where the slowly prepared attack of Krauss and the VIII. Corps was launched at last. The line of defence held, but Timok I. from the II. Army was set in motion for the extreme right.

On the 7th, while the I. and Uzhitse Armies continued their advance to Valeyvo and Uzhitse respectively—their opponents withdrawing divergently on the Loznitsa and Shabats routes—the III. turned the flank of the defenders of Kremenika and thus enabled the II. Army, weak as it now was, to make progress towards Lazarevats and Voluyak height. But on the right the Austrian attack made real progress and approached the advanced line of the Kosmay position. On the 8th and again on the 9th the Kosmay line itself was taken and retaken. On the evening of the 9th the alignment of the Serbian defensive flank was from the Danube E. of Grotksa, by Umchari, Varovnitza, and Kosmay to the Kolubara valley near Sakallia. Lazarevats was reoccupied by troops of the II. Army on the 9th, and the III. Army, coming up into line with the I., bordered the Kolubara as far as Valeyvo, these two armies beginning the pursuit of those Austrian forces which had taken the Shabats direction in their retreat.

The 9th was in fact the turning-point of the battle, as the 3rd had been that of the campaign. On the evening of that day Potiorek, ill informed of the state of affairs in the N., and deeply impressed with the defeat of the mountain troops (VI. Army) which he had himself accompanied and directed, gave orders for a general retreat on Belgrade, Shabats and Loznitsa. On that day also Putnik issued general directions for the continuance of an offensive which was evidently yielding much greater results than those aimed at in the instructions of Dec. 2.

The position of affairs on which the new scheme was based was heavy and apparently increasing pressure on the Kosmay front (VIII. and Krauss), indicating an attempt to break through into the Morava region; stiff resistance of the enemy (XIII. Corps of II. Army) between that front and the Kolubara, and on that river astride the Ub routes; and full retreat of the Austro-Hungarian XV. and XVI. Corps in the divergent directions of Shabats, Loznitsa and Vishegrad.

Putnik's objects were two: to follow up the retreating XV. and XVI. Corps quickly so as to regain possession of the national territory and rescue the inhabitants, and to attack the enemy northern forces frontally and in flank before they could prepare a winter position on the Belgrade loop. Attacked all along the front and threatened on their right, he hoped that the Austrians would evacuate the capital without ruinous street-fighting. Some hopes were no doubt cherished of cutting off the retreat of the two corps (VIII. and Krauss) but they were slight. The physical conditions were adverse. "Our national mud," hitherto Putnik's ally, became now a hindrance.

On the 10th, therefore, the Uzhitse Army continued to pursue in the direction of Bainbashta and Rogatitsa, part of the I. Army pushed along the Loznitsa road, part towards Shabats, while the III. Army, with its left already over the Kolubara S. of Ub, began to wheel to the N., pivoting on Lazarevats, with the outer flank following the direction of Ub-Obrenovats.

But already on that day, the battle at Kosmay diminished instead of increasing in intensity. The Austrians began to draw back. Hopes of completing the wheel of the III. Army vanished. The Austro-Hungarian XIII. Corps gave ground only slowly. The renewed *moral* of the Serbs had sufficed to give them victory, but it could not force them through the phase of exploitation, when it was evident that the enemy was evacuating the country of his own accord and also that he would not be hustled. Had the Ub-Obrenovats direction been assigned to troops of the I. Army, which alone of the five larger formations had really experienced the sensation of clear victory, it is possible, though by no means certain, that the envelopment might have succeeded. As it was, the last phase of the battle was practically a frontal drive E. of the Kolubara, with heavy local fighting and the gleaning of prisoners and spoil, but no *débâcle*. When on the 13th the left division of the III. Army seized Obrenovats, the Austrians had already withdrawn clear of the flanking threat. They had, owing to the state of the VIII. Corps, decided not to make a stand on the Belgrade loop, and after one day's further fighting, they evacuated Belgrade which the Serbian patrols reoccupied at 10 A.M. on the 15th. Meanwhile, Shabats, Loznitsa and Bainbashta

had been reached and reoccupied by the pursuing columns of the I. and Uzhitse Armies.<sup>1</sup>

The recovery of the country and the capital intact, and the capture of 41,000 prisoners and 133 guns, with large quantities of stores, even though no Sedan had been achieved, constituted a victory that was both decisive and—after a crisis of *moral* such as that of the end of November—wonderful. It gave Serbia peace in the midst of World War for a few months to come. But her losses had been very heavy. In the three battle periods of 1914, 69,000 Serbian soldiers had been killed or had died of sickness, perhaps 15,000 had been taken prisoners, and probably 180,000 had been wounded, out of a mobilized force which at the outset numbered 490,000.

## II. THE CONQUEST OF SERBIA, 1915

When the third punitive expedition ended in failure, Potiorek was relieved of the command, and the V. and VI. Armies were fused in one called the "Balkan Forces," to which the Archduke Eugene was appointed as commander, with Krauss as his chief-of-staff. Under cover of outposts along the rivers, the corps were reorganized and disposed for the defence of Hungary. Soon the VIII. and XIII. Corps were withdrawn for service in other theatres, and on Italy's entry into the war the Archduke and Krauss were transferred to Laibach to command the new front, General Tertszyanski being left with a much weakened force opposite the Serbs. The latter indeed were not fitted for the offensive. Not only were their numbers greatly reduced by the battles of 1914, but an epidemic of typhus devastated their ranks still further.

Meanwhile, Falkenhayn, reasoning not in the spirit of a Bosnian viceroy who wished to teach a lesson, but in that of a modern war-manager, had become convinced of the necessity of opening a road to Turkey for the transit of munitions and expert personnel. The desire to reserve or to recoup forces for this purpose went so far, indeed, that he constantly imposed a brake on Hindenburg's and Conrad's proposals for decisive operations in the Russian theatre. At one time in the spring, the beginnings of a German army were assembled in Hungary, though the scheme—at that period only one of clipping off the N.E. corner of Serbia—was abandoned before effect had been given to it. Later, when the first fear of the Italians had died away, and the Russian campaign was nearing its end, it was taken up again.

Throughout the spring and summer negotiations had been in progress for winning, or buying, Bulgaria's active support. Falkenhayn exercised all his influence to keep these alive, even under difficult circumstances, for though Bulgaria's price was high, without Bulgarian aid no forces that could be spared from other fronts would suffice for the clearance of the Orient railway, while the nature of Bulgaria's reward imposed the conquest of Macedonia in addition to the military occupation of N. Serbia. There were, further, internal difficulties between the two allies on the question of command. Bulgaria insisted on a German commander as chief, and found in this matter, naturally, Falkenhayn's entire support, but Conrad, ever jealous of the prestige of the Austro-Hungarian army and hostile to German control, long refused his consent. It was not, indeed, until the verge of the offensive that a formula acceptable to all these states was discovered.

The plan of operations adopted was the reverse of Potiorek's, and was substantially that proposed by Krauss and by Tertszyanski successively, viz., direct attack over the Sava and Danube, coupled with a coöperative attack from the Machva, for the securing of the Kolubara line and its railway. But it had the further element of Bulgarian intervention on the right rear of the defence which, if energetic and controlled as to timing and direction by the same commander-in-chief as the frontal offensive, would be decisive. The appointed commander-in-chief of the group of armies was Mackensen. He was to have under him the reconstituted XI. German Army (Gallwitz), the reconstituted

<sup>1</sup> During the period of the Kolubara campaign, there was a certain amount of minor fighting between the Montenegrins and the Austrian forces of Bosnia and Herzegovina, on the Drina, about Artovats, and about Trbinje. No results of importance were achieved on either side.

Austro-Hungarian III. Army (Köves), and one Bulgarian army, the I. Another, smaller, Bulgarian army (the II., Todorov), not under Mackensen's command, was assembled for the seizure of Macedonia. The political treaty of alliance was ratified on Sept. 4, at Sofia, the military arrangements embodied in a convention at Pless on the 6th. According to the latter, within a period of 30-35 days, Germany and Austro-Hungary were to engage 6 divisions each and Bulgaria 4 (each equivalent in infantry strength to 2 normal divisions).<sup>1</sup> Another Bulgarian division was to operate, as above mentioned, into New Serbia (Macedonia).

Accordingly, Köves's army, consisting of the Austro-Hungarian VIII. and XIX., and the German XXII. Res. Corps (seven divisions), was assembled in Syria, and Gallwitz's III., IV. Res. and X. Res. Corps (also seven divisions) in the Banat.

The Bulgarian I. Army (Boyadiev) (1st, 5th, 6th and 8th Divs.) was disposed in the region of Vidin, Kula, Belogradchik and Tsaribrod. The small Austrian forces still available in Bosnia after meeting the demand of the Italian front, were to operate in the Upper Drina region, to hold the Montenegrins in check.

On the Serbian side, there was a definite and perhaps a decisive inferiority in numbers. Battle in 1914 and typhus in 1915 had cost the little country 125,864 dead by Oct. 1 1915, without counting permanently disabled men and prisoners. Gaps had been made good by calling up two new conscript classes, and the ration strength had increased to 572,171 in August. But this figure was far in excess of that available for fighting service—indeed, the German intelligence staff estimated the latter at not more than 200,000.

The Serbian dispositions were generally as follows:—Drina front from the Lim to Bainabasha, Montenegrin forces; Middle and Lower Drina, Machva to Kolubara (exclusive), III. Army (Yurichik-Stürm), 3 divisions; Kolubara to Grotzka, Belgrade force (Zhivkovich); the Lower Morava, II. Army (Mishich), 3 divisions; general reserve, Palanka, 2 divisions and cavalry division; in the N.E. angle were the Braničevo and Kraina groups.

On the Zaječar-Knzajchevats front, the Timok army (Goykovich), on the Nish-Pirov route and to the S. as far as Vranja, the II. Army (Stepanovich), and on the routes into Bulgaria, E. of Uskub, Boyovich's group, comprised 4 divisions and 3 Ban formations.

These dispositions, which at first sight seem to dispose in cordon, weak everywhere, at least five-sixths of the available force, indicate not only a sense of the danger impending on the E. side, which the Western Powers had forbidden Serbia to meet by a preventive offensive, but also the hope of assistance from Salonika. The help of Greece was invoked under the terms of the treaty of alliance of 1913, that of the Western Powers had been promised, if tardily and with reservations. To deploy, facing N., with three-fifths of her forces, and to guard the route to Salonika with the remainder, was, in sum, Putnik's plan.

As against an attack supported by artillery on the 1914 scale, there would have been no reason to suppose that this type of defence would be less successful than it had been in the Kolubara campaign. One line after another could be defended, and when the dead point of the offensive was reached, the reinforced defenders would deliver the counter-stroke of reconquest.

But tactics, unhappily for Serbia, had advanced since 1914, notably German tactics. Discreet reconnaissances, under the direction of the German Lt.-Col. Hentsch, chief-of-staff of Mackensen's group of armies—the same who had borne so grave a responsibility at the Marne—had been carried out for weeks past, for the purpose of fixing of battery positions and working out technical details of the Sava and Danube passages. Searchlights were assembled, large troop barges constructed, and for the protection of the main crossings heavy artillery was massed.<sup>2</sup>

<sup>1</sup> An interesting sidelight is thrown on the relations of the allies by the fact that Germany thought it necessary to require from Bulgaria a written guarantee of unimpeded transport freedom through Bulgarian territory.

<sup>2</sup> In the case of the Belgrade crossing, no fewer than 20 batteries of heavy and superheavy artillery were collected, nearly half of which consisted in 30-5 and 42-cm. howitzers, and 18-cm. long guns. In addition, 90 field guns and howitzers were engaged.

Oct. 6 was fixed as the initial day for Köves<sup>3</sup> and Gallwitz, the 11th for the Bulgarians.

The bombardment opened on the 5th, laying towns and villages in ruin all along the line; but on the Serbian side only outposts held the river lines, local reserves being kept under cover.

Köves's main crossing place was to be Belgrade, opposite which place technical preparations had been multiplied and two corps out of three assembled. The third (XIX. Austro-Hungarian) was to pass the Drina at Byelyina, and the Sava at Shabats, Kupinovo, Progar and Zabrezh, in order to create bridgeheads and to prevent the defenders from concentrating to the eastward.

Gallwitz's crossings were to take place at Ram and at Semendria, on each side of the Morava mouth, opposite which points lay the railheads, and at the island of Temes Sziget between them; the attack was to be accompanied by a demonstration from Orsova and a Bulgarian threat towards Negotin.

On Köves's front the secondary crossings, especially in the Machva, secured footholds on the S. side of the water, but all attempts to advance out of the waterlogged river valleys themselves were checked (Oct. 7). Opposite Belgrade, in the early morning hours of the 7th, the first boatloads of troops of the VIII. Corps pushed off into the stream under cover of innumerable searchlights, heavy artillery fire, and monitor activity, while a little way up the Sava the XXII. Res. Corps put over its advanced troops into Ostrovo Tsiganiya (Gipsy Island). Zhivkovich had 16 battalions and nearly all the Serbian heavy artillery, including French and British 6-in. guns, to oppose to them. The landing—the only operation in the World War analogous in form and spirit to that of the Gallipoli Peninsula—succeeded, but only after the fiercest fighting was the foothold really made good and room secured on the front of both attacking corps for the passage and deployment of large forces. On the night of 9-10th, Zhivkovich abandoned the attempt to hold the town, and fell back a little way S., on the line Zarkovo-(249)-Visznitsa.

Simultaneously, Gallwitz's 3 corps had been launched, on both sides of the Morava. Preceded by a demonstration at Orsova on the 6th, the left corps (X. Res.) forced the passage at Ram on the night of 6-7th, and drove inland, over the Anatema heights to Kuryatse, threatening Pozharevats from the north-east. The IV. Res. Corps (3 divisions) seized Temes Sziget Island with little difficulty and reached Brezhani (Brežani). But the front from Semendria to Gatsko defied the III. Corps, and not only protected the right rear of Zhivkovich, but gave time to Putnik to bring troops from the Machva.<sup>4</sup>

Nevertheless, it was clear by the 11th that the river barrier was lost and Putnik began a steady policy of fighting successive delaying actions on the N. front, while at all costs keeping back the Bulgarians on the right and rear, in order to gain time for the arrival of French and British aid, the first elements of which had already reached Salonika.

On the 12th Mackensen opened the general advance, in the midst of a gale which, known as the *Kossova*, descends seasonally upon the country from the south-east. Köves made slow progress till the 16th, when the Serbians evacuated under pressure the Petrov Grob-Avala-Velika Kamen line, and fell back to Melyak-Ripany—line of R. Ralya.

Gallwitz by that date had enforced the evacuation of Pozharevats, cleared the way for his III. Corps to advance on the Semendria front, and brought his left flank to Bozevats. To the E. of Köves, the Austrian offensive was a simple follow-up of the retiring Serbs, who now attempted no real defence W. of the Kolubara, though small forces with local riflemen delayed the Austrians long enough for the families and the live stock to be evacuated on Valjevo. The Montenegrins, and with them some Serbs, were maintaining a particularly independent struggle between the Yadar and the Lim.

By this time the Bulgarian advance on the right flank had begun, though some days later than had been intended. In the south, Todorov's II. Army (7th Div. with improvised formations)

<sup>3</sup> The Drina portion of Köves's army was, however, behind time.

<sup>4</sup> All Austrian forces in Bosnia were late in their preparations and took no effective part in the offensive.

prepared to threaten the flank of the Salonika railway from Strumitsa, the Ovchepele from Kjustendil, and Vranja from Trn. The I. Army advanced on the various routes to attack Zayechar, Knyazhevats and Piro; on these the Serbs had advanced to meet them, always with the idea of gaining time, and by the 16th very little progress had been made by the invaders, except by one regiment which by a daring mountain march seized Vranja and cut the railway there. This success weakened the position of the Serbian forces on the Egri Palanka road at Stratsin, and when, farther S., Todorov turned their right by Kochana and pushed cavalry to Veles, they evacuated the Ovchepele (Oct. 18-19). On the 21st Uskub itself fell into the hands of the Bulgarians and the Salonika line was lost, though a counter-attack recovered Veles from the Bulgarian cavalry two days later.

At that moment for the first time, the French from Salonika came into action, threatening Strumitsa and Todorov's left. It was too late.

On the northern wing of the Bulgarian army, Boyadiev's central columns cut the road between Zayechar and Knyazhevats on the 21st, and farther to the Bulgarian right, Negotin was occupied by the invaders, who there made contact with the Orsova detachment of the XI. Army. The Serbs in this quarter offered little resistance, their rear being already threatened by Gallwitz's progress in the Morava valley.

In that region the fighting had been heavy, the weather severe, and it was not till the 19th that Mackensen's two armies mastered the Ralya line. On the 21st, the date on which the Bulgarians seized Uskub and the French came on the scene at Strumitsa station, Mackensen's N. front was marked by the line Shapina-Selevats-S. of Kosmay. On the 23rd it lay on the line Lazarevats-N. of Arangelovats-N. of Palanka-Petrovats, and the Serbian eastern fronts began to be in difficulties, though some days were still to elapse before Goykovich's force finally disappeared and junction was effected between Boyadiev's right and Gallwitz's left. In W. Serbia the Austrians from Bosnia were beginning to be active, and the country-side was being evacuated by men, women and children, with their animals and belongings. From Uzhitse as well as from Valjevo, the emigration had set in towards Novipazar.

Putnik's left armies were now falling back concentrically towards Kraljevo-Krushevats, in proportion as his E. front caved in. On Oct. 30, after no light efforts, the XIX. Austro-Hungarian and XXII. Res. Corps of Kövess's army were S. of Gorni Milanovats, the VIII. Austro-Hungarian Corps S. of Raibrovats, Gallwitz's army to the S. of Lapovo-Petrovats. The Serbs had evacuated Zayechar on the 25th, Knyazhevats on the 27th, and after a fierce resistance and repeated counter-strokes from Piro, Stepanovich had retired on Bela Palanka on the 29th. Farther to the S., Todorov's attention had been thoroughly attracted to the Strumitsa side, and the position at Uskub and on the Upper Vardar had scarcely changed.

From Nov. 1 onwards, the final desperate effort was made by the Serbians to gain time for the arrival of the French and British by holding the arc Chachak-Kraguyevats-Yagodnya-Nish-Leskovats. Still the Bulgarians were held back in this phase, but the Germans and Austrians steadily advanced. Kraguyevats fell, with its arsenal, on Nov. 1; Yagodnya on the 3rd, Kraljevo on the same day, Paratyn on the 5th. For some days longer the defence continued stubborn on the S. side of the W. Morava and about Varvarin in the Morava valley, where a salient was held to enable the last elements of the Serbian IV. Army (Goykovich) to extricate itself from the closing vice. But by the 9th the defence on this line was at an end, and Mackensen was preparing the dispatch of the XXII. Res. Corps to another theatre, having received the Alpine Corps (division) in lieu.

On the E. front meantime, Stepanovich's counter-attacks had completely held up the Bulgarians at Bela Palanka, while a great part of the population flowed away through Nish into Kosovo. It was not until Nov. 4, when Boyadiev had received a fresh division (the 9th) and Paratyn had fallen, that orders were given to evacuate Nish, and that centre was held by rear-guards till the 5th. Leskovats resisted till the 7th.

The Orient railway, the objective for which Falkenhayn had planned the campaign, was now clear from Germany to Constantinople, and with his usual economy he was already thinking of withdrawing the German forces to other theatres.<sup>1</sup> The Serbian army, plainly in dissolution, had ceased to be a menace to the Danube monarchy. But new problems were arising—the Albanian question, the problem of Greece and the Allied Salonika army, the question of a submarine base on the Aegean. In all these, each of the three victors had a different standpoint, and fresh difficulties set in between the three Governments. 'Belonging as they do to the Salonika phase of the Balkan campaigns, these problems will not be dealt with here, and it only remains to describe, briefly, the last stages of the Serbian tragedy.

Substantially, the results of the Bulgarian coöperation had fallen considerably short of what was expected. The tough resistance of Stepanovich, and even of the small IV. Army in the N.E. corner, had kept back the eastern danger until it was too late for an envelopment. Indeed, considerable portions of Boyadiev's army—those oriented on Negotin and Zayechar, if not also that on the Knyazhevats route—were already crowded out of the closing front. For effective envelopment of the Serbian right, there only remained the N. portion of Todorov's II. Army, and, with the increasing arrival of French and British in the region of Rahovo and Doiran, this Bulgarian general was obliged to be cautious, while encircling attack upon the Serbian left was practically excluded by the fact that the Bosnian forces had made a late start and were traversing very difficult country. Supply and weather conditions, moreover, were becoming serious for the invaders. Practically, nothing could now prevent the remnant of the Serbian army from escaping into Albania, should it choose to do so.

But for this desperate measure, which would involve the loss of all war material and of many thousands of lives in the roadless, snow-bound interior of Albania, the Serbian command was not yet prepared. It seemed preferable to attempt to break through towards the S., where the long-expected Allied army was now advancing and Todorov was in difficulties.

The II. Bulgarian Army had, after seizing Uskub and taking, losing and retaking Veles, moved out fan-wise against the mountains N.W. and W. of Vranja, Kachanik, Kalkandelen, and the Babuna pass, while its extreme left was on the defensive against Sarraill's Rahovo group, and its left centre column was moving down from Shtip on Krivolak and Kavadar, where also Sarraill was collecting a considerable force. In the existing conditions it was evidently more important, from Todorov's point of view, to bar the Vardar valley against Sarraill than to attempt to force the mountain barrier of the Kara Dag and the Shar Dag. He therefore placed his centre of gravity well to the S., leaving his N. flank covered by a mixed force drawn partly from the I., partly from the II. Army.

Against this force, Putnik assembled the remnants of 5 divisions E. of Prishtina, and with them assumed the offensive with all the violence of which his troops were still capable, on Nov. 9.

This began on the 9th, driving the Bulgarian group of General Ribarov back to Vranja in the one direction and towards Kumanovo in the other. By the 15th Ribarov's right was in extreme difficulties. But the arrival of part of the I. Bulgarian Army from Leskovats on the left rear of the attacking wedge rescued it. By now the general front of the Austrian and German pursuit had reached Uvats, the line of the Ibar, Yaver (Javor), Kurshumlye. Pressure on the rear was too close to allow of persistence in the southward break-through. The moral rally which had permitted that attempt was dying away on all the defended avenues, and Putnik made up his mind to escape through Albania with what could be saved of the army and the people. Between Nov. 20-25, the historic Kossovopolje witnessed another last effort of the Serbian people, then everything flowed away towards Ipek (Pech), Dyakovo and Prizren.

At these points the pursuit ceased in the first week of December. It had practically become Bulgarian alone. Such German

<sup>1</sup> As above mentioned, Mackensen was given orders almost on the battlefield to send away the XXII. Res. Corps.

troops as remained in the theatre when Falkenhayn's orders had been carried out were sent down the Vardar, into the midst of the Bulgarian II. Army. The Austrians diverged into Montenegro, which was completely occupied, with some severe local fighting and much secret negotiation, by the third week in Jan. 1916. But the end of pursuit did not mean rest and reorganization for the poor remnant of the Serbian army. It was impossible to live at the halt; and a midwinter march through the Albanian mountains, brought those whom its rigours left alive to the coast of the Adriatic. Thence, after some delay, they were transferred to Corfu, where the Western Powers provided food, equipment, clothing and stores, so mitigating a disaster that they might have prevented. (C. F. A.)

**SERVIA:** see SERBIA.

**SETON-KARR, SIR HENRY** (1853–1914), British big-game hunter, was born in India Feb. 5 1853. Educated at Harrow and Corpus Christi College, Oxford, he was called to the bar in 1879, but developed a taste for travel and big-game hunting which carried him all over the world. He also interested himself in state colonization and was a member of the Royal Commission on Food Supplies in Time of War. He published *The Call to Arms* (1900–1) and *My Sporting Holidays* (1904). He represented S.W. Lancs. (St. Helens) in the House of Commons from 1885 to 1906 and was knighted in 1902. He lost his life when the "Empress of Ireland" sank in the river St. Lawrence May 29 1914.

**SEX** (see 24.745\*).—The problem of the determination of sex has in recent years been greatly elucidated. Knowledge has come from several sources. Both breeding experiments and cytological observation have severally led, as will be seen, to concordant conclusions, proving that the sex of the offspring is generally decided by one or other of the germ-cells which unite in fertilization. But though in ordinary circumstances the mode of determination is now known, there are nevertheless indications that in special cases the normal course may be altered or at least disturbed by various influences, the operation of which is not understood. The reconciliation of this latter class of evidence with the former has not yet been satisfactorily effected.

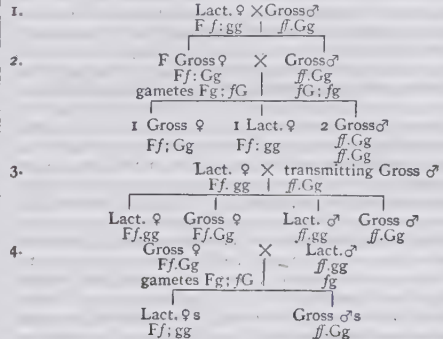

*Sex Determined by Spermatozoa.*—Knowledge of sex-determination began with the observation of Henking (1891) that in certain insects the spermatozoa were of two kinds, (1) those which contained a supernumerary, unpaired, or accessory chromosome (see CYTOLOGY), now generally called the X-chromosome, and (2) those without this body. McClung (1902) first suggested that this chromosome might be a determiner of sex, and took it to be the peculiarity of the male, but Miss Stevens (1905) and E. B. Wilson (1905), to whom the development of this part of the subject is chiefly due, proved that the spermatozoa bearing the X-chromosome are in these animals destined to form females. The eggs are alike in each possessing an X, and thus the somatic or diploid cells of the daughters come to have 2 X, one received from their mother and one from their father, whereas the diploid cells of the sons have one only, received from their mother. Since the gametes of the male are of two kinds, that sex is said to be *hetero-gametic*, the female being *homo-gametic*. Further observation, however, showed that the organization of even nearly allied genera of insects is by no means uniform in respect of the sex-chromosomes. Though unpaired in the males of some genera, the X may in others have a pair or "mate" of smaller size, known as the Y-chromosome. Between these and other genera in which the male has a pair of sex-chromosomes not visibly different from each other there are several transitional conditions. In a considerable number of forms also, the X is represented by a group of separate chromosomes, regarded as collectively the mates of the Y.

The X-chromosome has been seen in several orders of insects, especially Hemiptera, Orthoptera and Coleoptera, in spiders, myriapods and some nematodes. In man it is said (Guyer) to be represented by a pair corresponding to a single Y-chromosome.

*Sex Determined by Ova.*—Naturally this discovery that the male is hetero-gametic was at first supposed to be of universal application, but the next advance, which resulted from experimental breeding, showed that this simple view could not be enter-

tained. The Currant Moth (*Abraxa grossulariata*) has a variety *lacticolor*, characterized by a deficiency of black pigment, till then known only in the female. Doncaster, instituting experiments with this variety, found that by breeding such females with normal males the  $F_1$  family consisted of males and females, all normal.<sup>1</sup> Interbred, these gave  $F_2$  composed of two normal males: one normal female: one *lacticolor* female. But *lacticolor* ♀ ×  $F_1$ ♂ produced families containing normal ♂, normal ♀, *lacticolor* ♂ and *lacticolor* ♀, all in equal numbers. On breeding any normal *grossulariata* ♀ with the *lacticolor* ♂ now produced, the sons were all *grossulariata* and the daughters all *lacticolor*.

Other interpretations have been proposed, but it is evident that the eggs of the *grossulariata* ♀ are of two kinds, (1) those which are destined to be females, and do not carry the *grossulariata* factor, (2) those which do carry this factor, and are destined to be males (Bateson and Punnett). Taking the factors G, *grossulariata*: g, its absence; F, femaleness: f, its absence, the results may be represented symbolically thus:—

*Sex-Limitation and Sex-Linkage.*—Such a system of heredity is sometimes called "sex-limited," and the descent of the character so limited serves as an indication of the mode by which the factor determining sex is transmitted from parent to offspring. The proof that in these moths sex is determined by the eggs, or in other words that the female is the hetero-gametic sex, is thus complete. The same has been shown to be true of birds. In fowls, several conditions have been shown to be sex-limited to females; e.g. *black* as against the *cuckoo-markings* of the Plymouth Rock; *golden* (as in Sebrights or Hamburgs) as against *silver*; the *black pigment* of Silky fowls is suppressed by a sex-limited factor which inhibits this development, etc. In canaries the peculiar form of albinism known as *Cinnamon*, and in doves the pale albinotic variety shows a similar behaviour. We have thus to recognize that, paradoxical as it may appear, sex is in some animals determined by the sperm, and in others by the eggs. Man belongs to the former class. Apart from the cytological evidence, as yet unconfirmed, the descent of sex-limited conditions, notably colour-blindness, demonstrates this. Substituting male for female, colour-blindness, is transmitted in man exactly as the *lacticolor* character is in the moths. A colour-blind man mated with a normal woman has sons and daughters with normal colour-vision. The sons cannot transmit the colour-blindness, but the daughters transmit it to half their sons who are therefore colour-blind. Moreover, when the transmitting female is mated with the colour-blind man, the *colour-blind female* is produced, just as in the corresponding mating (3) in the *grossulariata* experiment, the *lacticolor* male was formed. Finally when the colour-blind woman mates with a normal man the sons are all colour-blind and the daughters are all transmitters. Following Doncaster's notation in the *grossulariata* scheme, if M, maleness, be substituted for F, and N, normal colour-vision, for G, the same analysis represents the observed facts: the transmit-

<sup>1</sup> In genetics the following symbols are frequently used: ♀ = female; ♂ = male; × = mated with; F<sub>1</sub>, F<sub>2</sub>, etc. = the first filial family, the second, etc.

ting female (Nnmm) in man, for example, corresponds with the male Ggff, etc.—in *grossulariata*.

There is thus no doubt that just as in the bird and the moth the female produces two kinds of eggs destined respectively to form females and males, so in man the male produces two kinds of sperms destined to form respectively males and females.

*Cytological Interpretation.*—The notation given above provides the simplest representation of the empirically observed facts without any attempt to refer them to cytological phenomena. This attractive branch of Genetics has been actively developed by T. H. Morgan and his colleagues with remarkable success; and though serious difficulties remain, the incidence of the sex-limited characteristics can so readily be interpreted as depending on the distribution of sex-chromosomes, observed or hypothetical, that a causative influence has with great plausibility been attributed to them. Starting from the now familiar fact that in certain animals the XY male has visibly one X-chromosome and the XX female two, it is argued that the "double dose" of X is the cause of the female characteristics and that one dose of the same element produces the male attributes. If, then, in such animals the dominant factors, which show linkage, be supposed to be also carried in the X-chromosome, the sex-limited distribution of the negative characteristics to males will result. At first sight the fact that in other animals the female is hetero-gametic seems irreconcilable with this scheme, but, by making the assumption that in these females a similar cytological apparatus exists, the genetic observations may be represented on the same plan as that adopted for the hetero-gametic males. For the hetero-gametic female may be represented as XY and the male as XX, and here again if the X carries the positive element, say the G of *grossulariata*, then the gamete of the composition XG is always destined to the sons, and Yg to the daughters, as the facts require. Perhaps the strongest evidence in favour of the chromosome hypothesis has been found in the phenomenon of "non-disjunction" in *Drosophila*, the fruit-fly, whose genetical composition has been studied more fully than that of any other organism (see GENETICS). In this creature sex-limitation is to males, and the female is hetero-gametic; but, exceptionally, unexpected forms appear, as, for instance, red-eyed males in the mating where white-eyed alone should normally be produced. Bridges found that in such individuals and among the families containing these abnormal members, irregularities in the occurrence of the chromosomes could be demonstrated. Apparently in some maturation division two X-chromosomes had passed to the same egg, others receiving none. From this a series of exceptionally constituted gametes are derived which could have brought about the observed exceptions. Another line of argument pointing to the same conclusion has been derived by Morgan and his associates from a study of gynandromorphs—the curious individuals composed of more or less irregular patchwork of male and female tissues, which are formed with some frequency especially among the various orders of insects. A number of these have occurred in the pedigree families of *Drosophila*, and on analysis it was found possible in almost every case to refer the characters shown in the several parts to their parental origin.

A primary objection to these modes of interpretation is that the cytological conclusions rest on a still slender basis of observation. As regards the forms with hetero-gametic females an unpaired chromosome has been reported to exist in the females of two moths (*Phragmatobia* and a *Psychid*), but on the other hand, Guyer states that in certain birds the male has an unpaired chromosome. Commonly, moreover, no consistent cytological distinction between the two sexes can be observed. But a still more fundamental difficulty besets the conception of the characteristics of either sex as dependent on a merely quantitative distinction. From arguments which cannot be here developed the Y-chromosome is regarded as demonstrably empty, and containing no determining elements, and XY is therefore to be understood as in potentiality merely the half of XX. Chemical phenomena, vaguely analogous, have been appealed to as making this system of interpretation less inadmissible than it at first appears, but that it is beset by grave objections cannot be denied.

Cytology has been of great assistance in codifying the apparently contradictory records as to the intricate series of parthenogenetic or agamic and sexual forms of the Hymenoptera and Hemiptera. We have learnt for example that in Hemiptera (Morgan; von Baehr) when fertilization produces females only, the fact is due to the death of all the sperms, which do not bear the X-chromosome. But in these groups it not rarely happens (*Neurolelus*, Doncaster) that the fertilized females give rise parthenogenetically to other females of which, without fertilization, some produce females only and others males only, but no cytological distinction between these two types of females has been seen. Whatever be the true cytological account of sex-determination, we have nevertheless to recognize that femaleness and maleness respectively, though similar throughout the Metazoa both in outward manifestations and in deeper physiological features, are constructed upon at least two distinct genetic plans. To reconcile the infrequency of visible cytological distinctions between the sexes with the chromosome hypothesis it has been suggested that the critical bodies are in such cases attached to other chromosomes, but this, though undeniable as a possibility, is as an argument dangerously tinged with obscurantism, a comment which applies to many of the subordinate hypotheses supporting the chromosome theory of genetic causation.

The situation is one through which many scientific problems have passed before final solution has been obtained. By independent lines of evidence conclusions largely identical have been reached. The facts are not in dispute, but a consistent interpretation of the whole series has not at present been obtained.

*Disturbance of Normal Sex-Ratios: the Production of Inter-Sexes.*—Hybridization is not rarely followed by a disturbance of the normal sex-ratio. From canary females crossed with other finches and from domestic hens crossed with cock-pheasants male mules (sterile) are easily bred but female mules seldom if ever. Among Bovidae some crosses give fertile females but sterile males (S. v. Nathusius) and the same occurs in a cross between species of caviars (Detlefsen). Among Lepidoptera a series of such examples are known, the first having been observed by Standfuss, who called attention to the absence or scarcity of females in many species-crosses. Recently Goldschmidt, working with races or species of *Lymantria dispar* brought together from many countries, carried out a remarkable series of experiments. He found that a Japanese race used as ♀ × European ♂ gave normal males and females, but that in the reciprocal cross though the males came normal, the females were intersexes, exhibiting many transitional stages, approaching males in various degrees both in form, colour and instincts. When Japanese males of certain races were used, the whole of the female offspring are said to have been thus transformed into males. Goldschmidt states that the various races can be arranged in an ascending scale according to the completeness with which these effects are produced, but the phenomena showed many complications not as yet adequately represented, notably the appearance of partially transformed male intersexes in the F<sub>2</sub> generation raised by inter-breeding the normal offspring raised in the first experiment. It has been pointed out by J. B. S. Haldane (1920, unpublished) that, apart from certain exceptions, a general principle can be perceived in this group of phenomena. If in hybrid offspring either sex is consistently missing or defective, this will be the hetero-gametic sex, e.g. in birds and Lepidoptera the female, in mammals, the male.

*Sex of Twins.*—The facts hitherto dealt with all go to prove that sex is determined by the gametic contribution made by one or other of the parents and that this is the normal course is not open to question. In harmony with that conception of sex-determination, it is found that when, as in twinning of embryos and generally when the fertilized egg multiplies by division, the products are commonly all of the same sex. In the armadillo (*Tatusia novem-cincta*), studied in detail by Newman, four embryos, demonstrably arising by division of one blastodermic vesicle (developing ovum), are usually produced at a birth and are always of the same sex, the four being all males or all females. Patterson found an exception in the case of the parasitic

Hymenopteron *Paracrepidomopsis*, which by polyembryonic division sometimes produces both males, females and intermediates. That something analogous to non-disjunction here occurs is an acceptable interpretation of this anomalous instance. But there is a remarkable group of incontrovertible facts which show that sometimes the normal course of sex-development may be disturbed. F. Lillie discovered a remarkable example. When in horned cattle twins of opposite sexes occur, the female is sometimes sterile, being called a free-martin. It might be thought that these twins arose by division of one fertilized ovum, but Lillie by study of material from the Chicago stock-yards proved that an ovum had dehisced from each ovary and that therefore the twins were originally distinct. He further showed that sometimes the twins had an actual anastomosis between their foetal circulations. The presence of a male embryo must therefore be regarded as having the power of inhibiting the development of the female embryo, poisoning it in so far as the formation of the reproductive organs is concerned.

*Effects of External Conditions.*—Disturbance of the normal sex-ratios as a consequence of various interferences, such as starvation, high or low temperature, etc., has several times been alleged to occur, especially in Amphibia, and the evidence of R. Hertwig that delay in fertilizing the eggs of the frogs causes the production of a preponderance of males has been fully confirmed. Circumstantial details preclude the obvious suggestion that this is a result of differential mortality. Hertwig thought that inasmuch as the polar bodies are excluded very late, after the eggs are laid, his result might perhaps be reconciled with the conception of cytological pre-determination if the conditions of the experiment could in some way have decided which elements should be retained in the egg and which ejected in the polar body. Recently Seiler has made an observation of this kind in regard to a Psychid moth, *Talaeporia*. He states that if the females are kept in a high temperature while the eggs are undergoing maturation, it can be seen on cytological examination that the accessory chromosome more frequently remains in the egg, and that as a matter of observation more males are produced, the converse occurring under cold conditions. Until we know definitely which sex in Amphibia is hetero-gametic the discussion can scarcely be carried further, but the frequency with which transitional forms are found in the Ichthyopsida raises a probability that the facts are of a higher order of complexity. As to the genetical composition of the Amphibian intersexes, an important observation has lately been made by Crew. From the eggs of a female fertilized by a male showing intersexual characters 774 tadpoles were reared, all females. According to Baltzer, sex in *Bonellia* is directly determined by the conditions of larval life. The female is of course an animal of considerable size, whereas the male is a minute creature parasitic on her. Larvae which find the proboscis of the female and attach themselves to it are said to develop into males, those which remain free-swimming becoming females. Larvae artificially detached from the proboscis become intersexes. Adequate controls, by which the hypothesis of predisposition may be excluded, would in such an instance be most difficult to institute.

*Effects of Castration.*—Collateral evidence bearing on the nature of the distinction between the sexes has been drawn from many sources, especially from the results of castration, but though the facts thus empirically observed are of much physiological interest, they have no very direct bearing on the primary problem. The reproductive glands, acting chiefly, if not entirely, by virtue of the secretions (hormones) of their interstitial components, have often a great influence on the development and maintenance of secondary sexual characters, but the part played by the hormones must obviously be of a secondary nature. Removal of the genital glands has divers effects in various animals. In good agreement with the discovery that in the bird the female is the hetero-gametic sex, it is found that both in the fowl and the duck (Goodale) the removal of the ovary induces the plumage and some other characteristics of the male. The female is thus an organism in which the male attributes are concealed or recessive, whereas a capon does not develop hen-feathering.

Moreover, Morgan found that in the Sebright bantam, the males of which are "henny" in plumage (not in combs or wattles), after castration the cocks acquire ordinary male plumage, which may naturally be interpreted to mean that the hen-feathering of these cocks is due to their possession of part of the female complex which has been transferred to them. Morgan and Punnett also have shown that the henny character behaves as dominant in breeding, a fact which proves that the dominance proper to the whole female complex of the bird pertains also to that part of the complex which controls the plumage.

Castration performed on moths during the larval stage has not produced modification of secondary sexual characters (Oudemans). In crabs, however, the destruction of the testes by certain parasites produces very striking "feminization" of the abdomen and appendages (Geoffrey Smith), but we do not know which sex in Crustacea is hetero-gametic. We are without a satisfactory interpretation of this group of observations, some of which superficially considered seem to run counter to the facts of gametic determination already established, but the disturbances of the normal course may commonly, though perhaps not always, be conceived of as due to interruption of the chain of events by which the full effects of gametic pre-determination are developed.

*Hermaphrodites.*—Attention should be called to a remarkable lacuna in our knowledge of sex-determination. Up to the present nothing has been yet discovered either by cytological or analytical methods as to the genetical relation of the hermaphrodite types among animals to those in which the sexes are distinct. In plants a little progress has, as will appear, been made, pointing to the conclusion that the hermaphrodite is dominant, containing something which the females at least do not, but as to hermaphrodite animals nothing can be said with confidence. This is much to be regretted, as the whole subject might be greatly advanced by such knowledge.

*General considerations.*—From the observation that the two sexes are formed by modification of a common structural plan, and from the fact that by interferences, of which some have been mentioned, individuals cytologically, or at least gametically, destined to be of one sex may be made to assume more or less of the characteristics of the other, the conclusion has often been announced that each sex contains the other latent in it. To this expression, in the light of modern knowledge, no precise meaning can be attached, and it probably conveys nothing of essential truth. The primary sexual distinctions evidently depend on factorial elements which follow more or less closely the familiar principles of Mendelian segregation. The determining factor for sex should probably be regarded as a complex, usually transmitted in its entirety, but capable by accidental errors of cell-division of being disintegrated, so that the elements responsible for special characteristics may become detached from the rest and may even be passed over to the sex which normally does not receive them. For example, the races of fowls which do not incubate have presumably thus lost a portion of the dominant sex-complex; the hen-like cocks of the Sebright bantam may be represented as having acquired that ingredient of the female sex-factor which in the normal female inhibits the formation of the sickle-feathers and hackles of the cock, and so on. A similar representation may be applied to those cases (e.g. Phalaropes) in which the cocks are hen-like and normally incubate the eggs. It is not unreasonable to suppose that the transference of an actual fragment of critical material, presumably a portion of a chromosome, is responsible for the physiological abnormality. The literature of obstetrics and of stock-breeding abounds with nostrums for the arbitrary regulation of sex in man and the domestic animals, but from what is accurately known of the mechanism of sex-determination, nothing favourable to these claims can yet be adduced. Nor can any explanation be offered of the fairly constant departures from equality which normally occur in man and various domesticated animals. In the pig, ox and rabbit the male births are said sensibly to exceed the female, but in the horse and sheep there is a small excess of female births. The races of man show definite differences in the proportions of the sexes at birth. Of living births, taking females at 1,000, the males for England and Wales

were for some time slightly below 1,040, which, though about the same as the proportion in Japan, is somewhat low in comparison with Germany, several European countries, and the white population of the United States, in which the males are about 1,060. On the other hand for the coloured population of the United States the male births are still less in proportion (in the year 1890, 1,024) and occasionally fall actually below the female number (1908 in 1900). In all countries for which data can be obtained the proportion of males among *still-births* is very largely in excess of the females. Such divergences usually point to differential mortality or to the action of lethal factors, but in view of the large excess of males among still-births this account is not readily applicable here. The excess of males (surviving infancy) is exceptionally large in certain, though not all, of the families affected with the tendency to bleed profusely from trifling injuries, known as haemophilia. This is one of the sex-linked abnormalities appearing in males which follow much the same system of descent as colour-blindness. Illegitimate births in most countries show a distinct diminution in the excess of males.

Since the publication of Düsing, the proposition which he (following earlier writers) developed, that war produces an increase in the proportion of male births, has been widely disseminated. S. Newcomb investigated data as to births in the United States during the Civil War but found no positive result, and other parts of the evidence have been declared to be fallacious. Nevertheless, statistics for Great Britain and also those for Germany during the World War show a progressive rise which can scarcely be deemed insignificant. It should be remarked, however, that this rise had begun in Prussia some years before the war. On the other hand, no similar change has taken place in the neutral countries. For an adequate consideration of the facts many concomitant phenomena must be taken into account; for example, the fact that the total birth-rate of Prussia fell in the war period to less than half. Whatever be the immediate cause of the rise in male births, it is likely that it should be referred to the incidence of a differential pre-natal mortality rather than to any more fundamental genetic process.

*Sex in Plants*.—The attempt to make a factorial analysis of sex in the higher plants has not led to clear conclusions. Dioecious plants suitable for experiment are few. Correns, from results obtained in reciprocal crosses made between *Bryonia dioica* and the monoecious *B. alba*, inferred that the male of *dioica* was heterogametic, but the argument did not amount to proof. Shull's experiments with *Lychnis dioica* and a variation having the elements of both sexes present together were also beset with many complications and obscurities. In dioecious mosses the Marchals proved that segregation, in respect of sex, normally occurs at spore-formation, but both their experiments and those of Collins gave indications of further complexities. *Sphaerocarpos*, a liverwort, produces spores in tetrads, and of the four, two became males and two females. C. E. Allen states that the female spores each receive an accessory chromosome larger than that which passes to the male spores. Blakeslee showed that *Mucors* consist of several strains which may be called + and -, and that conjugation only takes place when a + culture comes into contact with a - culture. These strains may with great probability be regarded as two sexes, but the results were complicated by the discovery of other strains which are indifferent. We meet here the same difficulty noted in the case of animals, that the factorial relations between hermaphrodite plants and the dioecious forms have not yet been successfully represented. Varieties having the stamens to a greater or less degree aborted are not uncommon among the species of flowering plants which are normally hermaphrodite. If the deficiency is extreme, the variety is not merely in function female, but it is in a condition morphologically not distinguishable from the females of plants dioecious in the strict sense such as *Lychnis dioica* or *vespertina*. When such female varieties are fertilized with pollen from the hermaphrodite type the resulting family may be a mixture of hermaphrodites and females, but not rarely females only are produced. As the hermaphrodite is a dominant this evidence demonstrates that the hermaphrodite factor must thus be relegated to the female side,

the male side taking the recessive in which the anthers are aborted. Such "unilateral" distribution of the factors may exist in regard to colour, double flowers and probably many other factorial distinctions, and the conception of sex-linkage is in a special and limited sense applicable to them (C. Fellow). Otherwise nothing comparable with the sex-linkage of animals has yet been discovered in plants. It must always be remembered that, on account of the complications created by the existence of a syncopated alternation of generations in the higher plants, no direct parallel between sex, as manifested in them, and that of animals can be instituted.

**SGAMBATI, GIOVANNI** (1843-1914), Italian composer (see 24.757), died at Rome Dec. 15 1914.

**SHACKLETON, SIR ERNEST HENRY** (1874-1922), British polar explorer, was born at Kilkee Feb. 15 1874. He was educated at Dulwich College, and afterwards entered the merchant service, subsequently becoming a lieutenant in the R.N.R. In 1901 he joined the Antarctic expedition of Capt. Scott in the "Discovery," but had to return home on account of ill health. In 1908 he organized his first Antarctic expedition, largely fitted out by himself, which started from New Zealand in the "Nimrod," and achieved important results, reaching a point on the Antarctic continent about 97 m. from the South Pole (see 21.968). For this he was knighted in 1909, also receiving the C.V.O., while the Government contributed £20,000 towards the expenses of the expedition. He equipped a second expedition which left England in the "Endurance," Aug. 1 1914, with the idea of approaching the Antarctic continent from Weddell Sea and ultimately joining hands with another party whose ship, the "Aurora," was to start from Australia and approach by way of Ross Sea. Owing largely to bad ice conditions, the expedition was almost uniformly unfortunate (see ANTARCTIC REGIONS). The story of this expedition was related by Sir Ernest Shackleton in *South* (1919). He received the King's

Polar medal and many honours from learned societies. In addition to the work mentioned above, he published *The Heart of the Antarctic* (1909). In 1921, in the "Quest," he organized a third expedition, which set sail in September; but while it was still on its way he died from an attack of *angina pectoris*, on board, off Georgia I., Jan. 5 1922.

**SHANGHAI**, China (see 24.799).—During 1911–21 the population and trade of Shanghai expanded steadily, as the result of the development of the port's railway communications with the interior and of the increasing development of cotton-spinning, shipbuilding and other industrial enterprises. At the same time the wealth and importance of the foreign settlements rapidly increased, chiefly because of the large number of Chinese officials, capitalists and political refugees who sought there security from the civil strife and disorders prevalent throughout the interior after the revolution.

The city's rate of expansion is reflected in the maritime customs returns, which show that the gross value of the trade of the port in 1919 amounted to 768 million taels, which, at an average exchange of 55. 8d., represents £217,000,000. In 1908 the sterling value of the trade was £40,400,000. The changed conditions of international commerce brought about by the World War were manifested in the fact that in 1919, for the first time, the United States took the first place in the list of Shanghai's foreign trade, with a margin of 28 million taels over that of Japan, thus reversing the position occupied by the two countries in 1918. The trade of Great Britain, which before the war headed the list, showed signs of recovering some of its lost ground, especially in the matter of Manchester cotton goods.

The total pop. of Shanghai, as estimated by the Imperial Maritime Customs, was 1,000,000 in 1916, an estimate which included the inhabitants of the native city as well as those of the international and French settlements; but the actual total to-day must be considerably higher, for the Chinese pop. of the international settlement alone was 620,401 in 1915, and was estimated at 673,000 in June 1919. No reliable statistics are forthcoming in regard to the population of the native city (which displays but little evidence of the reformers' activities) nor of that of the Chinese-controlled suburbs of the foreign settlements, but it may be assumed to be increasing, while that of the French municipality has grown very rapidly since its boundaries were enlarged and its area developed by a progressive scheme of road construction. The foreign pop. of the international settlement in 1919 was calculated to be 22,000; at the last census (Oct. 1913) the total was 18,519, of which number 7,169 were Japanese, 4,822 British, 1,323 Portuguese, 1,307 Americans and 1,155 Germans. After the conclusion of the Russo-Japanese War, the number of Japanese residents increased much more rapidly than that of any other nation, but as the franchise for the election of the Land-renters' Executive Council is limited by property-owning or tax-paying qualifications, the British community still retains its predominant influence in municipal affairs. The Land-renters' list at the beginning of 1920 showed 1,100 British voters, as against 300 Japanese, 230 Americans and 150 Germans. The steady expansion of the revenues collected by the self-governing Council of the International Settlement (in which the Chinese Government has no jurisdiction) affords evidence of the growth and prosperity of the city during the past decade. In 1911 the rates and taxes collected were 2,589,628 taels; in 1919 the total was 4,419,961. The street traffic returns are significant not only of rapid growth but of changing conditions. In 1911 the council licensed 11,111 jinrikishas, 1,277 carriages, 217 motor-cars, 5,310 wheelbarrows, 199 sedan-chairs and 958 carts; the corresponding figures for 1919 were 14,726 jinrikishas, 831 carriages, 1,378 motor-cars, 8,667 wheelbarrows, 18 sedan-chairs and 2,141 carts. Industrial enterprise during this period was greatly stimulated by the improved facilities for the transport of raw materials provided by railway construction in the interior; cotton-mills, in particular, increased rapidly, the number of these at Shanghai at the close of 1920 being 26, with a total of 901,898 spindles. Factories were also established for the making of flour, cigarettes, matches, etc., and, as in Japan, a new development of the retail trade was manifested by the establishment of large department stores, conducted on European and American lines.

The political importance of Shanghai, as the headquarters of Young China and a sanctuary for political refugees of all descriptions, naturally increased during and after the upheaval of the Chinese Revolution. Many wealthy and conservative officials of the old régime sought and found security for themselves and their property within the limits of the extra-territorialized Foreign Settlements; later, in 1913, the expulsion of the Kuo-Mintang politicians from Peking by President Yuan led many of these southern Parliamentarians to make Shanghai their headquarters, and each succeeding year of civil strife added to the numbers of those who sought shelter from its widespread dis-

orders under the shelter of the municipality. Nor were the political refugees all Chinese, for, after the revolt of the Koreans against the Japanese Government in 1919, "the Provisional Government of the Korean Republic" established itself at Shanghai. Thus the little spot originally set apart as a place of residence for foreign traders came by force of circumstances to be the birthplace and centre of political activities in China, the vernacular press at Shanghai (including several of the most influential newspapers in the country) being generally in opposition to the policy of Peking and in sympathy with the views of the student class. By common consent of the contending factions, the Peace Conference convened in 1919 to discuss the differences between the Peking Government and the southern "Constitutionalists" was held in the neutral territory of the international settlement. An interesting feature of Young China's political activities in 1919–20 of particular importance to the future of Shanghai lay in its increasing insistence, on the one hand, on the abolition of the foreigners' extra-territorial rights and, on the other, on the recognition of the Chinese taxpayers' claim to a share in the direct executive government of the settlement, a claim which (while morally undeniable) would, if successful, effectively put an end to the conditions by virtue of which the Foreign settlements have afforded security for life and property during periods of widespread disorder in China.

See George Lanning and Samuel Couling, *The History of Shanghai* (1920). (J. O. P. B.)

**SHANNON, CHARLES HAZELWOOD** (1865– ), English painter (see 24.801), was elected A.R.A. in 1911, and in 1918 became vice-president of the International Society of Sculptors, Painters and Gravers. His more recent works include "The Amethyst Necklace" (1907), "The Morning Toilet" (1912), "The Embroidered Shawl" (1914), and "The Incoming Tide" (1918); while in 1918 he produced various portraits, including those of Princess Patricia of Connaught, Miss Lillah McCarthy, and Miss Hilda Moore ("The Lady in Black"). Among his lithographs may be mentioned "Playmates" (1908), "Ebb Tide" (1917), "The Tidal River," and "A Sharp Corner" (1919). In 1920 he was elected R.A.

**SHAUGHNESSY, THOMAS GEORGE SHAUGHNESSY, 1ST BARON** (1853– ), Canadian railway president, was born at Milwaukee Oct. 6 1853, his parents being Irish. He was educated at St. Gall's academy, Wisconsin, and began his railway service at the age of sixteen. In 1882 he joined the staff of the Canadian Pacific as general purchasing agent, and by 1891 had risen to be its vice-president. From 1899 to 1918 he was president and chairman of the board of directors, as well as a director of all the allied lines. He was knighted in 1901, created K.C.V.O. in 1907, and raised to the peerage of the United Kingdom as Baron Shaughnessy of Montreal and of Ashford, co. Limerick, in 1916. His two sons, William James Shaughnessy (b. 1883) and Alfred Thomas Shaughnessy (b. 1887) served in the Canadian Expeditionary Force during the World War, and the younger was killed in action in 1916.

**SHAW, ANNA HOWARD** (1847–1919), American reformer, was born at Newcastle-upon-Tyne, England, Feb. 14 1847. When she was a small child her parents moved to Massachusetts, and soon afterwards to Michigan, where her father cleared a farm, 40 m. from the nearest post-office and 100 m. from the railway. From 1872 to 1875 she studied at Albion College, Mich., and in 1878 graduated from the Theological School of Boston University. The district conference of the Methodist Episcopal Church granted her a local preacher's licence, and she held pastorates at Hingham and East Dennis, Mass., remaining in the latter place seven years, until 1885. Meanwhile the New England Conference of the M.E. Church refused to ordain her because of her sex, and the refusal was upheld by the General Conference at Cincinnati in 1880. But the same year she was ordained in the Methodist Protestant Church. While preaching she had studied medicine and received the degree of M.D. from Boston University in 1885. She was then chosen lecturer for the Massachusetts Woman's Suffrage Association. The following year she was made national superintendent of franchise of the Women's

Christian Temperance Union, serving for six years. She was also associated after 1886 with the National American Woman's Suffrage Association as lecturer, vice-president-at-large, and from 1904-15 as president, when she declined reelection. She had spoken in every state, before many state Legislatures, and before Congressional committees. She was a member of the International Council of Women; the International Suffrage Alliance; the National Society for Broader Education and the League to Enforce Peace. In 1917 she was appointed chairman of the woman's committee of the Council of National Defense, and in 1918 edited for this committee a department in the *Ladies' Home Journal*. She died at Moylan, Pa., July 2 1919, shortly after the passage of the suffrage amendment to the Federal Constitution by Congress. Her last message was an appeal to women to use their influence for the ratification of the League of Nations. She was the author of *The Story of a Pioneer* (1915, with Elizabeth Jordan) and joint editor of *The Yellow Ribbon Speaker* (1891, with Alice Stone Blackwell and Lucy Elmira Anthony).

**SHAW, GEORGE BERNARD** (1856- ), British dramatist (see 24.812), produced on the London stage subsequently to 1910 *Fanny's First Play* (1911), *Overruled* (1912); *Androcles and the Lion* and *Great Catherine* (1913) and *Pygmalion and The Music Cure* (1914). He also produced in Dublin, or at special performances in London, the one-act plays *O'Flaherty, V.C.* and *Augustus does his Bit* (both satires on problems of the World War), *The Inca of Jerusalem* and *Anajanska*, and published a three-act play *Heartbreak House* (1919), produced in New York, and also in a German version in Vienna in Nov. 1920. A few months after the outbreak of war he published, as a special supplement to *The New Statesman*, an outspoken deliverance on "Common Sense and the War," which occasioned much comment and earned him some unpopularity. In 1921 he published *Back to Methuselah*. (See ENGLISH LITERATURE.)

**SHAW, JOHN BYAM** (1872-1919), English painter, was born at Madras Nov. 13 1872, the son of John Shaw, registrar of the high court of Madras. He came to England in 1878, and his first art teaching was obtained at the St. John's Wood school of art. He entered the Royal Academy schools in 1889, and his picture "Rose Mary" was hung in 1893. One of his best-known works was "Love the Conqueror" (1899). He illustrated a great number of books, among them being Browning's *Poems* (1898); *Tales from Boccaccio* (1899); *Pilgrim's Progress* (1904); Edgar Allan Poe's *Tales* (1909), etc. In 1911 he established, with Rex Vicat Cole (b. 1870), a school of art at Kensington. He died in London Jan. 26 1919.

**SHAW, RICHARD NORMAN** (1831-1912), English architect (see 24.813), died at Hampstead Nov. 17 1912.

**SHAW, SIR WILLIAM NAPIER** (1854- ), British meteorologist, was born at Birmingham, March 4 1854. He was educated at King Edward's school, Birmingham, Emmanuel College, Cambridge, of which he became a fellow in 1877, and the university of Berlin. From 1887-99 he was university lecturer in experimental physics at Cambridge, from 1898-9 assistant director of the Cavendish laboratory, and from 1899-9 senior tutor of Emmanuel College. In 1891 he was elected a fellow of the Royal Society. In 1897 he became a member of the Meteorological Council, and was from 1900 to 1905 its secretary, in the latter year being appointed director of the Meteorological Office. In 1907 he became reader in meteorology in the university of London. He was president of the mathematical and physical section of the British Association in 1908 and of the educational section in 1919, and in 1919 was president of the International Conference of Meteorologists held in Paris. He was knighted in 1915, and in 1920 retired from his position at the Meteorological Office. Sir Napier Shaw's works include *Life History of Surface Air Currents* (with R. G. K. Lempfert, 1906); *Air Currents and the Laws of Ventilation* (1907); *Forecasting Weather* (1911); *Manual of Meteorology* (1919); besides many papers in scientific journals and valuable reports of meteorological and other subjects. He received many honours and distinctions, including the Symons medal of the Royal Meteorological Society.

**SHELL-SHOCK**, the popular name given during the World War to an obscure form of nervous disease which became rife among the armies. The term "shell-shock" appears to have been officially adopted in Great Britain in 1916, although cases to which this term might have been equally applicable had occurred in the English and French armies from the beginning of the war and onwards. It is probable, although it is not recorded, that similar cases occurred in previous bloody wars; but never before have such vast numbers of men been subjected to such terrific strain, dangers and horrors from forces generated by explosives. In consequence thereof the term "shell-shock," applied to all forms of war psycho-neurosis, found ready acceptance by the press and public, but by neurologists it was generally regarded as a misnomer—unless it were strictly limited to cases of concussion or commotion of the brain directly caused by the violence of the forces generated by the explosion.

Early in the war, and subsequently, cases of sudden death of groups of men without visible external signs of injury were recorded. They were particularly noted when the explosive forces were generated in confined spaces, where percussion and repercussion would be intensified in their effects upon the cerebro-spinal fluid, which acts as a water-jacket to the central nervous system and especially protects the vital centres in the medulla from concussion. Carbon-monoxide poisoning was also considered a possible cause of such a death, and especially was this likely in the case of explosion of mines or the imperfect detonation of shells in closed spaces, such as dugouts, saps or ravines.

The great majority of cases diagnosed as "shell-shock" were not *commotional* in origin, but *emotional*, and due in most instances to the existence in the sufferer of an inborn timorous, neuropathic or psychopathic disposition; but in a certain number of cases an emotional instability was acquired by the prolonged strain and stress of war. Thus fatigue, insomnia, anxiety and infective disease frequently combined to cause a neuro-potentially sound individual, with an excellent record of service, to become emotive and to develop "shell-shock," the final breakdown having been precipitated by a shell bursting near to him. The present writer had the opportunity of examining post-mortem the brain in such a case, and it showed rupture of minute vessels and haemorrhages into the substance of the brain and cerebro-spinal fluid.

In the absence of objective signs during life, such as ruptured tympanum, and changes in the cerebro-spinal fluid—for example, the existence of blood—it would be impossible for the medical officers to decide whether such a case was primarily commotional or emotional. This is an important matter, for the former was classed as a battle casualty and entitled the sufferer to a gratuity. The large number of British cases claiming a gratuity for "shell-shock" led to the promulgation of Army Form 'W 3436, which required circumstantial evidence by an eye-witness of the proximity of the soldier to the bursting shell. Even then great difficulties were experienced in coming to a just decision, for a purely commotional case, if not severe, usually recovered more rapidly than an emotional one; consequently a record of service and the severity, character and persistence of symptoms had to be taken into account.

The diagnosis of "shell-shock" was made at the Casualty Clearing and Field Ambulance stations, and when a barrage was opened prior to the attack of the enemy, or other intense shell-fire, medical officers at the front-line stations had little time to investigate the numbers of casualties coming in, and until the later period of the war cases of "shell-shock" were sent to the base hospitals. The wish in a great number of these cases was not to go back to an intolerable situation; and fear, associated with the instinct of self-preservation, arose as an unconscious defence mechanism, and persisted in maintaining such hysterical manifestations as amnesia, tremors, paralyses, contractures, convulsive tics, aphonia, mutism, blindness, deafness and other functional sensori-motor disabilities. Whereas hysterical manifestations were extremely common in the ranks, they were relatively rare among the officers, who suffered from neurasthenia and anxiety neurosis instead. These two forms of psycho-neurosis

in no essential manner differed from those affecting civilians of either sex (see 14.211 and 19.432).

Among the causes which led to the prevalence of cases diagnosed "shell-shock" was the neurological and psychological inexperience of medical officers in the diagnosis and treatment of psycho-neurosis. Another was the degree of discipline, *moral* and *esprit de corps* in a regiment; this largely depended upon the personality of the commanding officer, the medical officer and the quartermaster, their efficiency in performing their duties and their endeavours to supervise the welfare of their men so far as the emergencies of war permitted. Thus confidence and will-power were inspired in the men to face with them any situation, and "shell-shock" cases were relatively few in such regiments as compared with the number of cases in a regiment with poor *moral* and discipline, where suggestion played an important part.

It is generally accepted by medical authorities in England and abroad that the stress and strain of war, including exposure to shell-fire, does not produce psychoses such as epilepsy, manic depressive insanity, dementia-præcox, obsessional psychasthenia, or an organic disease like general paralysis, but it may excite or reveal them. It is, however, admitted that exhaustion or toxic psychoses with mental confusion of a temporary character are often due solely to the stress and strain of war.

*Relation of "Shell-shock" to Court-Martial Procedure.*—As a result of questions in Parliament and a debate opened on April 28 1920 by Lord Southborough, a War Office committee, with Lord Southborough as president, was constituted July 1920 with the following terms of reference:—

"To consider the different types of hysteria and traumatic neurosis called 'shell-shock'; to collate the expert knowledge of the service medical authorities and the medical profession from the experience of the war, with a view of recording for future use the ascertained facts as to its crisis, nature and remedial treatment and to advise whether, by military training or education, some scientific method of guarding against its occurrence can be devised."

In the House of Lords debate, in which Lord Horne, Viscount Peel and Lord Haldane took part, a good deal of attention was devoted to court-martial procedure, and especially in relation to "shell-shock" and to death sentences in connexion with cowardice and desertion. From what was said it seems probable that in the early days of the war, before "shell-shock" was fully understood, a few men were shot who, in the light of further knowledge and experience, could not have been held responsible for their actions. The question arises, When is a man who has pleaded "shell-shock" (taken in its widest acceptance) to be held responsible for and conscious of the quality of his acts? The psychology of the emotion of fear in relation to the instinct of self-preservation and the will-power to control supplies a basis upon which to answer this question. The emotion of fear is associated with three instinctive reactions, as we see in animals: (1) flight; (2) immobility; (3) concealment. In war practically every man, even the bravest, before a battle may experience fear; but a soldier should, by suitable training and confidence in his superior officers, overcome this by will-power, and thus convert the primary reaction of fear into that of anger. How can a medical officer differentiate between cowardice and fear causing an irresponsible lack of will-power in a man to control his actions in the face of difficulties and dangers? The doctor should know the man's personality, his previous record and what his comrades thought of him. It is not so much what he says as what he did, or what he has done, which will help towards a decision. There are, however, certain signs in a man who refuses to go forward in action or who runs away, that show he cannot be held altogether responsible for his action. He may be dazed in consequence of "shell-shock" and be the subject of mental confusion; there may be physical signs of fear over which he has no voluntary control, namely rapid action of the heart, dilatation of the pupils, sweating, blueness and coldness of the hands, often protrusion of the eyeballs, and an expression on the face which is hard to simulate. These conditions, associated with trembling, are sufficient indications of true fear inhibiting the will.

Out of the psychology of fear arises the question whether in recruiting there is any test by which the unfitness for active

service on account of a nervous disposition can be ascertained. And, if so, whether it would be desirable to eliminate from the army such a man without probation. It is a fact that many highly intelligent men with nervous instability may, if suitably trained, develop into most efficient officers and non-commissioned officers. Much depends upon the method of training and on those who undertake the training. A sensitive nature with self-esteem must not be broken by harshness or injustice, which produces a mental conflict ending in an anxiety-neurosis or neurasthenia. It is generally admitted that under no circumstances should an imbecile, an epileptic or an individual who has suffered with a previous attack of insanity be recruited.

For further information the reader is referred to *Parliamentary Debates, House of Lords*, Wed. April 28 1920, vol. xxxix., No. 29. See also Sir F. W. Mott, *Shell Shock and War Neurosis* (1919). (F. W. Mo.)

**SHERMAN, JAMES SCHOOLCRAFT** (1855-1912), American politician, was born near Utica, N.Y., Oct. 24 1855. He graduated from Hamilton College in 1878, was admitted to the bar in 1880, and practised in Utica until 1907. In early manhood he left the Democratic party, became a Republican, and as such was elected mayor of Utica in 1884. In 1886 he was elected to the National House of Representatives and was returned continuously until 1908, excepting the term 1891-3. He was a delegate to the National Republican Convention in 1892; chairman of the Republican State Convention in 1895, 1900, and 1908; and chairman of the Republican National Committee in 1906. For 12 years he was chairman of the House Committee on Indian Affairs—a subject naturally of great interest to him, as he was a relative of Henry R. Schoolcraft (see 24.359)—and the Sherman Institute in California, an Indian school, bears his name. At the Republican National Convention of 1908 he was nominated vice-president on the first ballot and was elected on the ticket with William Howard Taft. Four years later he was renominated, but he died at Utica, Oct. 30 1912, shortly before the elections.

**SHEVKET, MAHMUD** (1858-1913), Turkish pasha, was born at Bagdad in 1858, and from early youth showed marked qualities of intellect and personality. He received his military training at the military college in Constantinople, 1875-80, and after a very brief period of service with the troops was given an appointment on the general staff. Von der Goltz, who at that time was reorganizing the Turkish army, thought very highly of the young Shevket, and it was through his agency that the latter was sent to Germany to manage the reequipment of the Turkish army. As a result he remained from 1884 to 1894 in the small arms factory of Mauser Bros., at Oberndorf on the Neckar. He also studied armament problems in France for a short time, and in 1894, as the reward of his labours, was made inspector of military arsenals in Constantinople. From 1901 to 1903 he was military governor of the Hejaz, in Arabia, then in what amounted to a state of war. He next went in a like capacity to Kossovo (Uskub), and there came in contact with the Young Turk movement, which had its headquarters in Salonika. In 1908 Abdul Hamid averted the break-up of the old régime by summoning a National Assembly. This state of things, however, did not last long. In the spring of 1909 the Old and Young Turks were struggling for supremacy. A powerful Old Turk counter-revolution was prepared, but, in mid-April, the III. Army Corps, under Hussein Husni Pasha, marched from Salonika against Constantinople. At San Stefano Mahmud Shevket took over the command, and, after heavy fighting, forced his way on April 4 into Constantinople. Impressed by his victory the National Assembly no longer dared to oppose the will of the Young Turks, and on April 26 voted the deposition of Abdul Hamid. Mahmud Shevket was the hero of the day. But he did not care for politics, which he considered had been the ruin of the Turkish corps of officers, and preferred to confine his activities to purely military matters. The next few years afforded him plenty of opportunities. In 1910 and 1911 he put down a revolt of the Malissors with great energy, and in 1912 fought against the rebels in Albania. In the summer of 1912 he became Minister of War, and in Jan. 1913 succeeded Kiamil as Grand Vizier. He took a very

active part in army reforms, but he came into conflict with the Union Libérale, which took its orders from Sherif Pasha in Paris, and he was murdered by one of its members on June 11 1913.

**SHIP AND SHIPBUILDING** (see 24.867).—The period from 1910-21 was marked by great progress in shipbuilding; that progress was in some ways interrupted, in others stimulated, by the World War, which overshadowed every phase of development both in commercial and naval enterprise. The naval strengths during ten years after 1921 of the chief nations were restricted as a result of the decisions summarized in the article WASHINGTON CONFERENCE.

The great object of the Allied belligerents during the war being to obtain the maximum output both of war material and of merchant ships on which their supplies depended, those responsible for the building of all types of ships naturally turned their attention to standardization. This had the effect of retarding the adoption of new inventions on the one hand; but on the other the novel circumstances and continued development of material by Germany during the war, and the ruthless use made of that war material, continually called for novel devices and new types of ships to meet and defeat the continually changing and ever-increasing intensity of the campaign. This, whilst it produced many new types of warships and countless devices for their improvement in offence and defence, in the case of many classes of warships, but more particularly in the design of merchant ships, had the effect of developing standardized types, both in Great Britain and later in America, in order to increase the numbers of ships for transport purposes of all kinds and so counter the enormous losses due to the German submarine campaign. After the Armistice, although at first there was an enormous demand for ships of all classes, the slump in trade in 1920-1 and the very high prices of ships had the effect of reducing the demand. In Great Britain many of the warships building after the Armistice were broken up and no new ships had in 1921 been started. The output of merchant ships was in 1921 steadily declining, so that it could not be said that shipbuilding had yet resumed that steady advance which was being made before the war.

The outstanding features which have affected the design of all classes of ships specially are the gradual adoption of oil in lieu of coal as a fuel, the further development of the steam turbine, and, for certain classes of vessels, the progress made with internal-combustion engines (see INTERNAL COMBUSTION ENGINES).

In the British navy, and to a great extent in other navies, during this period, oil most completely superseded coal for steam-raising. At first destroyers were the only type of vessel, apart from submarines, in which coal was altogether abolished as a fuel in the British navy. Then in 1912 light cruisers of the "Arethusa" class had oil only. A little later in that year, in the "Queen Elizabeth" class of battleships oil was decided upon as the only fuel for the first time in a capital ship. Subsequently to that, no British warship proper, with the exception of the "Raleigh" class of 10,000-ton light cruisers, which were destined for world-wide work, had anything but oil as a fuel, and in the "Raleighs" seven-eighths of the power was derived from oil. This change was a very momentous one to make, especially when it is considered that in Welsh coal Great Britain possessed the finest and then the cheapest steam coal in the world. In spite of this, however, the advantages of oil were so great that, when in use it had been found satisfactory, coal was relegated to be the fuel of none but special or auxiliary ships in the navy.

The advantages of oil may be summarized shortly as follows: For the same weight it has 50% more thermal value than coal. It occupies less space and can be stowed in spaces inconvenient for coal and other stores. Boilers with oil remain much cleaner for a long period, so that full power can be kept up indefinitely as long as the fuel lasts. Oil can be easily taken on board at any time, thus not calling upon the crew for the great exertion involved in coaling ship hurriedly, perhaps just before their energies are required for fighting an action. The exertion of stoking is entirely done away with and far fewer men are required in the stokehold, which is always clean and comfortable. With oil also much larger boilers can be used, which saves space in the boiler-

rooms. Though there are other contingent advantages, those named are enough to show that the British Admiralty took a wise course in adopting oil for all fighting ships, and this was amply proved during the war.

Subsequently, owing to the very high price of coal and of wages for firemen, many of the advantages enumerated above induced merchant shipowners to adopt oil in place of coal for high-powered passenger vessels. In low-speed cargo-boats the great economy of internal-combustion engines as compared with steam-engines, makes the advantage of the adoption of oil still more paramount, and the number of these vessels has been largely increased. The comparatively low powers, however, which can be got with internal-combustion engines prevented their being adopted up to 1921 for fast merchant ships or for any warships, except submarines, which generally have comparatively low power and moderate speed. In submarines a much lighter internal-combustion engine than that used for cargo vessels has been developed, with a high number of revolutions.

Another very important advance in marine engines has been gained by the use of toothed gearing. This gear enabling the high number of revolutions in turbines to be reduced, so that large slow-running propellers can be used in conjunction with very quick-running efficient turbines, a much higher efficiency has been secured and increased speed of ship and economy of working has resulted. In its present form this gearing was first introduced in 1910 by Sir Charles Parsons in connexion with the turbine engines of a merchant vessel named the "Vespasian." The success of the trials of this ship led to the further adoption of gearing, and for the British navy it was first tried in destroyers, then in some light cruisers, and was in 1921 gradually coming into use for most war ships and many mercantile ships. The largest ship in which it had been adopted was H.M.S. "Hood."

### I. BRITISH WARSHIPS

Taking the first most important type of British warship, namely capital ships, the naval actions in the Russo-Japanese war of 1904-5 had demonstrated the capital importance of the heavy long-range gun, while the turbine system of propulsion had been sufficiently tested in high-speed passenger vessels and small warships to justify its adoption, at any rate experimentally, in warships of a larger size. These changes were, no doubt, bold ones, both as regards guns and machinery; but the wisdom of their selection for the design of the first "Dreadnought," in 1905, was sufficiently vindicated by subsequent experience, and by the general acceptance of these two features by other naval Powers.

Laid down in Oct. 1905, the original "Dreadnought" proved so successful that from 1907 onwards the designs of British capital ships moved on progressive lines without departing from the essential principle of the "Dreadnought" type, viz. a ship carrying an all-big-gun armament, adequately protected for taking her place in the line of battle, and of a speed at least equal to that of any foreign ship of similar rank.

The next 10 years therefore saw a succession of post-"Dreadnought" battleships in which the primary armament passed from the ten 12-in. guns of the "Dreadnought" through the ten 13.5-in. guns of the "Orion" (all on the centre line of the ship) to the eight 15-in. guns of the "Queen Elizabeth," an increase, within that brief period, of over 126% in the heavy projectile weight of discharge. There was no secondary battery, properly speaking. The "Dreadnought" carried 24 12-pdrs. for repelling T.B.D. attack, but this armament was soon recognized as being too light for the ever-increasing size and power of destroyers, and in subsequent ships up to the "King George V." class (inclusive) batteries of 12 to 16 4-in. guns were mounted as high up as possible to repel the attack of destroyers. In the "Iron Duke" and "Queen Elizabeth" classes 6-in. Q.F. guns were substituted for the 4-in., as the latter weapon was then thought to be insufficient against destroyers and light cruisers.

The speed of these battleships was kept at the uniform level of 21 knots up to and including the "Iron Duke" class. The type of turbine machinery on four shafts, which had proved so satisfactory in the original "Dreadnought," became the standard,

but the growth in displacement necessitated a corresponding increase in power to attain the requisite speed. The use of oil fuel in association with coal was maintained until the "Queen Elizabeth" class was reached, when the greater advantages of oil fuel and the improved methods of its combustion finally caused the abandonment of coal as fuel. A noteworthy feature of these remarkable vessels was the advance in speed to 25 knots, necessitating, on a slightly larger displacement than that of their predecessors, an increase of about 150% in the power.

Concurrently with the development of the battleship proper, that of the British battle cruiser may be followed with advantage. Up to the inception of the "Dreadnought" design nothing more ambitious than an armament consisting of 9-2-in. guns associated with 7-5-in. guns ("Warrior" and "Minotaur," 1903-4) had been attempted in armoured cruisers. But the same reasons which caused the evolution of the all-big-gun battleships from the mixed armament of the "King Edward VII." and "Lord Nelson" classes now called for a similar simplification in the armoured cruiser designs. The outcome of this policy was the production of the "Invincible" class of "cruiser battleships," now generally known as "battle cruisers."

In these vessels the additional power necessary for their 4 to 5 knots superiority of speed over the "Dreadnought" was obtained at the sacrifice of two 12-in. guns and some loss of armour protection. The value of speed, which in battleships had always been a debatable point, was, of course, incontestable for the battle cruisers, and the development of the type has, both before and since the outbreak of the war, kept pace with the insistent demands of the strategist for the highest speed obtainable. Within the 10-year period referred to above, the increase in speed and power from the "Invincible" (25 knots for 41,000 H.P.) to the "Renown" (32 knots for 120,000 H.P.) required an increase in displacement from 17,250 tons to 26,500 tons, the relative increase in power being over 190 per cent. Finally in the "Hood" a speed of 32 knots with 144,000 H.P. on a displacement of 41,200 tons, an increase of 235% in power was involved.

The wisdom of the policy which initiated this new era in naval construction, relegating temporarily into the background the former British supremacy in capital ships, was naturally the subject of much criticism. But evolution in warship construction is not the property of any one navy, and there is little doubt that, at the conclusion of the Japanese war, the world stood on the threshold of a new era in naval architecture. If British naval supremacy was to be maintained it had to be done by leading the world along the new path of warship design, without waiting for others to utilize the advantages that had been rendered possible by progress in armour, guns and machinery. How great an advance the "Dreadnought" represented on previous ships may be gauged from the particulars given in Table I.

TABLE I.—Comparison between "Dreadnought" and the Best Previous Ships.

	"Dreadnought" (as designed)	Best Previous Ship
Number of 12-in. guns carried.	10	4
Length of line of battle for equal number of 12-in. guns on the broadside	Ratio	1 to 2
Total muzzle energy per broadside of 12-in. guns	383,000 (ft.-tons)	145,000 (ft.-tons)
Length of line of battle for equal 12-in. broadside gun power	Ratio	1 to 2.6
Tons displacement per 12-in. gun	1,785	3,750
First cost per 12-in. gun in line of battle	£175,000	£280,000
Annual upkeep of ship per 12-in. gun carried.	£ 34,800	£ 62,300
Speed (knots)	21	19
Endurance:		
At economical speed (nautical m.)	5,800	5,790
At 16 knots (nautical m.)	4,000	3,000

Other navies were not slow to follow the lead given by Great

<sup>1</sup> This includes pay, victualling, repairs, coal, stores, etc., together with an addition of 15% per annum of first cost, for interest and depreciation, etc.

Britain. The veil of secrecy in which the new types were closely shrouded whetted the emulation as well as the curiosity of other nations. Germany, ever ready to reap where others have sown, set about preparing for the change, and two years later produced the "Nassau" class, with 12 11-in. guns as main armament and 12 6-in. guns as anti-destroyer armament. At the rate of three a year she continued to lay down ships of this type—improved in armament as time progressed—each batch being accompanied by a battle cruiser of corresponding power and speed. Other nations fell into step, and, during the five or six years preceding the outbreak of war, produced, with variants appropriate to their several necessities, all-big-gun ships carrying a main armament of 10 or 12 primary weapons grouped in turrets shielding two, three, or even four guns each.

While the German output of capital ships had, once it got under way, continued with methodical regularity, British naval construction had suffered from the vagaries inseparable from divergent political views and aspirations.

Under the "Cawdor Memorandum" of Nov. 30 1905 it had been laid down that the minimum British requirements would be four large armoured ships a year, and the "Dreadnought" with the three "Invincibles" fulfilled this condition, but in each of the two following years only three battleships (and no battle cruisers) were laid down, while the 1908-9 programme only provided for one battleship ("Neptune") and one armoured cruiser ("Indefatigable"). Efforts had been made to induce Germany to curtail her naval expansion—"a year's holiday in naval construction" being suggested—but such hopes as were based on this contingency gradually faded before the inexorable German determination to challenge British sea supremacy. In the 1909-10 estimates provision was therefore made for laying down four capital ships, two in July 1909 ("Colossus" and "Hercules") and two in Nov. ("Orion" and "Lion"), while four "contingent" ships ("Monarch," "Thunderer," "Conqueror" and "Princess Royal") were to be laid down in April 1910, if the German menace showed no signs of abating. So far from this latter being the case, there was an acceleration in the dates of laying down the German ships, and the programme outlined above was therefore punctually carried out. The 1909-10 programme, it will be seen, was a memorable one in the history of British naval construction, and its adoption enabled Great Britain to maintain her naval supremacy, which otherwise would have been jeopardized.

Notwithstanding the atmosphere of uncertainty created by the delays due to hopes of a reduction of armaments, the rate of progress on warships under construction was well maintained, and, with a few exceptions, Great Britain was able to complete the largest battleships within 24 to 30 months of laying down, a performance which compared favourably with the best achievements abroad, and which not even Germany with her methodical preparations was able to equal.

The disposition of the heavy guns in both battleships and battle cruisers had, during the first five years of this period, undergone several important modifications. In the "Dreadnought," "Bellorophon" and "St. Vincent" classes the five two-gun turrets were placed as in the diagram—A being on the forecastle deck, the remaining turrets on the upper deck, giving eight guns on each broadside, six ahead and six astern.

The "Invincibles," which carried one turret (X) less, had the two middle turrets P and Q disposed en échelon, and the superstructure amidships was so arranged as to enable all eight guns to fire on either broadside. The middle turrets were, however, placed so near to one another that serious trouble was experienced from gun blast when firing across the deck. In the battle cruisers of the "Indefatigable" class, and the battleships of the "Neptune" and "Colossus" classes, therefore, where a similar arrangement was adopted, the centre pair of turrets were spaced wider apart. A further change in the arrangement of turrets was adopted for the first time in these

battleships, where the after-pair were disposed at different deck levels to enable X turret to fire over Y. This arrangement, which now became the standard practice, while it introduced some difficulty in providing for stability, was economical of space, and simplified many of the gunnery problems connected with the ship; it gave, moreover, a higher gun platform for some of the armament.

While the offensive qualities of the battleships had continued to increase in successive types, the need for improved defence, particularly against mine and torpedo attack, had not been overlooked.

The adoption of protective bulkheads against under-water attack as carried out in the "Dreadnought" and subsequent capital ships was the outcome of the naval engagements of the Russo-Japanese war. The Russian battleship "Tsarevitch," in particular, had been fitted with a protective deck which, instead of being continued to the side of the ship, was turned down in wake of the magazines, forming a heavy longitudinal bulkhead situated some distance from the ship's side. This protection had enabled her to resist successfully the explosion of several torpedoes. It was decided to incorporate in the "Dreadnought" design some under-water protection to the vitals. Within the limits of displacement available it was not possible to do more than protect the magazines and shell-rooms. These were given 2-in. protective bulkhead plating at the three centre-line turrets, and 4-in. protective bulkhead plating outside the two beam turrets, as the latter, being situated nearer the sides of the vessel, were consequently much more vulnerable.

In the subsequent "Bellerophon" and "St. Vincent" classes this side protection was developed in the form of a continuous longitudinal protective bulkhead terminated by protective transverse bulkheads completely boxing in the magazines and shell-rooms of the five turrets and the main machinery spaces enclosed between them. The thickness varies from 1½ in. to 3 in. according to the distance of the bulkhead from the outer shell of the ship. In a vertical direction the bulkhead ran from the outer bottom to just above the lower edge of the side armour. In the "Hercules" and "Orion" classes there was a reversion to the original "Dreadnought" system of isolated protection to the various compartments immediately below each of the three groups of turrets, the remainder of the ship's hull below water-line being unprotected. In the "King George V." and "Iron Duke" classes the under-water protection was extended by joining up the portions between the two foremost turrets to those below the centre turret, so that only the ends of the ship and something less than the middle third remained unprotected. Concurrently with the battleships this form of protection was also fitted in the battle cruisers, but limited to the magazines and shell-rooms.

Finally, in the "Queen Elizabeth" (the torpedo menace having increased) the continuous longitudinal protective bulkheads were once more incorporated, and with the transverse protective bulkheads at each end, girdling the ship throughout nearly her entire length, so that not only shell-rooms and magazines, but engine and boiler-rooms had the protection of a bulkhead 2 in. thick some 70 ft. from the ship's side, with the addition of another longitudinal bulkhead of 17 lbs. plating placed (at a distance of 7 ft. amidships and at varying distances at the ends) on the inner side of the protective bulkhead, further minimizing the risk of damage to the vitals of the ship from the effects of an explosion.

The arrangement of the protective bulkheads in the "Royal Sovereign" class generally followed that of "Queen Elizabeth," but their thickness was 1½ inches.

The efficiency of this system of protection, which a series of experiments had established, was demonstrated at Jutland, and it was further improved upon by the later forms of bulge protection.

The construction of British battle cruisers had proceeded concurrently with that of the battleships, although in smaller numbers. The demands made upon the engineering staff to provide for the large increases of power already referred to involved many difficult problems, but the "Indefatigable" was nevertheless completed (in 1911) within two years of laying down, and the later ships, "Lion," "Princess Royal," "Queen Mary," and "Tiger," followed on in succeeding years, each marking some advance in power and speed. Two other battle cruisers of the "Indefatigable" type, viz. "New Zealand" and "Australia," built for the Dominions from whence they took their names, had also been completed and were available for reinforcing the battle cruiser squadrons.

When the World War broke out in Aug. 1914 there were, moreover, four capital ships building in England for foreign Powers—two for Turkey and two for the Chilean Government. The two Turkish ships had just been completed and commissioned, one at Armstrong's and the other at Vickers', and were on the eve of sailing when war was declared. As both vessels were subject to preemption in the event of war, the Government promptly took them over and added them to the British fleet under the names of "Agincourt" and "Erin" respectively.

Of the two Chilean ships building in England at Armstrong's, the "Almirante Latorre" (10 14-in. guns and 16 6-in. guns) was the further advanced, and she was taken over and renamed "Canada." She was completed in Sept. 1915. The "Almirante Cochrane" was taken over in 1918 for conversion into an aircraft carrier, being renamed "Eagle."

There were thus at the outbreak of war the following completed capital ships on the offensive British list:—

"Erin" and "Agincourt" (purchased)	2
"Iron Duke" class	2 <sup>1</sup>
"King George V." class	4
"Orion" class	4
"Colossus" class	2
"Neptune"	1
"St. Vincent" class	3
"Bellerophon" class	3
"Dreadnought"	1

Battleships . . . . . 22

"Queen Mary"	1 <sup>1</sup>
"Lion" and "Princess Royal"	2
"Indefatigable," "Australia," and "New Zealand"	3
"Invincible," "Inflexible," "Indomitable"	3

Battle cruisers . . . . . 9

The total armament comprised in the above completed ships was as follows: 134 13.5-in. guns; 162 12-in.; 60 6-in.; 360 4-in., of which 18 were anti-aircraft; 62 3-in. and 12-pdr., of which 38 were anti-aircraft; 46 6-pdr. and 3-pounder.

Of the older battleships, from the "Majestic" class (1895) onwards, the British navy possessed:—

"Lord Nelson" class	2
"King Edward VII." class	8
"Swiftsure" class	2
"Duncan" class	5
"Formidable" class	2
"Canopus" class	6
"Majestic" class	9

These older ships, whose speeds ranged from 17 knots to 19½ knots, comprised a total armament of 152 12-in.; 8 10-in.; 52 9.2-in.; 28 7.5-in.; 416 6-in.; 28 14-pdr. and 530 12-pounder. They were, of course, not in a position to meet modern "Dreadnoughts" on equal terms, but they compared favourably in offensive and defensive qualities with contemporary German warships, while being numerically in considerable superiority. They all rendered useful service during the war.

The old "Revenge," completed in 1894 (renamed "Redoubtable" in 1914), the last available vessel of the old "Royal Sovereign" class, was commissioned and rendered useful service in the Belgian coast bombardments of 1914 and 1915.

In addition to the "Tiger" and the two remaining ships of the "Iron Duke" class which were approaching completion, there were five "Queen Elizabeths" in a more or less advanced state of construction, and five "Royal Sovereigns" laid down eight to ten months previously. The "Queen Elizabeth," being the farthest advanced, was pushed on with all possible speed, and by Jan. 1915 she was sufficiently completed to be commissioned and sent out to the Mediterranean, where she took part in the bombardment of the Dardanelles forts.

With regard to the design of British capital ships in the past, a most serious limitation had been the restricted width of the graving-docks in Great Britain. This involved keeping the extreme beam of the ships within about 90 feet. Had wider docks been available, thus making it possible to have had a greater beam, the designs on the same length and draught could have embodied more fighting qualities, such as armour, armament, greater stability in case of damage, and improved under-water protection. This condition subsisted until the completion of the two big floating docks for Portsmouth<sup>4</sup> and the Medway, the two locks at Portsmouth, and the large graving-docks at Rosyth; but the shortage of wide docks was a serious handicap during the war, and it was necessary to make use of the Gladstone Dock at Liverpool and the dock at Avonmouth.

<sup>1</sup> Two more nearly complete.

<sup>2</sup> One more ("Tiger") nearly complete.

<sup>3</sup> The anti-aircraft armament was not provided until after the outbreak of war, when such provision became necessary.

<sup>4</sup> Portsmouth floating dock was transferred to Invergordon in 1914, and the Medway Lock to the Tyne in 1915.

Even in 1921 there was a great need for more British floating docks of the largest description. This was more especially apparent on the Clyde, where there was no dock, either floating or graving, which could take capital ships.

The German ships were not handicapped in this way, and most of their later capital ships had widths of between 90 and 100 ft., which enabled them to carry more armour, and as far as it is possible to judge, they stood a good deal of battering without showing any lack of stability, while they proved to be good gun platforms, at any rate for work in the North Sea.

Immediately after war was declared great pressure was exercised to complete the ships then building for the British navy, and to order such other vessels as could be designed and finished in the shortest possible time. The view held in the early days that the war would only last a year necessarily coloured all that was done in the way of naval design and construction. Generally speaking, therefore, the construction of new battleships was ruled out. With the acquisition of the "Agincourt," "Erin" and "Canada," which were building in England for foreign Governments in private yards, and in view of the certain early completion of the remaining two vessels of the "Iron Duke" class, shortly to be followed by the vessels of the "Queen Elizabeth" class, Great Britain had a great preponderance of heavier capital ships, or Dreadnoughts, over the enemy; and as this class of ship takes longer to design and construct than any other, it was obviously a prudent course to concentrate on such types as were specially needed and could be built more quickly.

It should also be remembered that the menace of the submarine, which was from the first beginning to loom as a vital factor in the war, pointed in the direction of large numbers of patrol boats, torpedo-boat destroyers, and smaller types of vessels to deal with this menace. No time, therefore, was lost in placing orders for additional British destroyers, submarines, light cruisers, sloops, mine-sweepers, patrol boats, etc.: and it very soon became clear that the Royal dockyards and the regular warship-building contractors would not be able to cope with the mass of new construction that was required. Accordingly, orders for many of the last-named classes were placed with builders who had hitherto only been accustomed to mercantile work. With the arrangements that were made, however, for superintending and overseeing the work by the Admiralty, with the assistance of the registration societies—Lloyd's and the British Corporation—

very little difficulty was experienced in getting the work satisfactorily carried out by the firms new to this class of shipbuilding, and success attended the arrangements made.

Table II. gives the number and tonnage of vessels added to the British navy during the war. The total number (including other classes besides those in the table) was 1,513, of approximately 2,356,000 tons displacement.

TABLE II.—British Warships Completed and Lost Between Aug. 4 1914 and Nov. 11 1918.

	Completions		Losses	
	No.	Approx. Displacement	No.	Approx. Displacement
Battleships	15	395,000	13	201,000
Battle cruisers	3	81,500	3	63,000
Cruisers	3	56,500	13	158,500
Light cruisers	36	143,000	12	46,000
Monitors	40	126,000	6	14,000
Aircraft-carriers	8	67,500	3	27,500
Flotilla leaders	28	45,500	3	5,000
Torpedo-boat destroyers	255	273,000	64	52,000
Submarines	146	151,500	54	43,500
P. and P. C. boats	63	40,000	2	1,000
Sloops	124	155,500	18	22,500
Paddle mine-sweepers	34	27,500		
Twin screw mine-sweepers	55	43,000		
Patrol gunboats	30	27,000		
Oilers and petrol carriers	67	436,000		
Whalers, trawlers and drifters	382	173,500		

**Battleships.**—To take ships added to the British navy during the war in the proper order, it is necessary to begin with battleships of the "Iron Duke" class. The particulars of Dreadnoughts built after the "Hercules" are given in Table III.

The "Iron Duke" class (see fig. 1), of which there were four, followed the "King George V." class, both in sequence of time and in general characteristics. The same main armament, similarly arranged, with the five turrets all on the centre line of the ship, was adhered to, the chief difference in the "Iron Dukes" being that instead of the 4-in. guns forming the secondary armament, a battery of 12 6-in. guns, protected by 6-in. armour was finally decided upon. The protection also was somewhat increased over that of the "King George V.," involving an increase in dimensions over any previous British battleships. Two of the class were laid down in Jan. 1912 and two in May, the four vessels being completed in March, June, Oct. and Nov. 1914, so that two were ready just

TABLE III.—Particulars of British Battleships.

Vessel	Date of Launch	Length between perpendiculars (length over all)	Breadth	Mean Draught	Load Displacement Tons	Speed: Knots	Horse Power	Armament	Thickest side of Armour
"Orion"	1910	545 ft. (581 ft.)	88 ft. 6 in.	27 ft. 6 in.	22,500	21	27,000	10—13.5-in.	12 in.
"Thunderer"	1911							16—4-in.	
"Conqueror"	1911							3—21-in. T. T.	
"Monarch"	1911								
"King George V."	1911	555 ft. (597 ft. 6 in.)	89 ft.	27 ft. 6 in.	23,000	21	27,000	10—13.5-in.	12 in.

"Resolution"	1915	632 ft. (671 ft. 6 in.)	89 ft.	27 ft.	27,500	22	34,000	14—12-in. 20—6-in.	9 in.
"Ramillies"	1916							3—21-in. T. T.	
"Agincourt"	1913							10—13.5-in. 16—6-in.	
"Erin"	1913							4—21-in. T. T.	
"Canada"	1913	625 ft. (661 ft.)	92 ft.	28 ft. 6 in.	28,000	22½	37,000	10—14-in. 16—6-in.	9 in.

before, and two months after, the declaration of war. Four torpedoes were carried in lieu of three in the previous ships, and after the battle of Jutland a considerable amount of additional protection was added over the magazines—a course which was practically adopted in all British ships at that time as a precautionary measure. Only in one case was any portion of a shell found to have penetrated below the protective deck; but with the ever-increasing range at which actions were fought, and the increasing penetration of improved shell, the danger of the deck being inadequately protected was a serious consideration. The first inadequate penetration was in the *Iron Duke*, when the fleet flagship during the whole time of Adml. Jellicoe's appointment as commander-in-chief, and she was in action at Jutland with her sister ships.

The "Marlbrough," it should be specially noted, was the only British battleship of the post-"Dreadnought" type struck by a torpedo during the whole war, and the value of the longitudinal protective bulkheads and of the subdivision and arrangements adopted is clearly shown as the ship was able to remain in the line, no vital damage being done. She was afterwards safely docked in the Tyne and repaired. This is especially interesting, as many of the older ships, some with centre-line bulkheads and with other arrangements not so good for dealing with under-water damage, were sunk in the Dardanelles and elsewhere by enemy torpedoes.

The next typographic note is the "Queen Elizabeth" class of the 1912-3 programme (see figs. 2 and 3). Three of these vessels, after taking a little more than two years to build, were completed in Jan., March and Oct. 1915. The other two were completed in Feb. 1916. A very considerable departure was made in the "Queen Elizabeth" from any previous "Dreadnoughts", the 15-in. gun taking the place of the 13.5-in., and the designed speed being increased by 4 knots over previous "Dreadnoughts", whilst the displacement was similar to that of the "Iron Dukes", consisting of 6-in. guns, and every increase of speed involved more than doubling the H.P. of the "Iron Duke" to give the 25 knots desired, and the great increase in the weight of the 15-in. guns and mountings over the 13.5-in. meant accepting only four turrets with eight 15-in. guns, as against five turrets with 10 13.5-in. guns in the previous ships, and even so the armament was considerably heavier. The further great departure from previous practice in battleships was the adoption of oil only as the fuel. This necessitated special arrangements of the oil bunkers, many of which were 30 ft. high, and the superstructure was accordingly increased in head of oil. The armour and protection were fully maintained as compared with previous ships, but all these additions involved increasing the displacement to 27,500 tons.

In the battle of Jutland the Fifth Battle Squadron, consisting of four vessels of this class, were heavily engaged for several hours, and although they inflicted and sustained heavy punishment, especially in the case of "Warspite," all the vessels gave a splendid account of themselves and were not seriously damaged or put out of action. After the battle of Jutland additional protection was added to the magazines. The oil fuel proved a complete success in

the stress of war conditions, it being found easier to keep up a high sustained speed, with the smaller complement carried.

It should be noted that Sir Philip Watts was responsible as Director of Naval Construction for the design of the "Iron Duke" and "Queen Elizabeth" classes, thus completing a series of 27 battleships of the "Dreadnought" type designed and built during his tenure of office at the Admiralty—in addition to the large number of battle cruisers, light cruisers, destroyers and other vessels built during that period—truly a great record.

Following the "Queen Elizabeths" came the "Royal Sovereign" class of the 1913-4 programme (see figs. 4 and 5). These were the first capital ships built by the Admiralty for Sir Eustace d'Eyncourt's designs, he having succeeded Sir P. Watts in Aug. 1912. These vessels were to have the same armament as the "Queen Elizabeth," but as there was some question about the supply of oil fuel when the design was discussed, it was decided to revert to coal, and also to accept the slower speed of 21 knots, which would make them more homogeneous with other "Dreadnoughts." Subsequently, when the vessels were in process of construction and the great advantages of the use of oil fuel with other types of warships became apparent, it was decided to change from coal to oil, so enabling increased power, giving a speed of about 23 knots, to be obtained. When fully laden with about 4,000 tons of oil, the "Revenge" attained 22 knots, which was equal to about 23 knots in the designed load condition. A somewhat different disposition of deck and side armour was also adopted by which the thick protective deck at the

centre of the ship was brought up to the level of the main deck; this portion of the protective deck being thus well above the level of the deep load line, and giving more protected freeboard in the damaged condition than on any of our earlier battleships. This was an important feature, as a somewhat reduced metacentric height was decided upon for these ships with a view to making them steadier gun-platforms than some of the ships with more initial stability. The vessels were provided with good under-water protection, which was later reinforced by adding outside bulge protection. This was done to "Ramilles" before her launch and to the other vessels of the class before their commissioning some time later. The addition of "bulges" was suggested first by Sir E. d'Encourt originally for the "Edgar" class, for which this form of protection was added in 1914 after experiments had been made. The results proved the efficiency of the bulges.

The three battleships taken over by Great Britain from foreign Governments were of different types. H.M.S. "Agincourt" (see fig. 6) was commenced in Sept. 1911 for the Brazilian Government, from designs got out under Mr. Perrett at Elswick, but modified by Sir E. d'Encourt in Rio Janeiro, where he was then representing the Armstrong firm, before his appointment at the Admiralty. The Brazilian authorities, after much discussion, decided upon 14 12-in. guns, twin-mounted in seven turrets. This involved a ship with a length of 632 ft. between perpendiculars and 670 ft. over all. The main armour was somewhat lighter than that of British "Dreadnoughts" and in other respects, such as fuelling facilities, the ship hardly came up to the British standard. However, she was well reported on, and the 14 big guns were liked by the gunnery officers, who preferred a large number of guns for their salvoes. Certain alterations had to be made to fit her for the British service, but in the main she was left as designed.

It should be mentioned that in 1914 the "Agincourt" was transferred by Brazil to Turkey and she was on the point of leaving the Tyne for Constantinople when, on the declaration of war, she was taken over by the British Government.

The design of the "Erin" was settled by three firms, Armstrong's, Vickers and John Brown, in consultation with the Turkish authorities. The vessel, for whom the vessel was built, being commenced in 1911. In general characteristics she more nearly followed the "King George V" class than any other British ship, except that the secondary armament consisted of 6-in. guns, as in the "Iron Duke" class. This vessel also was taken over by the British Government in Aug. 1914, and certain modifications made to fit her for the British service. In respect of quantity of fuel carried, the "Erin" was below the standard adopted for vessels designed for the British navy.

The third ship taken over from a foreign Government was ordered and commenced in 1911 at Elswick from designs prepared at Elswick by Mr. Perrett for the Chilean Government. There were two ships of the class, the "Almirante Latorre" (which became H.M.S. "Canada"), and the sister ship the "Almirante Cochrane" (now H.M.S. "Eagle"). The "Canada" had 10 14-in. guns, twin-mounted, in the centre line, and was originally designed to have 22 4.7-in. as the secondary battery, but this was subsequently altered to 16 6-in. guns. The protection again was somewhat lighter than that of the British "Dreadnoughts," but the speed was rather higher, viz. 22½ knots, and as a matter of fact this speed was considerably exceeded on trial. The ship was taken over by the British Admiralty in Sept. 1914, and completed, after certain necessary modifications, a year later. Her fuel consisted of coal, with the addition of a certain amount of oil, as in most British battleships. In 1920 the "Canada" was returned to the Chilean Government under her original name.

The sister ship, "Almirante Cochrane," remained in an uncompleted condition on the stocks at Elswick till early in 1918, when she was taken over by the British Government and rearranged as an aircraft-carrying ship. She was renamed H.M.S. "Eagle," and as a compliment to the U.S. navy, she was, at the request of the Admiralty, launched by Mrs. Page, the wife of the then American Ambassador to Great Britain.

**Battle Cruisers.**—As regards the British battle cruisers later than the "Princess Royal," particulars are given in Table IV.

The "Tiger" was included in the 1911-2 programme and followed on the "Queen Mary," the general features of the two ships being much alike, the chief differences being that the secondary armament of "Tiger" is 12 6-in. guns in lieu of 16 4-in. in "Queen Mary," and "Tiger" has two submerged torpedo-rooms, whereas "Queen Mary" had only one.

The "Tiger" was laid down at Clydebank on June 12 1912, and completed in Oct. 1914. In common with so many ships completed during the war, the early commissioning and joining of the fleet was so imperative that no exhaustive trials in deep water were carried out, but the runs made on the Polperro course showed that the designed power of 108,000 S.H.P. could be obtained with little difficulty, corresponding to a speed of 30 knots. In the early stages of the design the oil-fuel capacity was very largely increased from 1,000 tons originally intended to a maximum oil stowage of 3,480 tons, in addition to the 3,320 tons of coal.

pulse" as battleships and to alter the design completely into that of very fast battle cruisers.

Instructions to redesign these ships were given about Christmas 1914. The new design had to give a speed of 32 knots, with the largest number of big guns possible for such a vessel, and with protection similar to that of the "Invincible" class. A modified form of bulge was adopted in these ships to give additional under-water protection against torpedo attack. After the war further additions were made to the bulge protection and to the armour.

Fig. 9.

The general outline design was completed and approved in ten days, and 6 15-in. guns adopted as the main armament, the secondary armament consisting of 17 4-in. guns, of which 15 were mounted in five specially designed triple-gun mountings. It was necessary that the ships should be completed at the earliest possible date, and the "Tiger's" machinery was repeated with some additional boilers, with oil as the fuel, thus increasing the power to 120,000, which, with the extra length given to the ship, made it possible to obtain the desired speed of 32 knots.

Lord Fisher also insisted that the ships must be completed within 15 months—an abnormally short time for an entirely new design—this period of completion was not realized, although not greatly exceeded. By Jan. 21 1915 the two firms entrusted with the orders, viz. Messrs. John Brown and Fairfield, were supplied with sufficient information to enable them to proceed with the structure, and both keels were laid on Jan. 25, which was Lord Fisher's birthday. All the drawings and specifications were completed by April and the design finally approved in that month.

The arrangement of the whole ship, showing the protection, is given in fig. 7, the plating over the magazines having been considerably increased as a result of the Jutland fight.

"Repulse" was launched in Jan. 1916, less than a year from the laying down, and "Renown" was launched three months later. "Repulse" went through her commissioning trials early in Aug., and "Renown" followed one month later and was completed in September. The speed of "Repulse" on trial was over 31½ knots in the deep condition, and the "Renown" obtained 32.6 knots mean speed in the normal condition.

The construction of these vessels in a little over one and a half years from the first order to get out the design constitutes a record in design and construction of two such important vessels, and reflected great credit, not only upon the Royal Corps of Naval Constructors, but also upon the contractors and all concerned in the construction and completion of the vessels. In fact, the Admiralty conveyed their appreciation of this to Sir E. d'Eyncourt, the Director of Naval Construction, in a letter dated Sept. 1916.

The battle cruiser H.M.S. "Hood" (see figs. 9 and 10), the latest addition up to 1921 to the capital ships of the British Fleet, was designed early in 1916, and had only just been ordered from Messrs. J. Brown & Co. when the battle of Jutland took place. This great event naturally led to a revision of the design and in view of the damage which was then done to British battle cruisers and also to

Fig. 7.

At the commencement of the war two additional battleships of slightly modified Royal Sovereign type, viz. the "Renown" and "Repulse" (see figs. 7 and 8), had been laid down, but in view of the long time it would take to complete these ships, the construction was not pressed forward. Immediately after the battle of the Falkland Is., in which the British battle cruisers "Invincible" and "Inflexible," in company with other smaller cruisers, annihilated Von Spee's fleet, the value of the battle cruiser type became very apparent, and on the initiative of Lord Fisher, then First Sea Lord, it was decided to stop the construction of "Renown" and "Re-

the German ships of similar type, it was deemed advisable to increase the armour protection, if possible. As the result of very extensive investigations, it was found possible, by accepting a deeper draught and a slightly reduced speed, to add very considerably to the protection of the vessel as already designed, without otherwise seriously affecting the design of the ship as a whole. The alterations were of a very radical character, the armour belt being increased from 8 to 12 in. and the barbettes from 9 to 12 in.; and certain increases were also made in the deck protection. At the same time the eight 15-in. gun mountings had their design modified to admit of an elevation of 30 degrees, and certain other modifications were made, both in the torpedo armament and also in the arrangements for preventing the flash penetrating to the magazines—a form of protection which was elaborated for all British ships at this time. All these increases involved an additional weight of nearly 5,000 tons, the legend displacement of the "Hood" becoming finally 41,200 tons when carrying 1,200 tons of fuel; the ship then having a draught of 28½ ft., and a draught of 31½ ft. with full fuel load, viz., 4,000 tons.

The original length and beam of the ship were maintained as before. Some extra plating had to be provided on the decks for strength purposes, but the under-water protection against torpedoes was retained as in the original design. With the modifications made, the "Hood" when completed was by far the most up-to-date capital ship in existence.

The changes in the design and other circumstances militated against the quick construction of the ship, and it was about four years from the approval of the original design in April 1916 to the time of her completion, this being about double the time taken to build recent British capital ships, and nearly three times that taken to build the "Repulse" and "Renown." The modifications were, however, quite justified by the circumstances, and they made the ship a much more powerfully protected one, whilst increasing her displacement, and consequently the weight of material to be worked, to about 50% more than that of "Repulse" and "Renown."

The main machinery of the "Hood," consisting of geared turbines to develop 144,000 H.P., has the largest power which has ever been put through gearing, namely, 36,000 H.P. on each of the four shafts. The machinery is placed in three engine-rooms, of which the forward one contains two independent sets for the outer shafts; the middle and after engine-rooms contain one independent set for each of the inner shafts. This power, which was designed to give 32 knots for the earlier design of 36,300 tons displacement, was expected to give at least 31 knots in deep water with 210 revolutions of the propellers, at a displacement of 41,200 tons for the "Hood" as built. The 24 boilers represented the small-tube type with forced draught, arranged in four boiler-rooms. Such boilers were first adopted for large vessels in the "Courageous" class. Oil is the fuel used in "Hood." On trials on the measured mile the "Hood" obtained a speed of 32.07 knots with 151,000 S.H.P. at 42,200 tons displacement, and 31.9 knots with 150,000 S.H.P. at 44,600 tons displacement.

It will be seen from the plan (fig. 9) that the main armament of eight 15-in. guns was mounted, as in recent British battleships of the "Queen Elizabeth" and "Royal Sovereign" classes, in four turrets, all on the centre line, with very large arcs of training, the forward ones training to 60° abaft the beam, and the after ones to 60° before the beam. The anti-torpedo-boat destroyer armament consists of twelve 5½-in. guns arranged on the forecastle deck and shelter deck. There are also four 4-in. anti-aircraft guns on the shelter deck aft. There are two 21-in. submerged torpedo tubes, each in a separate compartment forward, and four 21-in. above-water torpedo tubes between the upper and forecastle decks; these above-water tubes being a further addition since the original design was made. The distribution of armour is also shown. The 12-in. belt had a length of 562 ft. and a depth of 9 ft. 6 inches. Above the main belt was a strake of 7-in. armour to the height of the upper deck, and above that again there was 5-in. armour between the upper and forecastle decks. The side armour all sloped outward from below, the shell being thus unable to hit the armour normally, so that the virtual thicknesses were somewhat greater. There was thick plating behind all the armour, varying from 2 in. over the greater portion to 1½ in. and 1 in. elsewhere. The torpedo protection consisted of the bulge arrangement, with an outer compartment of air and an inner one specially strengthened with the necessary separating bulkheads, etc. This protection extended throughout the whole length of the machinery spaces and magazines, and it has been proved that it renders the ship as safe against attack from torpedoes under water as she is against gun attack above water. The oil fuel tanks are arranged along the sides, thus giving additional protection. The "Hood" was successfully launched in Aug. 1918 at Clydebank, the ceremony being performed by Lady Hood, widow of Adm. Hood, who lost his life whilst gallantly leading into action the Third Battle-Cruiser Squadron at Jutland. The launching weight was about 22,000 tons. As the other three ships of the class which were commenced had none of them reached the launching stage at the time of the Armistice, it was subsequently decided not to proceed with them, in view of the international conditions, and the "Howe," "Rodney" and "Anson" were accordingly scrapped.

As regards the general design of the ship, the "Hood" may be

cited as an example of what can be achieved by going to a large size. Her design embodies the armour and armour protection of a first-class battleship, including also good under-water protection against torpedoes, and at the same time gives the speed of the fastest battle cruisers. This involved great length and displacement. The under-water bulge protection, which has entirely superseded the provision of torpedo netting, is additional to anything provided in pre-war "Dreadnoughts."

In connexion with the size of the "Hood" and general considerations of design, it is interesting to note the chief characteristics of the "Queen Elizabeth" and "Renown." The "Queen Elizabeth" is a well-armoured ship of about 28,000 tons, with eight 15-in. guns and speed of 25 knots, while "Renown," of slightly less displacement, viz. 27,000 tons, though of greater length, is a vessel with 7 knots more speed than "Queen Elizabeth," but with only six 15-in. guns against eight, and approximately about half the armour protection provided in the "Queen Elizabeth." The "Hood" has the same armament, viz. eight 15-in. guns, as the "Queen Elizabeth," armour protection fully equal to and, in fact, rather heavier in the aggregate than that of the "Queen Elizabeth," 7 knots more speed than the "Queen Elizabeth," which makes the speed about equal to that of "Renown," and in addition complete protection against torpedo attack.

FIG. 11.

**Large Light Cruisers.**—Early in 1915, as sanction was not given by the British Government for building more capital ships taking two years or longer to complete, while additional light cruisers had been already approved of, it was decided to build "Courageous" and "Glorious" (figs. 11 and 12) on the lines of very large light cruisers mounting a few guns of heaviest calibre, so as to be able to annihilate any enemy light cruisers or raiders. They were to have light protection, similar to British light cruisers, and a speed of not less than 32 knots, the draught being restricted to about 22 ft., or about 5 ft. less than any existing battleships or battle cruisers carrying such heavy guns, the main armament of four 15-in. guns in two turrets, one forward and one aft, making them a match for any raider or light cruiser that might be encountered. At this time it should also be remembered that the armaments of ships, especially as regards heavy guns, had to be regulated by the guns and gun mountings which would be available or could be manufactured in a short time, and this condition applied to the 15-in. mountings which were adopted for these ships. The secondary armament consisted of eighteen 4-in. guns in six triple mountings, similar to the triple mountings of the "Renown" and "Repulse." The side armour consisted of 2-in. protective plating added to the 1-in. shell plating, and a thin protective deck was worked all fore and aft, but this was considerably thickened over the magazines after Jutland. A modified "bulge" was arranged for, as in "Renown" and "Repulse."

The machinery adopted for these ships was of the type fitted in the light cruiser "Champion." It consisted of a 4-shaft arrangement of geared turbines, the power being transmitted to the propeller shafts by double helical gearing. The eighteen boilers of Yarrow small-tube type were also similar to those of the light cruisers, and with all-oil firing a power of 90,000 S.H.P. at about 340 revolutions of propellers was aimed at. Such trials as it was possible to make showed that 32 knots could easily be obtained at the designed displacement, and on service this was actually exceeded.

It was intended that these vessels should be built in a year, or as near that as possible, but this was not realized, and the ships were both commissioned in Oct. 1916.

The "Furious" (see fig. 13), was similar to, but a modification of, the "Courageous" and "Glorious," having about the same length and the same machinery, but the form of midship section was somewhat different, having a more pronounced bulge and a simpler form of main framing and structure of the hull. The armament also was different; each turret, instead of having two 15-in. guns, was arranged to carry one big gun of 18-in. bore.

Early in the spring of 1917 the necessity for having fast aeroplane-carriers became very obvious, and it was approved to fit "Furious" for this purpose. This entailed the removal of the fore turret and making other considerable alterations. A large hangar was built on the forecastle deck, and a flying-off platform 160 ft. long was arranged on the roof of the hangar, which was designed to house about 10 machines. Later it was decided to remove the after-turret as well, and a flying-on deck 300 ft. long, extending from the funnel

aft, was constructed. The secondary armament, which had consisted originally of 11 5½-in. guns, was retained, with the exception of one gun; the remaining 10 guns being rearranged. Four sets of triple 21-in. torpedo tubes were fitted on the upper deck aft, and one pair each side on the upper deck forward.

After these alterations were completed, the ship was tried and commissioned in July 1917, a speed of 31½ knots being obtained with 94,000 S.H.P. at 330 revolutions. From the speed point of view the great advantage of size and length is clearly shown in these ships compared to T.B.D.s, since with about three times the H.P. of a destroyer it is possible to drive a ship of nearly 20 times the displacement at the same speed. This in smooth water; in anything of a head sea the T.B.D.s are left behind altogether by the great ships (see Table V.).

**Light Cruisers.**—Following upon the previous light cruisers of the town classes, a very important departure was made in the light cruiser design in the programme 1912-3, when the "Arethusa" class (see fig. 14) was designed by Sir Philip Watts. The importance attached to speed was specially brought out in this design, and it was decided to install very powerful machinery of 40,000 S.H.P. and this could only be achieved by adopting engines and boilers closely approximating to those hitherto used only for destroyers.

In conjunction with high speed a good armament was provided, consisting of two 6-in. and six 4-in. guns, though in the original design the armament consisted entirely of 4-in. guns. The ship's sides up to the level of the upper deck were protected by a high tensile plating varying from 2-in. to 1½-in. and 1-in. in addition to the 1-in. shell plating. This arrangement of plating also greatly added to the strength and stiffness of the ship. Further particulars of the class are given in Table V.

The "Arethusa" and other light cruisers were in the action off Heligoland on Aug. 28 1914.

In the 1913-4 programme the "Calliope" class, slightly larger vessels than the "Arethusas," but with the same power, were decided upon, the designs being made by Sir E. d'Eyncourt. After considerable discussion regarding the merits of mixed or homogeneous armament, it was decided to give these vessels two 6-in. guns, both on the centre line placed aft, and eight 4-in. guns. The protection consisted, as in the previous design, of a belt with a total thickness of approximately 3 inches. Most of this class had practically the same machinery as the "Arethusa," but Parsons geared turbines were installed in two of them, the "Calliope" having four shafts and the "Champion" two shafts. This was at the time a very important experiment, the putting of 20,000 H.P. through gearing being a very bold departure from anything which had been hitherto contemplated. The final results obtained with "Champion" were, however, excellent, and she obtained a speed of 29½ knots with 337 revolutions and about 41,000 S.H.P., this speed being slightly in excess of any of the other vessels of the class at corresponding displacement.

The "C" class are the first ships, other than battleships, to have superposed guns on the middle line, a sort of spoon-shaped bulwark being fitted to protect the crew of the lower from the blast of the upper gun firing over them.

For the subsequent vessels of the "C" class reference should be made to the tables, which show a gradual growth in size and power of armament; "Ceres" class (fig. 14) finally having a length of 425 ft. and a beam of 43 ft. 6 in., and a normal displacement of about 4,200 tons. These vessels carried five 6-in. guns, all on the centre line.

FIG. 15.

The next class were the "D's" (figs. 15 and 16), the general arrangement and protection of which followed that of the "Ceres," except that six 6-in. guns were carried on the centre line instead of five. The power was only slightly increased in these ships over the previous classes, but the revolutions were reduced to 275, all these later classes having the twin-screw geared arrangement, and although the displacement of the "D's" increased to 4,650 tons, the additional length and the reduction of revolutions enabled the speed of close upon 30 knots of the whole class of light cruisers "C's" and "D's" to be maintained.

In addition to these light cruisers, which were all to Admiralty design, two vessels—the "Birkenhead" and "Chester"—built at Messrs. Cammell, Laird's for the Greek Government, were pur-

chased in 1915. These vessels were considerably heavier than the "C" class and more closely resembled the British "Chatham" class. They carried an armament of ten 5½-in. guns. The boilers were modified to burn only oil in the "Chester," instead of coal and oil as in the "Birkenhead," and the resulting increase in power to 31,000 gave the former a speed of 26½ knots.

Designs were prepared in 1915 of the "Raleigh" class (figs. 17 and 18), a considerably heavier type of light cruiser, more especially suited for ocean work in any part of the world. They were to have a speed of 30 knots and a large radius of action. Various armaments were considered, and it was finally decided to adopt an armament of seven 7½-in. guns with twelve 3-in. (four being on high-angle mountings). Five of the big guns were placed on the centre line,

FIG. 17.

and the other two were on the broadsides amidships. The bow and stern guns were superposed, thus giving a fire of four guns, both ahead and astern, and six guns on either broadside. These ships were originally designed to burn oil and coal, but the coal-burning boilers were subsequently altered in three ships of the class to burn a larger amount of oil, the original power of 60,000 S.H.P. on a four-shaft geared turbine arrangement being thus considerably increased up to about 70,000 shaft horse power.

These vessels also differed from the light cruisers referred to above in having modified bulges as protection against under-water attack. The protective plating was similar to that of the other light cruisers. One of these ships, the "Cavendish," was altered into an aircraft-carrier, and renamed "Vindictive."

**Monitors** (see Table V.).—The first vessels of this type to be added (or reintroduced) to the British navy were the three E-Brazilian river monitors built by Messrs. Vickers, Ltd., and taken over by the British Government in Aug. 1914, and renamed "Humber," "Mersey" and "Severn." The particulars of these vessels are given in the table, from which it will be seen that the armament consisted of medium-calibre guns, viz. 6-in. and 4-7-inches. These vessels, though designed for river service, did very good work in the war, both on the E-African and Belgian coasts.

The need for vessels of the monitor type mounting heavy guns soon became apparent, and in Nov. 1914 it was decided to prepare designs of monitors of more substantial structure for sea-going service, but of light draught, with good protection and carrying some heavy guns, the light draught combining the advantages of being able to go close inshore and greatly reducing the risk of being struck by a torpedo.

The earliest design was that of the 14-in. gun monitors, four in number, which was commenced in 1914. Four twin-mounted 14-in. guns and mountings were available, and with the very simple form of structure adopted, these vessels were designed and built in six months. They were quickly followed by the 12-in. monitors, which were of similar design but carried pairs of 12-in. guns, taken from older battleships. These vessels were also built in about six months. They all had a complete bulge of a form which was of simple construction, with an air space outboard and a water space between that and the ship proper.

Following on the 12-in. monitors, early in Jan. 1915 two more vessels were ordered, mounting a pair of 15-in. guns. For these ships, internal-combustion engines, which were well under way, but designed for another purpose, were installed. These vessels were named the "Marshal Ney" and "Marshal Soult."

In Sept. 1915 two improved 15-in. monitors were ordered and named the "Erebus" and "Terror" (figs. 19 and 20). These were of finer form, of more horse power and a speed of 14 knots.

Following the earlier 15-in. monitors, some much smaller vessels, each carrying a 9-2-in. gun, were designed, and others again which carried 6-in. guns. A good many of both large and small monitors went out to the Dardanelles in the early part of the war, and did very good work, and for a long time they seemed to bear a charmed life, as they enjoyed complete immunity from torpedo attack. Later, however, the "Erebus" and "Terror" were both torpedoed; the latter received three torpedoes, two hitting forward of the bulge with severe damage resulting; the third, which hit the bulge itself, did very little damage. The former ship was hit full amidships by a distance-controlled boat carrying a very heavy charge, but the bulge gave her complete protection and both ships were quickly repaired. It is interesting to note in this connexion that some of the old

British cruisers of the "Edgar" class, which had had bulges added to them early in the war, were torpedoed in the Mediterranean, but the bulge gave them complete protection. They were taken to port and repaired. In fact, no bulged ship struck by a torpedo was sunk.

On the heavier monitors it may be remarked that of all ships carrying heavy guns these vessels were probably more often in action off the Belgian coast and elsewhere than any of our heavy-gun ships, and they no doubt gave the enemy in occupation of that coast a very anxious time.

*Destroyers and Flotilla Leaders* (Table V.).—With regard to the development of British destroyers and flotilla leaders during the war reference may be made to the tables and plans (figs. 21, 22, 23, and 24). These vessels gradually increased in size and power, and war requirements continually added to the weights which they had to carry, including considerably more fuel, heavier armament both

of guns and torpedoes, depth charges, larger bridges, and other additions. In fact, some of the ships which before the war were 900-ton vessels, exceeded 1,000 tons towards the end. The introduction, however, of the geared turbine added enormously to the efficiency of the machinery and propellers.

During the war nearly 300 T.B.D.'s and flotilla leaders, which are simply a larger form of T.B.D. with improved accommodation, were added to the British fleet, and the whole class of these vessels was called upon to do continuous work often in heavy weather. They came through the ordeal with very few breakdowns of machinery or other parts of the ship, whilst the duties they were called upon to perform in combating the submarines, convoying, etc. were continuous and varied. Numbers of these vessels were built by firms who had never built a warship before, but the work turned out by them fully met the Admiralty requirements.

The flotilla leaders, with a deep load displacement of about 2,000 tons and an armament of five 4-in. or 4-7-in. guns, and with their very high speed, might well be described as fast scouts or third-class cruisers.

**Patrol Boats** (Table V, and fig. 25).—Patrol boats were specially designed to relieve the T.B.D.'s of some of their duties such as patrolling, submarine-hunting and escort work, for which high speed was not a necessity. They had to be as small as possible, consistent with keeping the sea in all weathers, with sufficient speed to run down submarines, besides having shallow draught and all top hamper kept low to prevent their being seen at a distance. Economy of fuel was also an important feature, and it was desirable to have them built of mild steel rather than high-tensile steel, in order to simplify the construction. Some were provided with a special hard steel ram, with which a considerable number of enemy submarines were sunk. The various features were combined in a vessel of something under 600 tons, with geared turbine engines of 3,800 H.P., giving a speed of over 22 knots, with 330 revolutions of the propellers. The boats had large rudder area and were cut up aft, so that they could turn very quickly upon the enemy—a most important feature for ramming purposes. They proved very valuable boats

with somewhat heavier armament than our own ships. The French Government were very satisfied with the vessels.

In addition to this, at a later stage, for sweeping in shallow water, some paddle mine-sweepers were designed at the Admiralty. These were 15-knot boats, with draught just under 6 ft. 9 inches. They did good work, but were of course not such good sea boats as the sloops. As there was some danger of mines getting under the paddles, a further design of twin-screw mine-sweepers was got out. These were vessels of about 800 tons and about 16 knots speed.

**Submarines** (Table V, and figs. 27, 28 and 29).—During the war the design of submarines was enormously developed. A very large number of these vessels were added to the British Fleet. There were some twelve different types, some embodying very special requirements and all being improvements on their predecessors. The Admiralty produced the fastest internal-combustion engined submarine in the "F" class, which attained a speed of over 19 knots. As a still higher speed was wanted for fleet work, the "K" boats were designed with a surface speed of 24 knots. To arrive at this it was necessary to go to steam, and special arrangements had to be made for shutting down watertight the funnels, etc. However, all these difficulties were overcome.

It is an interesting point about these vessels that, besides the steam turbines for full speed on the surface and the electric drive when under water, they were provided with a Diesel engine for use just before diving or immediately after breaking surface, in order to quicken diving or getting away after coming up.

Although the Germans had the advantage of more power per cylinder in their Diesel engines, Great Britain produced submarines, faster and more heavily armed than theirs.

M. I. submarine was a monitor submarine armed with a 12-in. gun; she was an experimental boat, and proved quite successful.

**"China Gunboats."**—For use in Mesopotamia or for river work two classes of so-called "China gunboats" were designed by Messrs. Yarrow. The smaller of these vessels, 120 ft. long and of about 100 tons, were constructed in Great Britain in such a way that the parts could be sent out to Abadan, where they were assembled, and the vessels reerected and completed under the supervision of Admiralty officers. Some of the larger boats 230 ft. long and of 645 tons, were completed in England and went out to Mesopotamia, where all of them were of the greatest service in that campaign. Most useful work was also done by motor launches and many other types.

**Other Auxiliary Craft and Aircraft Carriers.**—The Admiralty was called upon to design many other auxiliary craft—notably some fast Fleet oilers which were able to carry 5,000 tons of oil and had a speed of 15 knots. There were also designed a great number of special smaller craft for all purposes, and a number of merchant ships were taken over and modified to meet diverse requirements.

The most important modifications were those made to vessels taken over and converted into aircraft-carriers, including "Campania," "Ark," "Royal," "Engadine," "Riviera," etc.; the "Furious" was also altered, and the "Cavendish" (now named "Vindictive") was converted into an aircraft-carrier. The "Argus" (fig. 30) was originally built as a passenger mail ship of 20 knots, and was taken over and converted into an aircraft-carrier with complete flush deck, the funnels being carried aft in long horizontal ducts, discharging the smoke astern. The "Eagle" was taken for conversion into a large aircraft-carrier with a somewhat different arrangement, with the funnels and all deck erections included on an "island" on one side of the deck. Aircraft-carrying ships are in fact gradually becoming more important for the Fleet.

Altogether during the four years more than 2,000,000 tons were added to the navy, at a cost between £250,000,000 and £300,000,000 sterling, exclusive of modifications to auxiliaries. Reference to the navy estimates shows that the aggregate sum spent during the four years before the war on new construction amounted to approximately £60,000,000. In fact, during the four years 1915-8, more tonnage was built for the British navy than during the previous 25 years.

## II. NAVIES OF OTHER COUNTRIES

During the period 1910-20 foreign naval construction of all types generally followed the line of British designs, with one or two important exceptions which must not be overlooked.

The most important departure from the British practice was in respect of the number of guns mounted in the barbettes. Triple-gun mountings for the main armament have been adopted by several nations, viz. France, Italy, Austria, Russia and the United States, while in 1914 the French began the construction of quadruple-gun turrets, but neither these turrets nor the ships for which they were intended have been completed.

The British example in regard to the adoption of turbine machinery for propulsion of the first "Dreadnought" battleship and battle cruisers was not followed by the other nations at once. In some cases, for example, Japan and the United States, sister vessels were built, one having turbine engines and the other reciprocating engines. Finally, however, turbine engines were almost universally adopted, while the United States made a fur-

FIG. 19.

on service and did a great deal of work against the submarines in all weathers. They were armed with only one 4-in. gun, mounted in a commanding position on the forward superstructure, one 2-pdr. and two 14-in. torpedo tubes, and later it was arranged to carry depth charges. Their cost was, of course, considerably less than that of a modern destroyer.

Some of these boats were afterwards disguised to look like small mercantile craft—a device which also proved quite successful.

**Sloops and Mine-Sweepers.**—On the outbreak of war it became clear that there would be a great demand for mine-sweeping vessels. A good many coasting and cross-channel steamers were taken up for this purpose, but more were required, and it was decided in Dec. 1914 to build twelve single screw ships (fig. 26) of simple design to this end. With the view of hastening construction, it was decided to adopt mercantile practice as far as possible in both hull and machinery. The vessels, although of very fine form, were built of simple construction and under Lloyd's survey. The boilers were of ordinary Scotch type, and single screw machinery was provided.

Later Vessels have 4-4-7 Guns in lieu of 4-4 Guns

FIG. 21.

In the end nearly 100 of these vessels were built, and the armament, which at first was two 12-pdrs., was subsequently increased to two 4-in. or two 4-7-in. guns. A great many of these vessels were built in about six months from the order, and the first 36 averaged 25 weeks in building. They proved excellent sea boats, and were used not only for mine-sweeping, but also for submarine work and for conveying. At later stages some of these vessels were disguised as ordinary merchant ships. They were economical steamers, and were able to attain a full speed of 17 knots, with a H.P. of about 1,800 to 2,000 in the earlier, which was increased to 2,500 in the later vessels.

Several of the vessels were mined, but although the damage they sustained was very severe, they kept afloat and were repaired.

The Admiralty was asked to design and provide some vessels of this type for the French Government, and eight of these were designed by Sir E. d'Eyncourt and built for that purpose and armed

ther advance by the adoption of the electric drive. The first American battleship in which this was installed was the "New Mexico," and it was arranged for all subsequent vessels to be propelled similarly.

In the adoption of oil only as the fuel the British again took the lead, and up to Aug. 1921 this had only been followed by the United States. The German authorities had considered that their sources of supply were not sufficiently reliable to justify their depending on oil alone.

On the whole, therefore, it may be said that the designs, apart from the above features, of foreign warships did not differ essentially from the British types, as can be seen from the notes and tables which follow.

Of the minor navies, many of which depended on British or other foreign builders for the design and construction of their warships, little need be said, as with the war the development of their navies practically ceased, and some of the most important vessels, such as the battleships building for Chile and Turkey, were taken over for the British navy.

At the Armistice both the German and Austrian navies ceased to exist as factors in the general naval situation, all their principal ships being surrendered to the Allies, the great majority of the vessels being finally destroyed, either being broken up or used as targets, with the exception of a few of the less important units, such as light cruisers and destroyers, which were incorporated in the French and Italian navies.

### Battleships

(1) *United States*.—The first vessels of the "Dreadnought" type constructed for the U. S. navy were the "Michigan" and "South Carolina," launched in 1908. These vessels, carrying only eight 12-in. guns, were of about 2,000 tons less displacement than the "Dreadnought," and 2 knots slower than this vessel. The main armament of the U. S. vessels was disposed, however, in an original manner, constituting a bold departure in that they were all mounted on the centre line of the vessel in two superposed twin-gun turrets forward, and two aft, with large arcs of training on each beam. This arrangement of turrets gave an ahead and astern fire of four guns and a broadside fire of all the eight guns. The water-line armour belt was 11 in. thick with 8 in. above. Cage masts constructed of a large number of steel tubes were fitted in these vessels and such masts have been fitted in all later U. S. capital ships and also in some of the earlier vessels in substitution of their original masts. The "Michigan" and "South Carolina" were propelled by twin screws driven by reciprocating engines, thus differing from the "Dreadnought."

The next battleships built were the "North Dakota" and "Delaware," launched respectively in 1908 and 1909. These vessels were a considerable advance in size over their predecessors, being more than 60 ft. longer, 4,000 tons heavier, and two knots faster, while they carried two additional 12-in. guns. The 10 guns were mounted all on the centre line, the two turrets forward being superposed as in the previous class, while the three turrets aft were arranged so that one could fire over the other two, which were both on the same deck so that one could only fire on either broadside. The arrangement of guns thus increased the broadside fire but left the ahead and astern fire as before. The armour belt consisted of a tier of 11 in. at the water-line, with a tier of 8 in. above. The advance in speed involved an increase of 50% in the H.P. of the engines, viz. from 16,500 to 25,000. Turbines of the Curtis type were installed in the "North Dakota" for the first time in a U. S. capital ship, but the "Delaware" was fitted with reciprocating engines. An important departure in these vessels was the fitting of 14 5-in. guns as secondary armament in a battery amidships, protected by 5-in. armour.

The next pair of battleships, named the "Utah," launched in 1909 and the "Florida," launched in 1910, were enlarged "North Dakotas," but both had Parsons turbine engines of 28,000 shaft horse-power. The tonnage was increased to 21,800 tons on the same draught, and the speed remained practically the same. The length was increased slightly to 521 ft. and the beam to 88 ft. The main armament was the same in number of guns and arrangement of turrets as in the "North Dakota," but the secondary armament was increased to 16 5-in. guns, protected by 5-in. armour. The armour was practically the same as in the previous vessels.

The succeeding pair of battleships, "Arkansas" and "Wyoming," launched in 1911, were characterized by another large increase in dimensions, the length being increased to 562 ft. and the beam to 93 ft., while on the same draught as previous vessels the displacement was 26,000 tons. The engines were Parsons turbines of about 28,000 S.H.P., the speed being about  $\frac{1}{2}$  knot less than the "Utah," of the same power but 4,000 tons less displacement. The greatly increased displacement enabled 12 12-in. guns to be mounted

in six twin-gun turrets arranged all on the centre line in three superposed groups, one group forward, another just abaft of amidships and the remaining group aft. The ahead and astern fire thus remained as in previous vessels at four guns, but all 12 guns could be fired on either broadside. The secondary armament was 16 5-in. guns in a 6-in. armoured battery. The protection was generally similar to the previous vessels, the water-line belt and barbettes armour being 11 in. thick. The turrets and conning tower were of 12-in. armour.

These vessels were the last U. S. battleships mounting 12-in. guns. The example of the British in fitting 13 5-in. guns in the "Orion" class was followed by the adoption of 14 5-in. guns in the next vessels laid down by the United States. These were the "Texas" and "New York," launched in 1912, the dimensions of which were slightly greater than those of the "Arkansas" and the displacement 1,000 tons greater. Ten 14-in. guns constituted the main armament and was mounted in five twin turrets, arranged generally in a similar manner to the British "Orion," four guns firing ahead and astern and all to on either broadside. The secondary armament remained as before, 16 5-in. guns being mounted in an amidships battery protected by 6-in. armour. The water-line belt was 12 in. thick with a 9-in. belt above it, and the protection generally was somewhat greater than that of the previous vessels. An important feature in these vessels was the return to reciprocating engines, which on a power of 27,000 gave the vessels a speed of 21 knots. The reintroduction of this type of engine was made chiefly to obtain greater economy at cruising speeds.

The next pair of battleships, "Nevada" and "Oklahoma," launched in 1914, were of slightly increased length and tonnage. The main armament was the same numerically as the "New York's," but was arranged in four turrets, two containing two guns each and the other two three guns each. The twin-gun turrets were superposed above the triple-gun turrets at each end of the vessels. The secondary armament of the "Nevada" and "Oklahoma" consisted of 12 5-in. guns arranged in an unprotected battery farther forward than in previous vessels. Turbines were again adopted for the propulsion of the "Nevada," but reciprocating engines were fitted in the "Oklahoma." The reduced power of the machinery, viz. 24,800 H.P. of both vessels, resulted in a reduced speed of 20 $\frac{1}{2}$  knots.

The British example of adoption of oil only as the fuel for the "Queen Elizabeth" class was followed by the United States in the "Nevada" and "Oklahoma," the total quantity of fuel arranged for, however, being 2,000 tons, compared with 3,400 tons in "Queen Elizabeth."

The saving in weight resulting from the adoption of triple-gun turrets and oil fuel enabled considerable additions to be made to the armour protection of the "Nevada" and "Oklahoma." The belt amidships was 13 $\frac{1}{2}$  in. thick and extended from 8 $\frac{1}{2}$  ft. below to 9 ft. above the water-line. The conning tower was protected by 16-in. armour, this being also the thickness of the front plates of the twin-gun turrets, those of the triple-gun turrets being of 18-in. armour. The vessels are further distinguished from their predecessors in that only one funnel, instead of two, is fitted. The uptakes are protected by 13 $\frac{1}{2}$ -in. armour.

FIG. 31.

The "Nevada" and "Oklahoma" were succeeded by the "Pennsylvania" and "Arizona" (fig. 31), launched in 1915, in which the dimensions were further increased and the displacement became 31,400 tons. The main armament was increased to 12 14-in. guns arranged in four triple turrets in two superposed groups forward and aft. The secondary armament originally consisted of 22 5-in. guns, but has been reduced to fourteen. The protection of the vessels was generally similar to that of the "Nevada" and "Oklahoma," but the side armour was increased to 14 in. maximum. Turbine engines were fitted in both vessels of the class, the "Pennsylvania" having geared cruising turbines in order to secure economy.

The "New Mexico," "Idaho" and "Mississippi," launched in 1917, were similar in general design, protection, and main armament to the "Pennsylvania." The displacement was slightly increased to 32,000 tons. The main armament of 12 14-in. guns was again arranged in four triple turrets, with front plates of 18-in. armour, side plates 9 in. to 10 in. and roof plates 5 inches. The

secondary battery of 14 5-in. guns was fitted a deck higher than in "Pennsylvania" and was unprotected.

The "New Mexico" was distinguished from her sister vessels by the adoption of electric motors for her propulsion, the other two vessels having turbines arranged as previously; she had two turbo-electric generating sets of 11,400 kw. capacity installed, and this electric power was transmitted electrically to four motors of, nominally, 6,600 H.P., one on each of the four propelling shafts. These motors were reversible, thus avoiding, as in the ordinary turbine method of propulsion, the necessity for astern as well as ahead prime movers. The electric drive appears to have been successful, especially as the "New Mexico" was not originally designed for this method of propulsion; the accommodation for the machinery being obtained by modifications in the arrangement of the spaces provided in the original design for turbines, without affecting the other features of the design. The vessel was put through exhaustive trials with satisfactory results, a maximum speed of just over 21 knots being obtained at 31,200 H.P. on a displacement of 32,800 tons, with economical steam and fuel consumption. An advantage conferred by the electric drive at cruising ship speeds arises from the ability to obtain the necessary power from only one of the electric generating sets, which can thus be worked at nearly full power and therefore give very good efficiency. The "New Mexico" escorted President Wilson across the Atlantic, and on both eastward and westward voyages only one turbine generating set was used. The weight of the machinery was greater per H.P. than that of turbine machinery of about the same power in British warships, but it was considered that this was capable of improvement in the future, especially in the case of vessels intended from the outset to have the electric drive. The electric drive has been adopted for all succeeding U.S. capital ships.

The "Tennessee" and "California," launched in 1919, were practically repeats of the "New Mexico," the displacement being 32,300 tons. These vessels, however, have two funnels. Also a new system of under-water protection (which has since been adopted for all U.S. battleships) was introduced. This consists of five vertical longitudinal bulkheads extending parallel to the ship's side from the forward to the after magazines, thus protecting the whole of the vitals of the ship. The innermost bulkhead is about 17 ft. inboard, the other bulkheads being approximately equidistant from one another; the bulkheads next to the skin bulkhead and innermost bulkhead are all thin plating, the other three being of thicker plating; the middle three of the five spaces formed by this arrangement are utilized as oil-fuel bunkers.

In Aug. 1915 Congress approved the first building programme ever drawn up for the U.S. navy, according to which 10 battleships, 6-battle cruisers, 10 scouts (or light cruisers), 50 destroyers, 9 fleet and 58 coast submarines were to be added in three years to the U.S. navy, in addition to a number of auxiliary vessels.

The first battleships to be built under this programme were the "Colorado" (launched 1921), "Maryland" (launched 1920 and completed 1921), "Washington" and "West Virginia." The dimensions of these vessels are not greatly different from the "Tennessee," except that the displacement is slightly greater, being 32,600 tons, the H.P. of the electric propelling machinery being increased to 28,900 to maintain the speed of 21 knots. The chief departure in the new vessels was the adoption of 8 16-in. guns as the primary armament, arranged in four twin-gun turrets superposed in pairs forward and aft. The secondary armament consists of 14 5-in. guns. The armour protection is generally as in the "New Mexico" class.

FIG. 32.

The remaining six battleships of the 1916 programme had not yet been launched in 1921. Their names are "South Dakota," "Indiana," "Montana," "North Carolina," "Iowa," and "Massachusetts" (fig. 32). They are a very great advance on their predecessors, being 684 ft. long, 106 ft. wide and displacing 43,200 tons on a draught of 31 feet. An increased speed, 23 knots, is aimed at, the electric drive being of 60,000 horse-power. The main armament is increased by 50%, consisting of 12 16-in. guns mounted in four triple-gun turrets, and the secondary armament comprises 16 6-in. guns. The torpedo armament was two submerged 21-in. torpedo tubes throughout all the battleships described in the fore-

going. In 1919 a second three-year programme was considered, to consist of 156 vessels in all, including a further batch of 10 battleships and six battle-cruisers.

(2) *France*.—The French navy did not immediately adopt the single-calibre main armament, their first vessels, designed after the "Dreadnought" era had begun, being the "Danton" class, which resembled the "Lord Nelson" in armament, 12 9.4-in. guns being carried in addition to the usual 4 12-in. guns. They were about 2,000 tons heavier than the "Lord Nelson" and were fitted with turbines of 22,500 H.P., giving a speed of 20 knots.

The first French battleships of the "Dreadnought" type were the "Jean Bart" class, launched in 1911 and 1912. These vessels, "Jean Bart," "Paris," "France" and "Courbet," were a considerable advance on the "Danton" class, being 546 ft. long, as against 481 ft., with increased beam and draught, and displacement of 23,100 tons. Turbine machinery of 28,000 H.P. was fitted, giving a speed of 20 knots. The main armament comprised 12 12-in. guns mounted in six twin-gun turrets arranged in two superposed groups forward and aft, with the remaining two turrets on the broadsides amidships. The ahead and astern fire was thus 6 guns and broadside 10 guns. The secondary armament was very numerous, consisting of 22 5.5-in. guns protected by 7-in. armour. The side armour was 10½ in. thick, tapering to 7 in. at the bow and stern, the turret armour being also 10½ in. thick.

The "Jean Bart" successfully withstood torpedo attack by an Austrian submarine in 1915, being struck well forward. Compartments were flooded, but the vessel proceeded under her own power to Malta, where she was repaired in H.M. Dockyard.

FIG. 33.

The next battleships built by the French were the "Bretagne" (name ship of the class) (fig. 33), "Lorraine" and "Provence," all launched in 1913, practically repeats of the "Jean Barts," except that the main armament consisted of 10 13.4-in. guns mounted in five twin-gun turrets, all on the centre line of the vessels, the usual superposed groups of two turrets forward and aft, the fifth turret being amidships. The secondary armament again consisted of 22 5.5-in. guns, arranged slightly differently from the "Jean Bart," but this number was decreased after the war to 18, during a partial reconstruction when director-firing was installed on a new tripod foremost.

These vessels were the last battleships completed for the French navy, the completion of the five vessels of the "Normandie" class, launched in 1914 and 1915, having been abandoned, with the exception of the "Bearn," which has been converted into an aircraft-carrier. The "Normandie" class were designed to carry 12 13.4-in. in three quadruple-gun turrets, a unique arrangement. The four guns in each turret were arranged on two mountings, so that virtually they comprised two twin guns. The secondary armament was to have consisted of 18 5.5-in. guns. The machinery intended for these vessels was of an interesting type, consisting of a combination of turbine and reciprocating engines, the two inner shafts being driven by turbines and the two outer shafts by reciprocating engines, which alone were powerful enough to have given the vessels a speed of 16 knots, the full power of 35,000 H.P. being designed to give a maximum speed of 21 knots.

It was intended to have laid down in Oct. 1914 four battleships of the "Duchesse" type, but the outbreak of the war caused this intention to be abandoned. The vessels were designed to carry 16 13.4-in. guns in four quadruple-gun turrets, arranged in two superposed groups forward and aft. The displacement was to have been 29,500 tons, and, with combination turbine and reciprocating engine, a speed of 23 knots was anticipated.

It should be noted that during the whole war period the French Government dockyards, and many private yards also, devoted their whole capacity to the production of munitions of all kinds for the army; naval work being almost entirely relegated to the background.

No provision was made in the French naval budget for 1921 for the construction of any capital ships.

(3) *Japan*.—The "Satsuma" and "Aki" were the first battleships built in Japan after the "Dreadnought" era had begun. They were a development of the "Kashima" class, and therefore

resembled in type the "Lord Nelson." Launched in 1906 and 1907, they mounted 4 12-in. and 12 10-in. guns on a displacement of about 19,500 tons. Turbine machinery of 24,000 H.P. was fitted in the "Aki," giving a speed of 20½ knots. The "Satsuma," with reciprocating engines of 18,500 H.P., was 2 knots slower.

The first Japanese battleships of the "Dreadnought" type were the "Settsu," launched in 1911, and the "Kawachi," launched in 1912. The latter vessel was blown up in 1918 in a Japanese harbour by the explosion of her magazines. These vessels were of 20,800 tons and mounted 12 12-in. guns, arranged in six twin-gun turrets, one forward and aft on the centre line and the other four on the broadsides. The ahead and astern fire was thus 6 guns and broadside fire 8 guns. The secondary armament was 10 6-in. guns, mounted in an amidships battery protected by 6-in. armour. Eight 4-7-in. guns were also mounted. The armour belt was 12 in. thick amidships at the water-line and 9 in. above, with 5-in. armour forward and aft, the 12-in. guns were protected by 11-in. armour, and the conning tower by 12-in. armour. Turbine machinery of 25,000 H.P. was fitted, giving a speed of 20½ knots.

FIG. 34.

Large increases in dimensions and power characterized the next class (fig. 34) of Japanese battleships, 14-in. guns being adopted. These vessels were the "Fuso" and "Yamashiro," of 30,600 tons and 40,000 H.P., launched in 1914 and 1915 respectively, and the "Ise" and "Hyuga," of 31,260 tons and 45,000 H.P., launched in 1916 and 1917. The main armament consisted of 12 14-in. guns mounted in twin-gun turrets all arranged on the centre line of the vessel. Two turrets are superposed forward, with a similar arrangement aft, the remaining two turrets being abaft the forward and after funnels respectively. The first pair of vessels named mount 16 6-in. guns, and the second pair 20 5-5-in. guns, as the secondary armament in an amidships battery protected by 6-in. armour. The belt and turret armour is 12 in. thick. The speed of the vessels is about 22½ knots.

FIG. 35.

The next class of Japanese battleships are characterized by the fitting of 16-in. guns. These vessels were "Nagato" (launched 1919 and completed 1920) and "Mutsu" (launched 1920), of 33,800 tons displacement, and "Tosa" and "Kaga" (building 1921) of 40,600 tons displacement. The former pair of vessels mount 8 16-in. guns in four twin-gun turrets arranged in the now usual manner, with 20 5-5-in. guns as secondary armament. The latter pair of vessels were probably to mount 10 16-in. guns. The torpedo armament, which in previous vessels consisted of five or six submerged tubes, was increased to eight tubes, four of which are mounted above the water-line. The vessels were slightly faster than previous vessels, a speed of 23½ knots being intended, geared turbines providing the requisite power, which was about 46,000 in the "Nagato" and "Mutsu" and 60,000 in the "Tosa" and "Kaga."

Under the 1920-8 Navy Law four battleships were projected.

(4) Germany.—The "Dreadnought" type of battleship was adopted at once by Germany, the advance from the "Deutschland"

class (of the "Formidable" type) being made without trial as was done in some other navies, of vessels of the "King Edward VII." or "Lord Nelson" types. The first German "Dreadnoughts," were the four vessels of the "Nassau" class, launched in 1908. Shorter but wider and somewhat heavier than the "Dreadnought," the "Nassau," on a displacement of 18,600 tons, carried 12 11-in. guns in six twin-gun turrets, mounted one at each end on the centre line, and two on each broadside, thus giving an ahead and astern fire of six guns and broadside fire of eight. The secondary armament consisted of 12 5-9-in. guns, mounted in a battery protected by 7-in. armour. A large torpedo armament of six 17-7-in. submerged tubes was fitted. The water-line armour belt was 11½ in. thick, with an 8-in. belt above, and tapering to 5 in. forward and 4 in. aft. The speed was 19 knots, the requisite H.P. of 20,000 being developed by reciprocating engines.

The "Nassau" class was followed by the four ships of the "Helgoland" class (fig. 35), launched in 1909 and 1910. These vessels marked a considerable increase in dimensions and displacement. The 12-in. gun was adopted for the first time in these vessels, the Germans claiming that this weapon was the equivalent of the 13-5-in. gun then being adopted by the British in the "Orion" class. The "Helgoland" carried 12 12-in. guns arranged similarly to the 11-in. guns in the "Nassau." The secondary armament was increased to 14 5-9-in. guns and the six submerged tubes were of 19-7-in. diam-

FIG. 36.

eter. The protection was generally the same as that of the "Nassau" class. The speed was increased to 20-5 knots. The various increases involved a displacement of 22,440 tons and engines of 25,000 H.P., but the reciprocating type was still adhered to.

The "Kaiser" class (five vessels), launched in 1911 and 1912, were slightly larger and faster than the "Helgoland" class, being of 24,300 tons and 21 knots, but the main armament was reduced to 10 12-in. guns without loss of broadside fire, as they were arranged similarly to the British "Neptune" (designed two years previously), with one turret forward, two superposed aft and two broadside turrets *en échelon*, all guns thus being able to fire on either broadside. The secondary armament was unaltered and the bow torpedo tube was omitted. The armour protection was considerably increased, the water-line belt being of 13½ in. maximum thickness

FIG. 37.

tapering to 9 in., with an upper belt of 7½ in., the secondary battery above and both ends of the ship being protected by a like thickness. Turbine engines were installed for the first time in German battleships, the power being 28,000 for a speed of 21 knots, which was somewhat exceeded on trials.

The four ships of the "König" class (see fig. 36), launched in 1913 and 1914, were, with the exception of slightly greater dimensions and displacement, generally repeats of the "Kaiser" class in respect of number and calibre of guns and torpedo tubes and of protection. The main armament was arranged all on the centre line, as in the British "Orion" class, the amidships turret being, however, between the two funnels. An important advance lay in the increased oil-fuel (700 tons) capacity, previous vessels having only 200 tons.

The last battleships built by the Germans were the "Baden" and "Bayern" (see fig. 37), launched in 1915, two others of the class not being completed at the time of the Armistice. A very complete description of the "Baden" was given in a paper read by Mr. S. V.

Goodall before the Institution of Naval Architects in March 1921. The "Baden" and "Bayern" were about 3,000 tons heavier than the "König" class, the dimensions being increased proportionately. The chief difference, however, was in the main armament, 8 15-in. guns being mounted in four turrets on the centre line in two superposed groups forward and aft, as in the British "Queen Elizabeth." The secondary armament was increased to 16 5.9-in. guns, and the torpedo armament consisted originally of 5 23.6-in. submerged tubes, one forward in the stem and the other on the broadside forward and aft. The forward torpedo room was damaged by an under-water explosion and when repairs were made the torpedo tubes were not replaced. Turbine machinery of about 50,000 H.P. total was fitted, driving three propellers, and a speed of about 22 knots was obtained on trials. The main armour belt was 13½ in. thick, tapering to 6½ in. at the lower edge. Above was a belt of 10-in. armour extending to the upper deck. The secondary battery was protected by 6½-in. armour. Forward the side armour was 6 in. thick and aft 7 inches. The latter and a deck of 4½ in. thickness provided protection to the steering gear. The maximum thickness of armour for the barbettes, turrets, and conning tower was 13½ inches. Protection against under-water attack was provided by a longitudinal bulkhead 2 in. thick, set in about 13 ft. from the side.

(5) *Italy*.—The first Italian "Dreadnought" was the "Dante Alighieri," of 19,200 tons, launched in 1910. This vessel was then remarkable for the high designed speed of 23 knots and the adoption of triple-gun mountings for the main armament of 12-in. guns, of which 12 were carried in turrets all fitted on the centre line of the vessel. The turrets, funnels and masts were so disposed that the vessel could practically be described as "double-ended." The vessel was protected by a water-line belt of 10-in. (maximum) armour amidships and 4-in. at the ends, with an upper belt of 6-in., by which 12 of the secondary battery of 20 4.7-in. guns were protected. The remaining 8 4.7-in. guns were mounted in four twin-gun turrets on the upper deck. The 12-in.-gun turrets had a maximum thickness of 10-in. armour. Turbine engines of 26,000 H.P. were fitted; these developed 35,000 H.P. on trial, when 24 knots were attained. Three torpedo tubes were fitted.

The "Dante Alighieri" was followed by the "Conte di Cavour," "Leonardo da Vinci" and "Giulio Cesare," launched in 1911. These vessels were 3,000 tons heavier than their predecessor and mounted an extra 12-in. gun, making 13 in all, four of which were in two twin-gun turrets superposed above triple-gun turrets forward and aft, a further triple-gun turret being fitted amidships. This arrangement enabled an increased all-round fire to be obtained over the previous vessel. The secondary armament of 18 4.7-in. guns was carried in an amidships battery protected by 5-in. armour, which was above the upper belt of 9-in. armour, the water-line belt being 10-in. amidships and 4-in. at the ends. Turret armour was 10-in. and conning tower 12-inches. Turbine engines of 24,000 H.P. were fitted to give a speed of 22 knots.

FIG. 38.

The "Andrea Doria" and "Caio Duilio" (see fig. 38), launched in 1913, were slightly longer and heavier than the "Conte di Cavour," but except for an improved secondary armament of 16 6-in. guns fitted abreast the forward and after turrets, the changes were of a minor nature.

The "Leonardo da Vinci," blown up at Taranto in 1916 by the explosion of her magazine, was refloated and dry-docked upside down in 1919. After repairs she was floated out of dock still upside down and then righted. This operation reflects the greatest credit upon the Royal Italian Corps of Naval Constructors, who conducted the operations throughout. The vessel, will, however, not be restored as a warship, but utilized for a subsidiary service.

The last four battleships laid down in 1914 and 1915 for the Italian Navy, the "Caracciolo" class, have not been completed. They were to have been generally similar in size, armament, speed and protection to the "Queen Elizabeth."

(6) *Russia*.—The Russian navy has ceased to exist as an important factor, but technically the various classes of battleships built are of interest.

Following the construction of two vessels of the intermediate "Lord Nelson" type, four battleships of the "Petropavlovsk"
